COMMISSION.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our right trusty and well-beloved Councillor Sir William Erle, Knight; Our right trusty and right well-beloved Cousin Thomas George Earl of Lichfield; Our trusty and well-beloved Francis Charteris, Esquire (commonly called Lord Elcho); Our right trusty and well-beloved Councillor Sir Edmund Walker Head, Baronet, Knight Commander of Our most Honourable Order of the Bath; Our trusty and well-beloved Sir Daniel Gooch, Baronet; Our trusty and well-beloved Herman Merivale, Esquire, Companion of Our most Honourable Order of the Bath; Our trusty and well-beloved James Booth, Esquire, Companion of Our most Honourable Order of the Bath; Our trusty and well-beloved John Arthur Roebuck, Esquire, one of Our Counsel learned in the Law; Our trusty and well-beloved Thomas Hughes, Esquire, and Frederic Harrison, Esquire, Barristers at Law; and Our trusty and well-beloved William Mathews, Esquire, greeting.

Whereas it has been represented unto Us that it is expedient that inquiry should be made into the several matters herein-after mentioned.

Now Know Ye, that We, reposing great trust and confidence in your ability and discretion, have nominated, constituted, and appointed, and do by these Presents nominate, constitute, and appoint, you, the said Sir William Erle, Thomas George Earl of Lichfield, Francis Charteris, Esquire (commonly called Lord Elcho), Sir Edmund Walker Head, Sir Daniel Gooch, Herman Merivale, James Booth, John Arthur Roebuck, Thomas Hughes, Frederic Harrison, and William Mathews, to be Our Commissioners for the purposes of the said inquiry.

And We do hereby enjoin you, or any Four of you, to inquire into and report on the Organization and Rules of Trades Unions and other Associations, whether of Workmen or Employers, and to inquire into and report on the effect produced by such Trades Unions and Associations on the Workmen and Employers respectively, and on the Relations between Workmen and Employers, and on the Trade and Industry of the Country; with power to investigate any recent acts of intimidation, outrage, or wrong alleged to have been promoted, encouraged, or connived at by such Trades Unions or other Associations, and also to suggest any improvements to be made in the law with respect to the matters aforesaid, or with respect to the relations between Workmen and their Employers, for the mutual benefit of both parties.

And for the better discovery of the truth in the premises, We do by these Presents give and grant unto you, or any Four of you, full power and authority to call before you, or any Four of you, such persons as you shall judge necessary, by whom you may be better informed of the truth in the premises, and to inquire of the premises and every part thereof by all other lawful ways and means whatsoever.

And Our further Will and Pleasure is that you, Our said Commissioners, do, with as little delay as may be consistent with a due discharge of the duties hereby imposed upon you, certify unto Us from time to time, under your hands and seals, your several proceedings in the premises.

And We do further will and command, and by these Presents ordain, that this Our Commission shall continue in full force and virtue, and that you, our said Commissioners, or any Four of you, shall and may from time to time proceed in the execution thereof, and of every matter or thing therein contained, although the same be not continued from time to time by adjournment.

And for your assistance in the execution of these Presents We do hereby authorize and empower you to appoint a Secretary to this Our Commission, to attend you, whose services and assistance We require you to use from time to time as occasion may require.

Given at Our Court at St. James, the Twelfth day of February 1867, in the Thirtieth Year of Our Reign.

By Her Majesty's Command.

S. H. WALPOLE.

FIFTH REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners appointed to inquire into and report on the Organization and Rules of Trades Unions and other Associations, whether of Workmen or Employers, and to inquire into and report on the effects produced by such Trades Unions and Associations on the Workmen and Employers respectively, and on the Relations between Workmen and Employers, and on the Trade and Industry of the Country; with power to investigate any recent acts of intimidation, outrage, or wrong alleged to have been promoted, encouraged, or connived at by such Trades Unions or other Associations, and also to suggest any improvements to be made in the law with respect to the matters aforesaid, or with respect to the relations between Workmen and their Employers, for the mutual benefit of both parties, have held several meetings, and humbly beg leave to submit to Your Majesty the evidence given before us at our meetings held upon the 20th, 21st, 22nd, 27th, 28th, and 29th days of November 1867, and upon the 3rd and 10th days of March 1868.

(Signed) W. ERLE, Chairman.

WM. MATHEWS.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

APPOINTED TO INQUIRE INTO

TRADES UNIONS AND OTHER ASSOCIATIONS.

1, Park Prospect, Westminster, Wednesday, 20th November 1867.

PRESENT :

The Right Hon. Sir WILLIAM ERLE.	HERMAN MERIVALE, Esq., C.B.
The Right Hon. the EARL of LICHFIELD.	JAMES BOOTH, Esq., C.B.
Lord ELCHO, M.P.	FREDERIC HARRISON, Esq.
Sir DANIEL GOOCH, Bart., M.P.	WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. JOHN KANE examined.

Mr. J. Kane.
20 Nov. 1867.

8205. (*Chairman.*) What is the society of which you are the president ?—I am president of what is called the National Association of Ironworkers, whose headquarters until recently have been at Gateshead ; they are now at Walsall.

8206. (*Mr. Mathews.*) May I ask you what your occupation was before you became president of the National Association ?—A roller.

8207. How many years is it since you were a roller ?—It was in the beginning of 1864 that I left off rolling.

8208. Have you been a practical workman since 1864 at all ?—No, I have not since the month of March 1864, when I lost my situation in consequence of defending the Leeds and Low Moor men when locked out.

8209. Where did you work then ?—I worked for 28 years with Messrs. Hawkes, Crawshay, and Sons, at Gateshead.

8210. Do you reside now at Gateshead ?—I still reside at Gateshead.

8211. What is your occupation now at Gateshead, irrespective of being president of the National Association of Ironworkers ?—I have no other occupation except looking after the interests of the association, and travelling from place to place as circumstances may require.

8212. You do not keep a public house ?—No ; I have not such a misfortune.

8213. May I ask whether this is a paid office that you hold as president of the association ?—Yes.

8214. And may I ask, if it is not an impertinent question, what the rate of pay is which you have for undertaking this duty ?—140*l.* per year.

8215. What particular district do you take immediate charge of ?—At the present time do you mean, or during the past ?

8216. Recently, until the place of meeting was changed from Gateshead to Walsall ?—My duties have extended, since I accepted the office, from Cardiff in Wales to Motherwell in Scotland.

8217. In point of fact, this National Association of ironworkers embraces a very large area ?—A very large area.

8218. And your business has been to communicate with the different districts for the purpose of getting a joint co-operation between all the districts for certain objects ?—Yes, in the past that has been so.

8219. What is the number of the members in this National Association ?—I could not say what the number of members is exactly now, because since the last dispute that we had with the employers, commencing in July 1866, and terminating in the beginning of the present year, the suffering of the men and the depression of trade have been such that I should say the larger number of men have been recently non-paying members.

8220. Have you any idea what the total number was at that time of paying and non-paying members ?—Up to that period non-paying and paying members would number about 6,500. The *bonâ fide* members, such I mean as we could always rely upon, would be, say about 5,000.

8221. Have you any statement showing what the annual income is of this association ?—The annual income from July 1865 to July 1866, after paying off some very heavy claims consequent on the great lock out (what is called the national lock out of the iron trade in 1865) was something like 4,000*l.* gathered together in the various lodges.

8222. Was that the net income or the gross income ?—That was the amount after settling the other claims ; that was the amount of money we had in hand when the strike commenced.

8223. That was the cash balance in fact ?—Yes, the cash balance.

8224. I want to know the actual income of this association ?—The actual income at that time was 6,000*l.* ; it would not be anything like that now, not more than one-sixth of that.

8225. You think it would be about 1,000*l.* a year now ?—Yes, I should think it would ; but I wish the Commissioners distinctly to understand this, that an immense number of men are now out of employment. Those that are out of employment pay nothing —many of those that have employment, many in consequence of short time, are not expected to pay, nor can they pay even if we would desire it, and taking

Mr. J. Kane.
20 Nov. 1867.

that fact in addition to the very low prices to which the employers have reduced the value of labour, it now seems a very serious question whether the men can live or not.

8226. (*Sir D. Gooch.*) What is the proportion of the men in the union not paying to those that are paying?—I should think not above one-tenth of the men are paying at the present time.

8227. (*Mr. Mathews.*) I suppose that in the iron trade, owing to the depression of trade, a very large proportion of men are out of employment?—A considerable number are out of employment, and a considerable number are working short time, and there is a still larger number that are very badly paid for their labour.

8228. To what do you attribute the want of employment in the iron trade chiefly?—A reckless competition is, in my opinion, the cause of it, and the large number of works which have recently been established in the north of England, and the continuous desire on the part of some of the employers to undersell each other.

8229. (*Sir D. Gooch.*) How does a lower price of iron put men out of work; competition produces low prices, does it not?—Yes.

8230. How does that reduce the number of men employed?—I do not know that it reduces the quantity of iron made, it rather increases it.

8231. Then it affects the number of men employed by increasing it?—Unfortunately there have been instances, where men's wages have been reduced, by the men endeavouring to execute more work, and then those that are out of employment stand less chance of getting in.

8232. (*Mr. Mathews.*) Then do you make out that there is a larger amount of work executed by fewer men, does not the quantity of iron made regulate the number of men employed?—I think it can be proved in the following way: I know some of the works that formerly used to work only five heats at puddling, they are now with the same quality of iron working six.

8233. Would not the wages of the men be equivalent to the number of hours that each man worked?—It ought to be.

8234. Is it not so?—Not now.

8235. We will take puddling for instance, which is the first process and regulates the rest—is not the puddling paid by a certain rate per ton on the quantity of iron made?—Yes, undoubtedly.

8236. If a man works six heats instead of five he gets in proportion?—There has been a custom in the north of England that the men should be paid according to the quality of the pig metal.

8237. Still they are paid upon the ton?—Yes.

8238. Whatever the quantity of the pig metal, they are paid upon the number of tons produced per week from a given furnace?—Yes.

8239. If there is a great competition, and they make six heats instead of five, the puddler gets more?—That is in the event of their receiving more, which they do not always receive. Frequently strong grey pig iron is given to the men to work as six heat iron. I have known many disputes arise in consequence of the inability of the men to produce more than five heats in 12 hours.

8240. The earnings of the puddler must be in proportion to the number of tons of iron made, must they not?—There are some classes of iron that were paid as much as 18*s.* per ton in the north of England, what was called roasting iron. There were, however, other classes, such as hematite iron, which were paid prior to the dispute generally about from 11*s.* to 12*s.* per ton. The price that is now paid for it is not near so high as that. It is quite true that there is a cause to be assigned, namely, the fall in the price of iron, but (the arrangement is not carried out now to the same extent as formerly) there is a larger proportion of hematite mixed with common iron, which frequently causes the puddler to run into five heats where formerly he could work six.

8241. We will take the Middlesborough district, which is the largest district contiguous to you. In the Middlesborough district, taking the ordinary run of iron, would not the puddler earn more in six heats?—If he was working common iron he would get more for working six heats than he would get for working five heats.

8242. And is not the bulk of the iron made in Middlesborough iron of that description?—There is a considerable quantity made in that district for tops and bottoms for rails, cable iron, and plates.

8243. Have you ever considered what proportion of the cost of a ton of bar iron consists of wages exclusively without reference to the other ingredients constituting the charge? We will take bar iron to be now at 6*l.* 10*s.* a ton, what proportion of that 6*l.* 10*s.* do you consider as wages entirely?—I have not devoted particular attention to that question, and had I known that that would have been a question asked of me I would have prepared a suitable answer. I would not like to give a mere guessing answer to that question.

8244. If I state to you that taking a ton of bar iron at 6*l.* 10*s.*, upwards of 5*l.* 10*s.* consists entirely and exclusively of wages, would that be far off the mark do you think?—No, I should think not.

8245. Then in the event of a fall of 20*s.* a ton in the price of bar iron, does it not become absolutely necessary for the ironmaster, if he is not to stop his works, to reduce the wages in proportion to the reduction in the price of iron?—Yes; but I have to observe that the system of continual reduction does not necessarily increase the consumption. You have money very cheap at the present time, but nobody appears to care much for it. The speculators do not appear to have taken much advantage of it.

8246. A reduction of price in one district must operate all over England, must it not?—The best answer to that would be the number of mills now standing and the immense number of men now out of employment.

8247. When the price of iron was higher there was a good demand. Now there is a bad demand and the price of iron falls, is not that so?—Most undoubtedly, which has not necessarily increased the number of workers.

8248. Take large works at Middlesborough, Mr. Barningham's for instance, I suppose that Mr. Barningham furnishes about 1,000 tons a week?—About 850 tons with the mill he is now working.

8249. If Mr. Barningham furnishes 850 tons a week and the price of iron is reduced a pound a ton, that makes a difference of 850*l.* a week to Mr. Barningham?—Yes.

8250. And inasmuch as the cost of labour would be 5*l.* 10*s.* to a ton of iron out of the 6*l.* 10*s.* for which it is sold (assuming that to be the case), would it be possible for Mr. Barningham to continue his works without immediately effecting a reduction of the wages to his men?—I do not know that it would; but there is no necessity that Mr. Barningham, for the sake of impoverishing his men, should go into the market and take the orders lower than the market price. I understand that the manufacturers have their fortnightly and monthly meetings, and they have two separate organs to represent the interests of the trade. They know exactly what orders there are in the market, and if they go and seek orders at such low prices it is only fair to infer that the men could not live at such prices, besides, the men should be consulted in all matters which so seriously effect their social interests.

8251. Would it not be a necessity on the part of Mr. Barningham to reduce the wages in some degree equivalent to the fall in the price of iron or stop his works?—One of the alternatives must follow, but the standing argument of Messrs. Barningham has been Let us reduce the price of iron to the Welsh figure.

8252. Would he not be obliged to reduce the price of iron to the Welsh figure, being a competitor with the Welsh for making rails for instance?—I do not

think that he would, because there is a difference in the quality of the manufactured article.

8253. Whatever the quality of the rails, if the price of Welsh rails were to fall, would not Mr. Barningham be compelled to reduce in the same proportion?—That would depend upon the contracts and quality.

8254. If Mr. Barningham said, "I want orders for rails, and I must get orders or I must stop my works," would he not be compelled to go down in price in proportion to that of the Welsh rails?—If he were living from hand to mouth, but if he had a large contract on hand, and in consequence of the Welsh masters accepting contracts at a lower figure reduced the wages that he (Mr. Barningham) was paying, it might be that he would just gain double the profit which he formerly received by the reduction.

8255. If he has contracts upon one occasion at a high price, he would very likely have contracts on another occasion at a low price. Therefore we will put that on one side. I ask whether a reduction of 20*s.* a ton that Mr. Barningham is obliged to make to get orders would not involve the necessity either of reducing the wages of his men in the same proportion or of compelling the stoppage of his works, seeing that it would make a difference of 850*l.* a week to him if he were to reduce a pound a ton on the bar iron?—No doubt it is so, if you put the argument in that way.

8256. Mine is not an argument, it is simply a question?—I am quite prepared to admit that such would be the case as you put it, but the argument cuts both ways.

8257. I think you stated something about a strike which occurred sometime ago in the Middlesborough district and in North Staffordshire; there was a strike I think which happened when there was an attempt to reduce wages 12 months ago?—I may simply state that if we are to go into the question of strikes, we would have to go back beyond the North Staffordshire one, and now we have got into a curious method of defining strikes as lock-outs and lock-outs as strikes.

8258. I want to ascertain whether there was not a strike at Middlesborough, and in North Staffordshire, consequent upon a reduction in the price of iron?—I am not aware of any in North Staffordshire then. In the Middlesborough district there was.

8259. Was there not a strike also in North Staffordshire?—That was at the beginning of 1865.

8260. A little more than two years ago there was a general strike in all the districts, in fact?—I cannot say that there was a general strike; there was a strike in North Staffordshire and a lock-out in the other districts.

8261. Was there not a strike in Middlesborough then?—Not that I am aware of.

8262. If you recollect, I think I heard of your name as being tolerably active in connexion with that strike, both in Middlesborough and in North Staffordshire?—If you are referring to the time when the men were out in North Staffordshire we had no strike in the North of England then.

8263. There was a strike previous to that?—Yes, in connexion with the lock-out at Leeds in 1864.

8264. The strike arose from the ironmasters giving the men a notice of a reduction of 10 per cent., did it not?—In 1866 it did.

8265. The strike resulted; the men would not submit to a reduction of 10 per cent.?—Not exactly that. The masters stated 10 per cent. on puddling, but on mill work they put out no fixed scale until they put out what was called the revised list, which amounted in many instances to 60 per cent.

8266. I will take puddling as the general standard, was there not a notice given by the masters for a 10 per cent. reduction, incident upon a fall of 1*l.* in the price of bar iron?—Not in consequence of the fall of bar iron, but in consequence of the depression of trade. These reasons were assigned afterwards, but not at the time the notice was given.

8267. Was there not a reduction of 1*l.* a ton in the price of bar iron, and did not the masters in consequence of that say they must reduce the wages 10 per cent.?—The masters did not say so, inasmuch as the masters held a meeting in south Staffordshire shortly after, and declared that the price should remain the same for the next quarter.

8268. In the Middlesborough district I am asking?—No such reason was assigned.

8269. What reason was assigned for giving notice to the men?—It is stated there (*handing a report to Mr. Mathews*).

8270. The notice given by the masters is embodied in this printed form. "In consequence of the depressed state of trade, notice is hereby given to all "the men employed at these forges and mills that "they must consider their engagement with *. . . "at an end on Saturday, July 14th, 1866, unless it be "arranged before that day to continue the works in "operation at a reduction of one shilling per ton on "puddling, and not less than 10 per cent. on forge "and mill men's wages and contract prices connected "therewith." This states that the notice was given in consequence of the depressed state of trade. I suppose "the depressed state of trade" means a fall in price?—That may or may not be, but it did not put it in the form you do.

8271. I will put it thus; was not the notice given in consequence of the depressed state of trade in the district?—We have always been in the habit of considering that the South Staffordshire prices regulated the prices elsewhere, and that the initiative for a rise or fall in wages took place there. The men, therefore, considered that the whole affair was something novel, and certainly very unpleasant, in consequence of the masters in the north taking joint action against the men.

8272. Was not this notice given in consequence of the depressed state of trade in the Middlesborough district?—The masters assigned that reason in that statement, but I know that at the time there were none of the works standing.

8273. "The depressed state of trade" would imply that there was a reduction in price, would it not?—It might, or it might mean men working short time at good prices; men do occasionally work short time at good prices.

8274. But men do not work short time at good prices. This notice was given according to this printed form, "In consequence of the depressed state "of trade in the Middlesborough district," and the "depressed state of trade" means of course a fall in the price of iron?—Yes, but the employers declared they were paying above the current rates.

8275. Would it be possible for masters with a reduction of 20*s.* a ton in the price of iron to carry on their works paying the previous rate of wages without ruining themselves speedily?—If such were the state of things it would not be possible; but the men did not believe that, in consequence of an arrangement having been come to with the employers in the north.

8276. I want to ascertain whether the masters did not allege that there was a depressed state of trade in the Middlesborough district, which meant that the price of iron was reduced, and whether the reduction in the price of iron did not involve a reduction in wages?—I may simply state that according to the notice it evidently meant the depressed state of trade. But another reason why the men did not believe it was this, that every workman in the North of England was working full time, and the returns of the Board of Trade may form a fair criterion. A depression of trade means executing less orders; instead of less there were more.

8277. So that in order to make the men consistent in their opposition to the reduction in the price, they assume that the masters are not stating the truth when they state that there is a depressed state of trade?—No doubt of it, and they are not always in the habit of believing that the masters speak the truth, and I am

Mr. J. Kane.
20 Nov. 1867.

sorry to say that there is too much reason for not always believing some of the employers.

8278. I think you took some active part in that strike?—I did.

8279. And with the fact that the cost of labour was 5*l.* 10*s.* a ton, it would be impossible for a master to continue his work without an equivalent reduction in wages, would it not?—The employers in the North of England have great advantages over Wales and Scotland, which are the two places that they have most to compete against. They are adjacent to a seaboard. It is not so in Staffordshire, and it is not so in some of the other districts, and their mines can be worked much cheaper.

8280. The Middlesborough employers you say have an advantage over Wales and Scotland—in what does that advantage consist?—In being able to get the work done much cheaper than in the other places.

8281. Are you aware what the price of puddling is in Wales?—I am, it is 5*s.* a ton for some qualities.

8282. What is it in Middlesborough?—The present price in Middlesborough for what is called common iron, I think, is 8*s.* per ton and 7*s.* 6*d.*

8283. (*Mr. Harrison.*) Is that the same class as the Welsh at 5*s.*?—No, it is superior iron to what they have in Wales.

8284. (*Mr. Mathews.*) If you pay as a medium price 8*s.* for puddling in the Middlesborough district (and the rate for puddling regulates in the rough the wages paid in other departments), what advantage does that give the Middlesborough people over the Welsh who pay only 5*s.* for puddling?—In Wales they can do with a boy, in the North of England they must have a very strong man.

8285. But that would not make the difference between 8*s.* and 5*s.*?—Where the price is so low in Wales they can bring out 34 cwt. a turn; in the North of England the make does not exceed 22 cwt. and a half per ton.

8286. The cost per ton would be the same in proportion?—Not exactly. If you can bring the same work out of the same furnace, 34 cwt. instead of 22 cwt. and a half, it must necessarily assist the employers very much in meeting any extra expense, or competing against any other party supposed to be a rival in the market.

8287. You do not know probably about the cost of pig iron and the wages paid in forming pig iron?—Not particularly.

8288. When I made use just now of Mr. Barningham's name I merely mentioned Mr. Barningham's name as an illustration of the general Middlesborough trade, Mr. Barningham being one of the large employers. The questions that would apply in the case of Mr. Barningham would apply in the case of all the other large Middlesborough masters, Messrs. Bolckow and Vaughan, Messrs. Hopkins and Company, or works of a similar character to theirs?—They would, but we have not had so much trouble with Messrs. Hokings & Co., as with Barningham, the men have been able to settle their affairs much easier with the former firm than with the latter.

8289. There is no truck in the Middlesborough district, is there?—Undoubtedly there has been, and there may be now for anything I know to the contrary. There is a very large shop near the railway station, and the men from Messrs. —— firm were in the habit of occasionally taking notes to that shop.

8290. That has not been made matter of complaint and grievance, has it?—Not recently; Mr. Roberts put it down.

8291. We may assume now that there is no grievance existing of which the men complain on the score of truck?—Not that I am aware of.

8292. Reverting to my former question, I want to ascertain whether it is possible in the case of a large ironwork, assuming a reduction in the price of iron of 20*s.* per ton, for the ironmaster to continue his work without an equivalent reduction in the rate of wages?—I should think not, but a reduction below present rates with short work, higher house rent and higher priced food will demoralize the workmen by increasing pauperism.

8293. So that if an ironmaster finds occasion to reduce his wages in consequence of a reduction in the price of iron it cannot be called tyranny, it is simply a matter of necessity?—May I ask whether you put that question to me in connexion with the late dispute?

8294. I ask it in connexion with all disputes?—My reason for asking the question of you is this, that the masters published a code of rules wherein they stated that prior to any dispute taking place a conference of masters and men should be held. Now when the late notice for reduction was given that was entirely overlooked.

8295. Was a conference held with the employers?—No.

8296. Was there any conference held in any other district with the employers during the late strike?—I am not aware of any.

8297. Was there a conference held in North Staffordshire?—I am not aware, not to my knowledge. I believe that some gentlemen in North Staffordshire took a very active part in endeavouring to get up a conference, and had an interview with some of the men, but as to a conference of employers and employed, I am not aware that such a thing took place, at any rate I was not present at any.

8298. You took an interest in promoting a meeting in North Staffordshire?—No. I have stated that the rules of the masters in the north of England made the arrangement that prior to anything in the nature of a strike or lock-out being likely to take place in consequence of a reduction in the selling price of iron a conference of the men with the employers should take place.

8299. Are you speaking now of the Middlesborough district?—Of the North of England.

8300. You think that the occasion of the strike on the part of the men in the Middlesborough district was that the masters would not hold such a conference, is that so?—I do not know if that was the only cause of it. All the reasons assigned by the employers were laid before the men.

8301. Do you mean that the masters laid before the men the reasons on which they acted?—They were expected to do so, but they did not do so.

8302. Did they not state in this notice which I have already read, that they had given notice of a reduction, because of the depressed condition of the iron trade?—Yes, but the men required proof.

8303. Was there any doubt about that?—Yes, the return of the board of trade caused a doubt, and the fact of nearly all the works working full time.

8304. Would the return of the board of trade give any intimation as to prices or as to the effect of the exportation of iron upon the manufacture?—If there was a depression of trade the manufactured tonnage would necessarily be less, I should think.

8305. Have you any doubt that this "depression of trade" meant a reduction in the price of iron?—I have no doubt that such a construction could be put upon it.

8306. Have you any doubt of the fact?—I am not aware that any general reduction in the price of iron had taken place. This impression is confirmed by the South Staffordshire ironmasters deciding to reduce the selling price of iron.

8307. (*Sir D. Gooch.*) The Board of Trade return does not show the home consumption of iron?—No, but the works being fully employed would show that.

8308. (*Mr. Mathews.*) Supposing that there is a large exportation of iron (which the Board of Trade alone takes cognizance of) may not that be consistent with a large falling off in the home consumption?—In that case the works would be working short time.

8309. And it would be in consequence of the state of the iron trade being depressed that the men would work short time?—But they did not work short time until afterwards. If the reasons had been clear, and

such as you have stated, that is to say, if the men had been suffering from depression of trade, and working short time, say three or four days per week instead of five or six, I do not believe that there would have been such great objections on the part of the men to accept the reduction.

8310. Is it not a serious loss to a master to work half time ?—No doubt of it.

8311. The master would work full time as long as he could, until the reduction in the price of iron compelled him to stop ?—I think it is not the custom of masters in the north of England to work rails on stock in such a case save where they have a contract.

8312. (*Sir D. Gooch.*) As soon as the contract was run out there would be a depression of trade ?—Yes.

8313. And the master must look forward to that time ?—Yes.

8314. There has been a depression of railway trade since that period, has there not ?—Yes.

8315. (*Mr. Mathews.*) You being the president of the ironworkers union, the men would naturally confer and advise with you as to what was to be done in the event of a reduction of wages and why there was a reduction of wages ?—The printed form that was sent out by the employers we sent to every lodge within two days after it was issued by the employers. There was three weeks notice given by the employers, and we showed very clearly I think, at least we endeavoured to show, that if the men resisted it there was nothing for them to depend upon but starvation.

8316. That is to say, there was nothing to do but stop the works ?—The works were stopped. The employers appeared determined to make a serious reduction.

8317. That would be the natural result ?—We endeavoured to show that from all appearances the masters were determined to carry out their intentions so far as they were embodied in the notice, and I stated before that one of the chief causes of resistance to the notice was the indefinite character of that part of the notice which refers to the mill men, the reduction amounting in many instances to 60 per cent.

8318. But you, being the president of the Ironworkers' Association, and advising the men (which your experience and discretion qualified you to do, I daresay) upon all points relating to resistance to a notice, would be fully acquainted with the state of the market as to the price of iron just as well as a master. That would be a part of your business, I presume, for you would not be competent to advise the men unless you had more information than the men themselves. It would seem naturally to follow that you had information about the state of the trade, and you would admit, I suppose, that you did possess that knowledge ?—Of course it has always been my duty to get all the information I could on such matters.

8319. No doubt you would get as much information on this point as any ironmaster was capable of getting. The public papers would enable you to know whether there was any change. All that information you would possess, and possessing that knowledge did you deliberately advise the men to strike against this reduction ?—I did not.

8320. In point of fact the men struck because they did not like a reduction of wages although there was an admitted necessity on the part of the ironmasters that the wages must be reduced ?—I am not prepared to have it put in that form. I have stated that the mill men and the puddlers were all in one society. I am certain that the puddlers would have settled much sooner but for the fact of standing out in defence of the mill men ; the prices that were attempted to be taken off mill men and the shinglers amounted to 50 or 60 per cent.

8321. (*Sir D. Gooch.*) There is nothing in this notice about 50 or 60 per cent ?—No.

8322. It is "not less than 10 per cent." 60 per cent. is a large jump from 10 per cent. ?—But another notice was put out; they put it out then in the form of what was called a revised list. But the men had opportunities of appointing deputations to wait upon the employers, and the information they received was such as this. To illustrate the matter, I may say that the price for shingling was formerly 2*s.* 4*d.* and 2*s.* 2*d.* per ton. The price was distinctly reduced to 1*s.* and 1*s.* 3*d.* per ton, as was stated to the deputations, and of course, the men all being members of one society, the puddlers could not go to work without the shinglers.

8323. (*Mr. Mathews.*) In ordinary cases what would the earnings of a shingler be ?—I think you will agree with me that there is no such thing as an average price. In one sense the price may be averaged, but the results will not be an average. Hence I have known some shinglers work for 7*s.* per day, and from 7*s.* to 10*s.*, and I have known others getting 1*l.* and 25*s.*

8324. At the present time, I believe, some of the works in the North of England have stopped from an unwillingness to reduce the men further, and from an absolute impossibility to continue the works at the present wages without a very great loss at the existing price of iron ; is not that the case ?—I believe that Mr. Barningham has assigned a reason of that kind, but it is also known that Mr. Barningham has made the purchase of a large quantity of old rails which he can use instead of puddled iron.

8325. Has not the same course been adopted at Messrs. Bolekow and Vaughan's ?—I believe the notice was issued last Saturday, but since then I do not know that the men are working full time.

8326. I want to ask you whether, with the existing price of iron at Middlesborough, it would be possible to continue the works without a further reduction in the wages of the men ?—I should think it would. I see no reason why the prices should be reduced to the same prices as in Wales, which is the reason assigned by some.

8327. They are not going to be so low, are they ?—It would be reduced equally as low if you take into account the advantages which the men in Wales possess. House rent is much cheaper there.

8328. Without reference to the prices paid in Wales, but taking the existing price of iron, is it not an absolute necessity either to stop the works, or to reduce wages in some degree proportionate to the fall of iron ?—If the reasons assigned are strictly correct, no doubt it would be so.

8329. In point of fact, would it not be the best policy instead of having these continual strikes and lock-outs for the men to accept the situation as well as the master, and to co-operate with the master as far as they could ?—I think that the best way of preventing these things would be the establishment of local courts of arbitration. Where suspicion is entertained on either side, I think that the best way would be to have boards of arbitration, and the evidence itself would be perfectly conclusive either one way or the other.

8330. Are you aware that an arbitration has been proposed to the men and that they have rejected it? —I am not aware that arbitration has ever been proposed to the men over whom I have exercised any influence.

8331. I ask with reference not to Middlesborough, but Staffordshire ?—I believe that there was a peculiar kind of arbitration proposed to the men in North Staffordshire which they have rejected.

8332. What was the peculiarity ?—The peculiarity was that one gentleman (the Earl of Lichfield I think) was to be the only arbitrator.

8333. Could there have been a better arbitrator ?—I think not. If it were in my case I should have accepted it. I am not aware what reasons the men assigned for rejecting it.

8334. (*Sir D. Gooch.*) Do you know the present price of rails in Middlesborough ?—From 5*l.* 15*s.* to 6*l.* 10*s.*

8335. That is not a higher price than the price in Wales ?—There is a difference of 4*s.* to 5*s.* in getting the iron out of the mine.

Mr. J. Kane.

20 Nov. 1867.

8336. You said before, did you not, that the Middlesborough iron was better than that in Wales?—I wish it to be understood that I am now referring to the very lowest price; the price paid in Wales very much depends on the quality of the rails.

8337. Taking such rails as the English railways use there is not much difference in that, is there?—Yes; there are some contractors who will have a certain quality with width of pile. All Barningham's rails are drawn out under the hammer, and he generally gets a good price for them.

8338. Would he get more than 5*l.* 15*s.*?—No doubt of it. When I give the figures that I have given I am simply quoting from what I see in the papers.

8339. I understand from you that the Middlesborough prices are higher for rails than the Welsh prices?—So they generally are. I suppose that in the North of England they can either make rails or manufacture them; that is to say, they can manufacture good or bad rails.

8340. (*Mr. Mathews.*) Do you know anything of the rate of wages paid in Belgium for iron?—If I may take the statements of Mr. Williams I know something of them.

8341. You know nothing personally?—No, I have never been there.

8342. Are you aware that Belgium iron is coming in in considerable quantities?—I am aware that it has always been coming in; but in the papers it has been much larger than the tonnage in ships.

8343. There is no doubt that some comes in?—No.

8344. (*Sir D. Gooch.*) Do you think that the Belgian iron will affect the foreign trade of this country?—I do not expect it will. If you reduce the iron in that county you will be compelled to reduce it here. The only cure would be to prevent the Belgian manufacturing it cheaper; but how you are to carry that out I do not know.

8345. By competing here I presume?—If you reduce the workmen much lower they will not be able to live.

8346. (*Mr. Mathews.*) I want to ascertain whether as a matter of opinion you think that it would be possible for the English iron to come into operation if it cost 30 or 40 per cent. more than the Belgian?—I think it would on condition that you let the workmen have a certain portion of land in this country to call their own, as they have in Belgium.

8347. (*Sir D. Gooch.*) Could you make farmers of them?—Every man, I should say, if he had any sense might cultivate some ground.

8348. (*Mr. Mathews.*) Is there anything to prevent the ironworkers here taking land of their own if they choose?—Want of cash.

8349. (*Sir D. Gooch.*) Would a man puddling all day be able to attend to farming?—In the case of the Butterly Company each of the men has garden ground and a certain portion of ground to grow potatoes on.

8350. (*Mr. Mathews.*) Is there anything to hinder other workmen doing the same?—In South Staffordshire they would find some difficulty in finding gardens, I should say.

8351. In ordinary circumstances are there not the means for them to have land, if their taste lies in that direction?—There are many reasons that might be assigned; perhaps they could get the land, but a puddler is probably more migratory in character than almost any other workman.

8352. (*Sir D. Gooch.*) But is it not the interest of the masters, and do they not try to a great extent to fix men on the land by comforts of that sort, inducing them to build their own houses, and so to get a hold upon the place?—It is the interest of the masters, so far as the North of England is concerned, to have a settled class of men, and if possible to have them live in their own houses.

8353. When the workmen do live in their own houses that is the desire of the masters?—I do not think that any one of them would oppose it. I do not know that they would take an active part in promoting it.

8354. (*Mr. Mathews.*) You think that one way of obviating strikes and locks-out in the iron trade as in other trades, would be to establish some tribunal where the masters could confer with the men?—I feel assured that that is the only cure, and that it is a very necessary one.

8355. At all events perhaps you would be of opinion that strikes and lock-outs are very prejudicial to the interests of the masters?—They are very prejudicial to all classes, and like war, leave the track of misery behind them.

8356. It would be a great blessing if means could be devised that would put a stop to them?—If there are any legitimate means that would secure fair play to both parties it is essential that they should be adopted.

8357. (*Sir D. Gooch.*) Supposing that such a tribunal settled that the wages should be so and so, and the masters could not afford to go on with those wages?—You might reverse the case and say, supposing the men could not go on with what the tribunal appointed, I think that in their case it would be just as serious.

8358. A man could live upon less, but a master could not live upon nothing?—But you see more paupers made of the men than you see bankrupts made of the employers.

8359. You know that there are a good many ironmasters that have not prospered?—I should think so; several of them have not recently. But the reason why I think that arbitration is the most safe and sure plan to settle all disputes is this, that it comes to be a question of figures. If the employer cannot carry on the work at higher wages, and the workmen are bound by the decision of the arbitrators, they are bound to go to work. Let that be the preliminary condition, I would say.

8360. (*Mr. Mathews.*) Would not there be this question still open in the event of arbitrations being established, if the arbitration were against the master he would say "Very well, I will employ the men, "but I can not employ more than one-third of the "number I employed before, because I must limit "my operations into the smallest possible compass." On the other hand, if the arbitration were against the men, the men would say, "Very well, we cannot live at that, and we must seek employment elsewhere"?—Yes.

8361. That would qualify in a great degree the advantages of arbitration, would it not?—In the event of the men being compelled to leave the district that would be less calamitous than a general strike or lock-out as the case might be.

8362. (*Earl of Lichfield.*) Can you tell us what have been the average earnings of the men you speak of over the last few years?—Wages in the iron trade fluctuate so very much that it would be a difficult thing to strike an average. You had in 1863 three advances you may say in six months, and now in nine months, or at any rate since the men have resumed work at the beginning of the present year up to the end of the year you will have had three reductions.

8363. What has been the lowest rate of earnings during the last three or four years?—The lowest rate that has been paid during the last four years has been 7*s.* 6*d.* per ton.

8364. What would that represent in the shape of wages a day or a week?—In the event of a puddler being able to get what is called his regular heats, that is six heats per day on a certain quality of iron, he would be able to bring out say 22 cwt. on the average at 7*s.* 6*d.*, or we may say 22½ cwt. to supply it. He would then have to pay probably out of that 3*s.* 4*d.* per day to an under hand, then the difficulty is to fix an average in consequence of men losing so much time. Anything occurring to the furnace, for instance, may delay the work. I should think that the average earnings during the last 12 months, even assuming that the men have had an opportunity of working six

days in a week, or rather five days, have not exceeded for puddlers 24*s.* a week.

8365. (*Mr. Harrison.*) Why do you say five days?—There are some of the works that do not work on the Monday, and when they are working at nights they can only work five nights in the week, commencing on Monday night.

8366. (*Earl of Lichfield.*) What would be the rate per week at 7*s.* 6*d.* per ton. I mean about what would it be, because you say you cannot get it exactly because there is some loss of time?—I have no hesitation in stating that, taking the majority of the puddlers in the north of England at the present time, assuming the present rate of wages for the 52 weeks, their earnings would not exceed 24*s.* a week. That is the very outside.

8367. You say that 7*s.* 6*d.* per ton is the lowest rate you are aware of for the last few years?—That is the lowest rate.

8368. (*Mr. Mathews.*) Assuming that the men are on short work?—No, not assuming that they are on short work.

8369. That is a ton a day, and they have to pay their under hand out of it?—Yes, but you are forgetting that they cannot work every day; I thought you meant by "short work" short of orders.

8370. Whether from their being short of orders or any other cause I mean?—I am referring to accidents to the furnace, and the furnace going badly, and the under hand not being there to do his work.

8371. (*Earl of Lichfield.*) What is the highest rate which you are aware of their having received per ton during the last three or four years?—That which is now paid at 7*s.* 6*d.* was formerly 9*s.*, 9*s.* 6*d.*, and as high as 10*s.* 6*d.*

8372. I do not ask you any questions with regard to what you said as to the refusal of the North Staffordshire men to accept the arbitration proposed to them, beause I think I understood you to say that you knew nothing of the circumstances?—Nothing but what appeared in the newspapers.

8373. Did the association of which you are the head give any assistance to the North Staffordshire men after they had refused that arbitration?—Individual lodges or works did by voluntary contribution; but not generally as an association.

8374. Was that done by your advice?—No, it was not.

8375. Did you give any advice upon the subject or express any opinion upon the subject at the time?—I went down to North Staffordshire and advised the men to resume work in consequence of the men that I represented having decided at the previous conference to accept the 10 per cent. reduction, namely, at Sheffield in the beginning of the year.

8376. I am referring to what took place after the arbitration was refused?—No advice was given by us after arbitration was refused either one way or the other; we were taking no part in the affair.

8377. You said that the arbitration which had been proposed to the men was such an arbitration as they could not approve of, because it left the matter entirely to one person, that person being myself. Do you think it very probable that if those had been the terms of the arbitration proposed the masters of South Staffordshire would have accepted that arbitration as they did, seeing that I knew very little about the iron trade?—Of course in a matter of this kind you can only ask for my individual opinion; I may simply state that so far as the arbitration itself was concerned the men objected, as I have been given to understand, in consequence of the arbitration being supposed to be one sided.

8378. You are aware that the masters had agreed to accept it?—I understood so.

8379. (*Mr. Booth.*) How do you propose that the board of arbitration which you suggest should be composed?—As far as I have been able to understand the question, I think that it should be composed of say six workmen and six employers, with a chairman who should not be connected with either party, whose decision should be binding.

8380. From what class would you take the chairman?—I should leave that to the men and the masters themselves. The chairman should be appointed by the consent of both parties.

8381. (*Lord Elcho.*) If they differed, what then?—Not being confined to one man they should endeavour to select another.

8382. (*Chairman.*) It constantly happens that two parties cannot agree on one man?—I think that in each district some independent gentlemen could be found who possess the confidence of both sides.

8383. (*Sir D. Gooch.*) You would make the chairman not one of either of the masters or of the men, but independent of both?—Yes; but I would have no objection to any other machinery that would be calculated to secure a fair investigation of the facts on both sides.

8384. (*Mr. Mathews.*) Do you think it would be possible to choose a higher referee, both in social position and otherwise, than a gentleman like Lord Lichfield?—I do not think it would.

8385. And the men declined to take Lord Lichfield as arbitrator?—The men declined. No doubt prejudice had something to do with it, not against Lord Lichfield as a gentleman, but because his lordship belonged to a certain class who are representatives of capital. If this representation had been made "We have selected Lord Lichfield, and you shall have the privilege of selecting another to converse with him about the matter," it might have been different. I think that it was a lamentable affair, and it would have been much better if it had been settled in that way, but the men thought differently.

8386. (*Chairman.*) If there was arbitration are you of opinion that the award could bind for any length of time, say six months or even one month?—I think so. I think it would be valueless unless an arrangement of that kind was come to.

8387. Have you ever known such an arrangement acted upon where there has been a considerable change in the price of iron?—No, I have not; but Mr. Henderson, the member for Durham, informs me that they have had no strikes in their trade for years, and they settle all their disputes by that process.

8388. (*Mr Mathews.*) Is Mr. Henderson an ironmaster?—He is in a certain sense, he is the chairman of the Consett Iron Company; but I am referring now to the carpet trade.

8389. (*Lord Elcho.*) Do you know what the constitution of the court or board is in that case?—I do not know. He simply stated that they have a joint meeting of representative men and employers, and they invariably settle the disputes without the vexatious policy or the disasters of either a lock-out or a strike.

8390. You do not know how the chairman is chosen?—No.

8391. Have you studied the working of courts of arbitration abroad?—I have read what Louis Blanc has written on the question so far as France is concerned.

8392. Have you been in Paris at this Exhibition?—I have not.

8393. You have said that you thought that one of the reasons why the Belgians can take lower wages than the workmen in England was that they had land. Do you know for a fact that they have?—I know for a fact that they have no law of primogeniture there, and that the land is in possession of the people.

8394. Do you know for a fact that these Belgian workmen who have lower wages than the English workmen, have each a piece of land?—In the general case I should think they have.

8395. When you say that in the general case they have, upon what authority do you say that?—There was a work written lately by Mr. Fisher on the "Food of the Peoples of Europe," and in that work he supplies some very valuable statistics of the number of landed proprietors in Belgium.

Mr. J. Kane. 9 Nov. 1867.

8396. But does he supply statistics from which you have gathered the fact that the Belgian puddlers have each a piece of land, and that it is in consequence of their each having a piece of land that the Belgian puddlers can work at lower wages than the English puddler?—It is from Mr. Fisher's book that I have been able to gain a considerable number of facts. No doubt the fathers of families have a piece of land—indeed he states that; but I do not suppose that young men have.

8397. You gave as a specific reason for their being able to take lower wages that these Belgians were in possession of land. I want to know whether you can state that as a fact?—Do you wish me to state that each Belgian puddler has or has not?

8398. Yes; to state from your own knowledge that the Belgians have each their farms, and that it is through their farming that they are able to take lower wages than the English puddlers?—It would be impossible for me to say that each Belgain puddler has land. Of course the land falls into the hands of the members of the family in proportion as the fathers die off. In the case of several of the young men who commence life as puddlers, of course the land that belonged to the father does not belong to them until his death.

8399. You have not been in Belgium yourself?—No.

8400. But you have drawn general inferences from a book on the "Food of the Peoples of Europe," by Mr. Fisher?—Yes, just as other people draw general inferences from the work of Mr. Williams the ironmaster.

8401. (*Mr. Mathews.*) Assuming that the Belgian puddlers have land, do they rent it or not?—The land is their own.

8402. What law is there in Belgium that invests them with the land rent free?—The law of buying it.

8403. Cannot a puddler buy land in England if he wishes?—Yes he can, but in Belgium the land is frequently divided because the law of entail is not in existence.

8404. The Belgian puddler has the opportunity of buying land and the English puddler has not, is that it?—No, an English puddler can buy anything provided he can find the means to buy it.

8405. The Belgian puddler cannot buy it without means?—Any puddler who has worked in Belgium will know very well that working the quality of iron that is worked in Belgium does not require the same amount of manual labour that working it in England does. My information as to that is gathered from men who have worked in Belgium.

8406. My information is that the work is very similar in both countries?—There is a good deal of iron in Belgium that is charcoal iron.

8407. That is a very small proportion, is it not?—There is a considerable proportion of that. Besides, if this iron is mixed with the other it will assist the working.

8408. Is there as great a proportion of charcoal iron made in Belgium as in England?—I think there is.

8409. I will assume that the conditions of the Belgian workman are very much like those of the English workman, that the Belgian workman has to apply the same skill and ingenuity in puddling iron as the English workman. You say that in Belgium the conditions of the workman are rendered more advantageous by his being able to buy land, cannot the English puddler do the same?—Yes, but he will find it cheaper in one country than in the other.

8410. Do you think that it is cheaper in Belgium than in England?—My impression is that it is.

8411. Mine is that it is dearer?—That is one of the reasons that has been assigned, and another reason is that the people of Belgium are not so heavily taxed as the people of this country.

8412. (*Earl of Lichfield.*) What is the difference of wage between this country and Belgium?—Taking the difference of wage between this country and Belgium, and also the difference in the cost of living, I should say that they would be about equal, as Mr. Bell showed in the paper which he read at Dundee. The wage of one country is lower than the wage of the other taken by itself.

8413. (*Mr. Mathews.*) The English ironmaster would work at a disadvantage compared with the Belgian, so far as wages constitute an ingredient in the cost of iron?—I suppose he would, unless he can make it up in some other way; if he can work it more economically, or if he has coal cheaper in this country, he may make it up in that way.

8414. Has he coal cheaper?—There is more economy in Belgium, as I understand, in the use of coal.

8415. (*Mr. Merivale.*) Did you ascertain anything about the hours of labour in Belgium, whether the day's work is greater than here?—About 40 or 45 puddlers came over to Leeds in 1864 from Belgium, and these puddlers informed me that the hours were much shorter in Belgium than in this country.

8416. Did they tell you how much shorter they were?—They stated that it was seldom that a puddler worked more than nine hours in that country.

8417. (*Sir D. Gooch.*) Would not that stop the mill, because the work must be standing during six hours out of the 24, if they only work nine hours at a time?—A puddler cannot be expected to be always there, the mill has to be stopped at the end of the shift, and all that is required during the week is simply to throw a little water on to the coal that is put into the furnace.

8418. But during the 24 hours that the furnace is kept going, one man goes on for nine hours, and then goes off, and another comes on, that still leaves six hours?—It takes a certain length of time before you get the furnace in proper order. Supposing that a puddler has done with his work in nine hours in this country, then he has the same furnace put in order for the party that is to follow him.

8419. (*Mr. Mathews.*) Could he do his work in nine hours?—That would depend upon the kind of metal employed.

8420. If he did would it not be necessary to go on for two hours longer, in order to keep the furnace in full operation?—To go an extra heat? No; I have not found that they endeavour to do anything of the kind, and I hope they would not, because I think that the great fault of the people of this country is working too long hours.

8421. (*Mr. Harrison.*) You spoke in the earlier part of your evidence about truck having been practised formerly in a district which you are acquainted with, namely, at Middlesborough. To what extent did that go, and what form did it take?—The form of having a shop. The men received a note to take to the shop, and had such goods as they could supply there.

8422. Was that carried to a great extent?—It was carried to a great extent at one time in connexion with certain firms. They have a shop at——, but I am not prepared to say that it comes under the form of truck. It is not generally understood to be carried out in the north now; it is done away with in almost every instance. The way it was done away with in Middlesborough was this: the prosecution of one or two cases took place, and of course the parties were compelled to pay over to the men the whole of the money that had been paid to them in these tickets. I am not prepared to say that anything of the kind is carried out now; but it was formerly carried out in the North of England.

8423. Were the union or any combination of men amongst themselves instrumental in procuring the abolition of the truck system?—In one instance the union took a very active part in endeavouring to abolish truck at a work called Dundivan in Scotland. The men were out then for 14 weeks I think it was. The dispute was first about price, and after we succeeded in settling the dispute about price the men refused to go to work unless the truck shop was abolished, and it was ultimately abolished after 14 weeks strike. The name of the firm is Henderson

and Dymock. I may simply say that the men there are now carrying out truck as much as ever they did, and the men themselves, if I mistake not, asked for its restoration on the ground that they were all in poverty and that they could not succeed in getting provisions elsewhere in the absence of ready money, and Messrs. Henderson and Dymock commenced the shop again. That is at a place called Coatbridge in Scotland.

8424. Was that a case where the pays were what are called long pays?—The pays were monthly.

8425. Do you consider that if the pays had been weekly the workmen would have had no temptation to ask for a system of truck or to submit to it?—Not to the same extent; the temptation will always exist when men have been trained under the system.

8426. (*Sir D. Gooch.*) Are not there always fortnightly draws where monthly pays exist?—Frequently so.

8427. (*Mr. Mathews.*) Whenever there is a monthly pay is it not in your knowledge that any man wanting money goes to the office and gets it if he wants it?—I know that they often go to the office, but not that they get it when they want it.

8428. Has any case come to your knowledge where the masters have refused to advance money at the request of the men?—Yes; many cases of that kind, especially in South Wales.

8429. It is rather the exception than the rule, is it not?—There is in some works an arrangement by which the men receive 17*s.* out of the pound, in others 15*s.*, in others 10*s.*

8430. (*Sir D. Gooch.*) In South Wales all the ironworks have fortnightly draws, have they not?—In South Wales, at one of the ironworks named Rhymney, they have a fortnightly draw, and it is in the discretion of the cashier, the men themselves have told me, to determine the amount that he shall advance in each case.

8431. He must judge of the amount that the man is likely to have done, I presume?—In that case they have a larger draw.

8432. (*Mr. Harrison.*) Do you know whether, in your own district the existence of the union has been instrumental in suppressing the truck system, or do you consider it now instrumental in preventing any practical recurrence to it?—Not in the North of England district, inasmuch as the truck was destroyed before the union was established by the individual action of the men.

8433. Do you consider that there is any danger of anything approaching it being recurred to?—Not in the North of England; co-operative shops are very general there.

8434. Is there any part of England in which it has come under your knowledge at all or in which you have reason to believe that there is practically a species of truck system in existence?—Yes; at a place called Neath, in South Wales. There is an ironwork two or three miles from it belonging to a certain firm. In those works they have a peculiar method of evading the law. They issue what are called notes; the notes come down to 1½*d.*, and extend up to 1*l.* These notes are given to the men, and they take them to a certain shop or public house, and they are taken to a small Neath bank and cashed there by a sort of arrangement with the bank. Such was the state of things when I was there in 1864. These notes are taken to the company's shop, and stand instead of money.

8435. (*Mr. Merivale.*) Would one of the notes be taken by another shop not a company's shop?—By the public house it would.

8436. (*Mr. Harrison.*) Do you know whether there is anything like a general practice of that, or is this the only case you know of?—I should say that generally speaking truck is carried on directly or indirectly in Wales. At Sir John Guest's at Dowlais they have nothing of the kind, and I am not aware that they have anything of the kind at Crawshay's works in Merthyr. They have a peculiar system at another place. The men receive a note at the office, and this note is taken to the shop. The note is in the form of a loan —"We agree to lend you so much."

8437. (*Mr. Merivale.*) You say that in the former case the public house will take the notes at Neath; do you suppose that that is by any arrangement between the public house keeper and the issuer of the notes?—I should think so. The party that I received my information from was the man who kept the public house.

8438. (*Mr. Mathews.*) If a man pays wages in a public house, either directly or indirectly, is he not liable to pay them over again?—Yes.

8439. And is an ironmaster likely to pay wages at a public house with that liability to pay them over again?—It does not come in the form of wages; it is a loan.

8440. Still it is an advance on loan?—No doubt it is; whether it is likely or not it is frequently done there.

8441. (*Chairman.*) Did the publican tell you that he gave a man less beer for a note for 1½*d.* than he did for 1½*d.* in copper?—No.

8442. The evil of the truck system is that you go to the shop of the proprietors, and they give you as 10*d.* worth of tea, for instance, what you could get for 9*d.* at a fair shop?—I have seen several cases of that kind at Moss End, in Scotland, where cheese was supplied which was more like soap than cheese.

8443. (*Mr. Harrison.*) Are pays longer in Wales, as a general rule, than they are in England?—Yes, they seldom have less than a month. In Rhymney works they have five settling days in the year.

8444. What is the average in England?—The average in England is fortnightly, in many instances weekly, but there are very few cases where it is more than fortnightly.

8445. Is there any instance of the employment of women in ironworks in England in the actual operations of the works?—I am scarcely aware of any; there may be some isolated cases where a woman is employed, but not in the common drudgery of the work.

8446. Is there anything of that kind in Wales?—A great deal; I have seen women in Wales emptying large waggons and putting down coals near the firegrate for charging the furnace with; I have seen them assisting in taking hold of the wheels of the large carriages to bring the metal away from the blast furnaces.

8447. Do you consider that the general condition of the iron workers in Wales is not fully equal to that of those in your own district, for instance?—I believe that the employment of women in Wales has a great deal to do by way of cheapening labour to such an extent as to make it a standard argument that it is a difficult thing to compete with Wales.

8448. Are the earnings of a man in Wales, who is a puddler, for instance, and of a man of precisely the same skill and industry in Staffordshire or Middlesborough different, or does he gain the same in the two cases?—No; the prices are generally lower in Wales. They have a peculiarity in some of the works, for instance, in Mr. Fotheringill's, of this nature—from the price for which the men work there is a deduction of 2*d.* per pound for making, mending, and repairing of tools.

8449. There is no regular organization of workmen's union in Wales at all is there?—No, there is not.

8450. Do you connect the greater prevalence of the truck system, of the longer pays, and of the labour of women, and the inferior social condition of the ironworkers in Wales as compared with that of Staffordshire or the north, with the want of a strong union organization?—I believe that the cause of a good deal of the social degradation of Wales is long pays, bad prices, and truck; and the men themselves feel and admit all this to be true when they come down to the north of England. Those evils would have been destroyed before now if there had been a general

Mr. J. Kane.

30 Nov. 1867.

union in Wales. That sort of thing does not exist in the north of England or Staffordshire; I believe that an attempt has been made to introduce a truck shop in one place at Staffordshire, but it is not a general rule.

8451. Do you think, supposing the workmen throughout Wales were to succeed in forming themselves into a powerful union, whether in connexion or not with the unions of England, that in the first place they would desire to do away, and that in the second place they would succeed in doing away with these evils which you have been speaking of?—I do believe so; considering the immense number of ironworkers in Wales. I should say that there are fully 10,000 ironworkers in South Wales. I do not refer to women or yet to boys, but what you may call *bonâ fide* ironworkers, that is to say, men employed at the rolling, the furnaces, and the operation of puddling.

8452. (*Mr. Merivale.*) Can you at all tell what number of others, such as labourers and the like, you should add to those 10,000 in order to make up the whole number of men employed?—I have not specially devoted much time to the consideration of that matter, but I should think that the fair proportion would be four to one.

8453. (*Mr. Harrison.*) Have you ever had any instances brought to your notice in which men who have made themselves prominent in union matters or in strikes have found a difficulty in obtaining employment, or have been, as you consider, arbitrarily dismissed?—Many instances of that kind. I found that in Scotland there was a person of the name of John Matthews who walked about the country for two or three years and could not find a situation.

8454. What do you attribute that to?—It was in consequence of the active part he took in destroying the truck system at Dundivan. In the North of England again, there was a notice issued immediately after the dispute, and when a man went to any of the employers and asked for a note of discharge, they would give him a note with the following on it: "John "so and so left our employment on such a date, "having declined to accept the reduction." Of course when such a man came to any other of the employers they said, "We know what you have been after," and declined to take him. There is a person who was an ironworker of the name of George Thomas, who is now endeavouring to get a living by selling half a pound of tea or any odd work he can get. He waited upon Mr. Hopkins; Mr. Hopkins told him that he would never find employment in the North of England.

8455. That man is living in England?—Yes, at 17, Grey Street, Vaughan's Buildings, Middlesborough.

8456. (*Chairman.*) At previous sittings of the Commission workmen have come with a black list stating that they were not to be employed, and the masters that followed came with a black list of masters. It is a perfectly well known thing to you, probably?—Yes.

8457. (*Mr. Harrison.*) Do you know the fact of any such black lists having been circulated among employers containing the names of men who are obnoxious?—I would not swear that there have been such lists circulated, although I have not the slightest doubt that the names of such men are sent to employers.

8458. You never saw a printed list of that kind?—No.

8459. Are there any districts in your trade in which the houses that the workmen live in are to any large extent owned by the employers with whom they work?—Yes, it is so with the Consett Company; I should say that most of the houses—90 per cent. of the whole of the houses of the Consett men—belong to the company. It is a limited liability company, of which, I believe, Mr. Henderson is the chairman, and the managing director is Mr. Priestman.

8460. Have any instances ever been mentioned to you in which the threat of eviction of the families from the houses of the workmen has been used in cases of strike or lock-out, or anything of that kind?—Yes, it is very common, the men have frequently received notice that unless they came to an agreement they would have to leave their houses on a certain day; that is to say, in the event of their not being willing to go to work on certain terms. That has been resorted to, and slight acts of violence have followed, for which parties were tried at the Durham assizes, and for the destruction of some property at Witton Park where they are living in the company's houses, but the property which was injured I do not believe belonged to the company.

8461. You mean that they had been previously turned out of their houses?—Yes, several houses are standing empty in consequence of notices for eviction. I have also known that during the Leeds dispute the masters gave all their men notice to leave their houses. A few men stayed, and those men were charged 7*s.* per week instead of 3*s.* 6*d.* That was in Lowmoor.

8462. (*Mr. Mathews.*) Is not it the ordinary law of England that after notice the rent may be raised?—Yes, but it was used as a means of coercion.

8463. (*Mr. Harrison.*) You mean that this notice of eviction was not entirely for nonpayment of arrears of rent?—No.

8464. (*Mr. Mathews.*) But in case of the men not being employed again, would it not follow that the masters would require the houses for the men who would come in in their stead?—Yes. In a case which I named before, that of Henderson and Dymock in Scotland, the men were turned out of their houses and camped in the fields for a time.

8465. (*Mr. Harrison.*) In point of fact the houses were not required for other people to go into, but it was used as a threat to induce the men to come to terms?—Yes.

8466. You spoke just now of some injury to property for which men have been brought before the magistrates. Could you say, generally speaking, how many cases of outrage, distinct violation of law, have been proved before the courts as originating in an union, or ordered by the officers of an union?—I am not aware of one case that was ever ordered by the officers of an union.

8467. Are you prepared to say that you have known no such case?—I have known cases of outrage, but not where it has been ordered directly or indirectly by the officers of an union. No such case ever came before me, and I have no knowledge of any such case. I remember one case, which occurred during the time that the men were out for 28 weeks in North Wales. Some men from Shropshire were doing these men's work. I met Mr. Whalley there, the member of Parliament, and fortunately one morning when I was to hold a meeting with the men, a document was put into my hands signed by a collier (who it was written by I do not know), urging upon the men to get hold of staves and use violence in driving these Shropshire men out of the works. I told the men that if they attempted to do anything of the kind I should at once leave them and publish a letter in the papers, stating that I had ceased to hold connexion with the ironworkers. It was prevented, and I succeeded in settling the dispute on the same day.

8468. Could you give other instances in which the union or its officers have done everything in their power to suppress resort to illegal measures?—I know that the tenor of the various remarks and speeches at all the meetings which I have been at has invariably been to the effect that the men should observe the law and not violate it. There were some men prosecuted in 1864 in Leeds. Those cases resulted in the first instance from shouting "Black sheep," and so on. The men were punished; but in each case it was the individual action of the men. No prompting was ever given by any of the officers that I am aware of.

8469. Do the union men in your district, as a rule, refuse to work in the same shop with non-union men?—Not at all; and we have no rule that states that union men are not to work with non-union men.

8470. As a matter of fact do they work together?—Yes.

8471. Is there any inconvenience to which non-union men are subjected by the union men when working together?—I have known cases where the non-union men have complained; but I have known cases where the men have complained of the same thing before there was any union. For instance, they have complained occasionally, because the workmen would not assist them, but I have known many such cases, hundreds in fact, during my experience, before any union was thought of by the ironworkers. Men have always their likes and dislikes, some men they will assist whether union or non-union men, and others they will not assist. But I have not known anything like a systematic arrangement being entered into for the men to throw obstacles in the way of non-union men, or to refuse to render them that necessary amount of assistance which is expected in a large establishment. There may have been occasionally things of that kind, but not of any serious consequence.

8472. Does the union enforce rules with respect to apprentices?—No, there is no apprenticeship system in connexion with the iron trade at the present time; there was formerly, but there is not now.

8473. And the use of boys is a matter perfectly open?—Perfectly open.

8474. Are the under hands members of the union?—In some cases they are, and in others not.

8475. Have the under hands, where they are not members of the puddlers' union, a union of their own?—They have not.

8476. Does the question of objection to overtime, excessive hours of work, arise as a practical matter in your trade?—Very frequently.

8477. What is the policy which the union adopts in that matter?—In the event of men not being able to get their heats out in the stipulated time that must be done in consequence of the new set of men coming on. The arrangement of the men has been to lay this grievance before a committee, and then to appoint a deputation to wait on the employers.

8478. Have they been kept 12 hours at work?—I have known them there 13 or 14 hours.

8479. How can the others come on in that case?—They are obliged to work on each others turns.

8480. Then overtime is a practical evil?—Yes, they have to work overtime without the advantages of overtime; without getting extra pay.

8481. Does that arise from the quality of the materials or the implements?—Generally speaking, from the quality of the material, the iron being greyer than what was arranged.

8482. But do you mean that there is no case of pressure being put upon the workmen to work longer than they would of their free will work for an increased rate of wages?—I have known in certain cases men discharged if they give over for less than six heats, and at the same time they could not get the six heats unless they worked 14 or 15 hours.

8483. Has the union interfered? Is it generally speaking the policy of the union to prevent that?—It has frequently interfered, but not recently, for this reason, that it is not considered sufficiently powerful; the masters say now that their day has come, and no doubt they are now more powerful than the men, and arrangements are now in operation which, if there was plenty of work in the country, the men would not submit to for a day.

8484. But do you find, as a fact, that for instance, the length of the hours of work without increased advantages, that is to say, without increased pay, or even with an increased rate of pay, has been greater at times when the union has been weak than when it has been strong?—The advantage to the employers is invariably greater when the union is weak.

8485. I am asking simply as to the hours of labour now?—The hours of labour when the union is weak are generally longer. Unfortunately we have had disputes thrown upon our hands in consequence of the class of iron. The men were engaged to work common iron. The arrangement is in every instance where common iron is worked that the men shall get six heats. It frequently has occurred, and is occurring now, that instead of six heats they give over with five. If they give over with five, the loss is entirely to the fore hand; he has to pay the under hand the same amount of money.

8486. (*Mr. Mathews.*) Is it not the custom to limit the number of heats in the 24 hours?—Yes, but it is a great advantage to the ironmaster if he can get a man to work a stronger brand instead of a weaker one for the same price.

8487. Do you think that the masters generally who make their own pig iron regulate the quantity of iron according to the demand?—Yes.

8488. Do you think that in case of a depressed state of trade the ironmaster who makes his own pig iron regulates his own pig iron so as to make bad iron instead of good?—No; I would rather think that he would regulate the quality of his metal so as to make good iron instead of bad.

8489. He makes the best iron he can in any case, and that iron is uniform when he makes his own?—Yes, to his own advantage.

8490. (*Mr. Harrison.*) I want to know if you could give us actual figures, or could hereafter furnish us with figures to show this. Taking an average first-class puddler, who is an industrious man and works as long as he has the opportunity, say in the course of this present year since last Christmas, what do you take to be his average earnings for the year? I am not supposing that he is always at work, but making an allowance for those weeks when he is out of work, what would the average be?—I understand that you want the average earnings during the last year of a man who has worked five days per week. There may be exceptional cases, but take the body of men such as you have at Messrs. Hopkins or Messrs. Hawkes, Crawshay, and Sons, or at Wilton Park Works. After paying the underhand and after paying the lighting up turn (the first turn in the week they have to work two days work for one, one for lighting the furnace up, and so on and the other is for working first turn,) I should think that the average earnings during the last 12 months, in the event of men working five days in the week, has not exceeded the figure which I gave formerly; at the very outside it would be 24*s.* a week.

8491. I understand that that was calculated for the weeks that they were at work?—Yes.

8492. But now I ask you to take the case of an average man who is on the whole fortunate in finding employment, what is his average over the year including the weeks when he has been wanting and cannot get work?—It would not exceed 1*l.* per week.

8493. (*Sir D. Gooch.*) I understood you to say that the 24*s.* was taken upon the average, making the allowances for loss of time?—Yes, under the most favourable circumstances.

8494. Under ordinary circumstances, you put it at that, did you not?—But then the man runs the risk of being out of work owing to the under hand occasionally not being there or the furnace being out of repair, without taking into consideration the scarcity of orders.

8495. (*Mr. Harrison.*) I understand you to say that, taking the broken days and broken weeks, and broken hours, when a man is regularly at work he makes on the average 24*s.* a week while he is at work, but as no man is at work every week for the whole year, if you take the whole year for an average man it is 20*s.*?—Yes.

8496. (*Earl of Lichfield.*) Why is he not at work for the whole year?—There are occasionally breakages, or there is absence of the under hand. Puddlers, probably, suffer more from loss of work than almost any other class of men; they cannot work without their under hand.

8497. You are putting it at five days per week?—Yes.

8498. At 7*s.* 6*d.* per ton?—Yes.

8499. And six heats a day?—Yes.

Mr. J. Kane.

20 Nov. 1867.

8500. And how many cwt. to a heat?—Four and a quarter is the general custom, but the average charge in the North of England, I should say, is nearer $4\frac{1}{2}$, that is $4\frac{1}{4}$ long weight is supposed to be the usual charge.

8501. I meant how many heats does it require to turn out a ton?—It would very much depend upon the quality of the iron; the quality of the fettling also would have a great deal to do with it. Some kinds of fettling wash the iron out of the furnace; for instance, what is called bulldog; it may improve the quality of the iron, but it has a great deal to do with the yield. The amount that a man should turn out for five heats is $18\frac{1}{2}$ cwt.

8502. (*Mr. Mathews.*) If he charges $24\frac{1}{2}$ cwt?—The average in that case should be $22\frac{1}{2}$ cwt.

8503. (*Mr. Harrison.*) With respect to this question of wages, could you furnish us on returning home from actual books kept or from actual figures with evidence that the average of the first-class puddlers would amount to the figure which you have stated?—I think it could be done in consequence of the following fact:—There is a custom in the north of England that each puddler receives the weight of iron that he works on what is called a pay note, and in the event of any of the men having taken care of any of these pay notes there would be little difficulty in forming correct averages.

8504. With respect to the question of the diminution of wages following in precisely the same ratio as the reduction of price, there is no mathematical necessity, is there, that a reduced price, even of iron, should be followed by a proportionate reduced price of wages, though it frequently must be so?—I should think that there is, to speak honestly and fairly.

8505. Let me put to you this case: supposing that a reduction of say 10 per cent. in the price at which the goods are sold is followed, as sometimes is the case though not always, by vastly increased production, perhaps a doubled production, then it would be possible to continue that production (provided of course that the margin which the difference between wages and price leaves were not too far infringed upon) retaining the old rate of wages or reducing them at a very much less ratio, and at the same time for a greatly increased profit to be left to the manufacturer?—I have not known of any such case.

8506. Take the case of coal, for instance; labour is a very large proportion in the cost of coal is it not?—Yes.

8507. The price at which coals are sold frequently varies enormously without a similar variation in the wages paid, does it not?—The price of coals as far as the iron trade is concerned generally rises and falls with the iron in the manufacturing districts.

8508. To the same extent?—I am not prepared to say to the same extent.

8509. (*Mr. Mathews.*) In the same relative proportion?—In the same relative proportion.

8510. (*Mr. Harrison.*) For instance, again the prices at which cotton goods have sold within the last century have been reduced enormously, have they not?—Yes.

8511. Yet the wages which are paid to the men who manufacture that cotton have stood even or have rather risen, have they not?—Yes. There have been many cases where improvements have been introduced as far as the manufacture of iron is concerned; but I would fail to be able to answer your question satisfactorily, or to state that the deduction which I think I perceive to be embodied in your question would necessarily follow, showing in the event of the men that might be retained at work being able to produce double the quantity of iron without any extra labour on their part. Now it is not so. Taking the improvements, as far as puddling is concerned for instance, I am scarcely aware of any within the last 30 years. There has been recently an attempt carried out in a few places of working what is called a double furnace. The man charges 9 or 10 cwt. instead of $4\frac{1}{2}$, but there is a strong lad and a man employed by him, whereas the ordinary process is for the puddler to employ one. The process of working is just the same as it was 30 years ago, but the amount of labour puddlers say is a great deal more than it was then; and hence I do not know that the same principle that has operated in the cotton trade by the improvement of machinery, and so on, would really answer as far as the iron trade is concerned.

8512. (*Sir D. Gooch.*) You do not do puddling by machinery yet?—We do not do puddling by machinery. I should be very glad to see it. I think that there would be more sense in that than in a man's broiling his face over melting metal.

8513. (*Mr. Harrison.*) You, as president of the union, then would not set your face against machinery?—No not at all.

8514. (*Mr. Mathews.*) Is your association partly a benefit society as well as a trades union?—It has not been except in respect of paying so much money in the event of the death of a member or a member's wife.

8515. There is no insurance for sickness?—There has been no sickness allowance, but an arrangement is now made to pay sick money which will commence with the next year.

8516. You do not know what the operation of that will be?—No.

8517. (*Lord Elcho.*) I see in the "Programme of business" in your report of the conference at Walsall, this: "Superannuation and sick benefit funds, funeral "donation, and Sunday fettling. As these four "questions were laid before you prior to the Glasgow "conference, and deferred for the consideration of "the forthcoming conference, we beg of you to recon-"sider them and supply your delegate with your "views and decisions thereon." What was the question, was it whether these funds should be established or not?—Yes.

8518. What is "Sunday fettling?"—The workman going into the forge on the Sunday to put his furnace right for work on the Monday morning instead of doing it on the Monday, and commencing on the Monday night.

8519. Is he not paid by the employer for that?—No. It is the old established custom that each puddler shall put his furnace in proper order for work.

8520. Why is it put down here, is it proposed that the allowance shall be given to him?—The reason is that it may be done on Monday instead of Sunday, inasmuch as many of them have scruples about doing it on the Sunday.

8521. (*Mr. Merivale.*) Doing it on the Monday, the object is that they shall have the same wages for the week, I suppose?—No, they cannot do that, they are paid by the ton.

8522. (*Mr. Mathews.*) Let me take you back to the North Staffordshire strike once more. I think you stated that within your knowledge the workmen of North Staffordshire refused the mediation of Lord Lichfield in the attempt to settle the dispute?—Yes.

8523. Was there not a recommendation on the part of the trades unions in London that the men should continue the strike and not accept arbitration?—I believe that some of the trades unions in London did recommend that course, but I had no connexion with it.

8524. It was not under any advice of your association that that was done?—No, we took no action in the matter as far as that is concerned on the offensive.

8525. Individually you did not recognize that movement at all yourselves?—We did recognize it at first, and the result was this, that at the Sheffield conference it was arranged for the men to accept the reduction of 10 per cent.—it was in December 1864, when the masters held a joint meeting.

8526. (*Earl of Lichfield.*) In December 1864 the masters proposed to reduce the wages 10 per cent.?—Yes.

8527. And the Sheffield conference was held at that time?—Yes.

8528. (*Mr. Harrison.*) Do you know if any of the large societies connected with the working of metals

in London were parties to recommending the men to refuse that arbitration?—I am not aware of anything of the kind. If I remember correctly, the opinion of the engineers and the moulders was in favour of arbitration. I think there was a split among the trades in London on the subject.

8529. Do you know whether there were any of the great amalgamated societies which recommended the refusal of that arbitration?—No, not to my knowledge.

8530. (*Mr. Mathews.*) Do you know the fact that the recommendation came from the trades unions in London?—I know that it came from a portion of them.

8531. (*Mr. Harrison.*) Did it come from the Trades Council?—I think not; I think that the London Trades Council reprobated it.

8532. (*Mr. Mathews.*) I will put the question with reference to that association of which Mr. Potter is the organ; did not Mr. Potter recommend that they should not accept the arbitration?—I would not swear that he did; my impression is that he did.

8533. And did not he say that if the North Staffordshire men would hold out a little longer they would succeed in getting good wages; that was the state of the case was it not?—Yes, I think that was the advice which was given. The reason why the North Staffordshire men were not supported by our men as a body was in consequence of the protest entered into by the majority of our men, a resolution being passed by the conference at Sheffield to the effect that the men should accept the reduction of 10 per cent.

8534. Have you any journal of your proceedings on the occasion of which you have spoken which you could put in for the use of the Commission?—Yes, I will endeavour to supply you with a copy.

8535. Will you put in all the printed documents that you have?—Yes.

8536. (*Earl of Lichfield.*) How was that Sheffield conference called; was it called by your association?—Yes, by circular.

8537. Can you give us any report of what took place at that conference?—We can give a condensed report.

8538. Were the North Staffordshire men represented at that conference?—Eight delegates were there from one of the North Staffordshire districts.

8539. (*Mr. Mathews.*) Do you recollect the names of the delegates representing the North Staffordshire districts?—We have them printed, and I can furnish them in print.

8540. (*Earl of Lichfield.*) Was the question of the North Staffordshire men resisting a reduction of wages at that time discussed at that conference?—I think it was, but during the time of that discussion I was not in the room.

8541. Was there any resolution passed at that conference with reference to the North Staffordshire men resisting the 10 per cent. reduction?—None.

8542. (*Mr. Mathews.*) I think you stated that the association with which you are connected, as far as concerned the Middlesborough district, determined to co-operate with the North Staffordshire men?—No; I referred to a protest that was sent to us and a refusal on the part of the men, or the various committees acting for the men, to send money to North Staffordshire.

8543. I think the Middlesborough men came to a resolution to act for themselves?—The question was brought on at a meeting that was held at Darlington by the masters. There was a formal request made on the part of the masters who attended that meeting after the failure of the York meeting, and one condition was that the connexion was to be broken, it having been pointed out by Mr. Dale and others that they did not know how to deal with us in consequence of there being two separate unions, and that therefore they had better be separated or be all one; and seeing that there was no prospect of all being one the delegates who were at that conference decided to carry out the previous resolution that no further correspondence or connexion should be held with the south in consequence of failing to attend at the York meeting, and considering the necessary expense thrown upon the men of the north, and that the meeting was virtually valueless in consequence of their absence. That was the chief cause of that resolution being passed.

8544. Have you discontinued your connexion with your Middlesborough association of workmen?—Not at all.

8545. But I think you stated that you now consider the head-quarters to be at Walsall, in Staffordshire?—Yes.

8546. Then how is it that if the arrangement was made to discontinue the connexion of the other district with the Middlesborough district your head-quarters have been removed from Gateshead to Walsall?—In consequence of it being the desire of the men of the north of England, Scotland, and Wales that there should be one union instead of two.

8547. Your head-quarters are now at Walsall instead of Gateshead, are the whole of the districts now connected with you?—Not the whole of the districts, we have the mill men of the North of England with us, but the West Bromwich men and the Brierly men we have no connexion with.

8548. How is it that you have your head-quarters at Walsall instead of Gateshead, the fact being that the larger number of associated unions of Staffordshire have nothing to do with the Middlesborough union?—Simply for this reason, that it was done by vote of the conference and by vote of the members. A conference was held at Wolverhampton some time ago, namely, on the 29th of October 1866, and at that conference it was decided for the officers to remove to Derby. That was never carried out, but the question was again brought up at the recent conference at Walsall. It was then decided by the delegates that it should be removed to Walsall, but it was thought better to appeal to the members. The members were appealed to, and were by a large majority in favour of Walsall.

8549. (*Earl of Lichfield.*) How do you account for the North Staffordshire men deciding on resisting that reduction notwithstanding the decision at the conference where all the men were represented?—I account for it from the existence of two separate unions; there were only three delegates from Brierley Hill, and they represented the whole of the union connected with Brierley Hill.

8550. Was that union represented at the conference at Sheffield?—By three of its leading men, but they would consider that they were not bound by anything done at that conference, inasmuch as they had a separate council and a separate association. A delegate meeting was called on the 14th of February, if I remember correctly.

8551. Was the decision of the North Staffordshire men given at that time?—The decision of the North Staffordshire men would be given at the meeting held on the 14th of February at Brierley Hill.

8552. Do you mean by that that the North Staffordshire men belonged to the Brierley Hill union?—One-half of them; the men in the Tunstall district belonged to Brierley Hill, and the men in the Hanley district belonged to what was called the National Association.

8553. Was the decision of the Brierley Hill union upon that subject different from the decision of the union which you represent?—Yes, they decided that the North Staffordshire men should stand out.

8554. The Brierley Hill association decided that you mean?—Yes, the delegates that attended that meeting on the 14th February.

8555. It was immediately after the Sheffield meeting?—Yes, a fortnight after.

8556. I understand by that that those who represented the Brierley Hill union were dissatisfied with the decision arrived at at Sheffield?—Probably they were; I am not in a position to state.

Mr. J. Kane.

20 Nov. 1867.

8557. At any rate the result was that they had a meeting immediately afterwards, and that at that meeting they decided that the North Staffordshire men should resist the reduction?—Yes.

8558. Then at that meeting, that you refer to at Brierley Hill, did the Brierley Hill union undertake to support the North Staffordshire men in the event of their resisting the reduction?—There was no doubt that that would be done, but Mr. Hobson is here to give evidence on that.

8559. At any rate I understand that, so far as the association that you represent is concerned, you took no part in supporting the North Staffordshire men during the strike which began in 1864?—Yes we did, having a district in North Staffordshire, the Hanley district. The employers in one or two of the districts holding works in both districts, our men who were thrown out were involved in the dispute, and the men said in the communication which they sent to us, "Now we cannot continue at work in this "work while the men working for the same firm in "another work in the other district are out, and "hence the men in North Staffordshire all agreed to "come out together." We supported them until our men refused to send money for their support, and stated that they had a right to be bound by the decision of the conference.

8560. Notwithstanding that at the meeting at Sheffield you had decided against the men in North Staffordshire striking, when they did strike you supported them?—The question of the men of North Staffordshire striking was not decided one way or the other; it was decided at the conference that they should accept the 10 per cent. reduction.

8561. And North Staffordshire was represented at that conference?—Yes.

8562. And at that conference you decided to accept the 10 per cent. reduction?—Yes.

8563. Afterwards a portion of the North Staffordshire men struck and resisted the 10 per cent., and you then supported them?—No. The whole of the North Staffordshire men, the men who were represented at this conference, as well as the men who were not there, struck, and having 400 members there we supported these men, carrying on a correspondence with our various lodges, and the lodges said ultimately "Now these men have a right to be governed by the resolution of the conference," and they refused to send money. I went down to North Staffordshire myself and advised the men to resume work, and they refused to do so.

8564. Still for a time money was sent to them?—For a time.

8565. (*Mr. Mathews.*) It was sent not only from the Middlesborough union but from the London trades unions, and a strong appeal was made to the Scotch union to support them also, was there not?—The Scotch union was a part of our own.

8566. A strong appeal was made to the Glasgow puddlers to support the North Staffordshire strike, notwithstanding that the conference had decided against them?—Yes.

8567. You were president at that time?—Yes.

8568. Was it under your advice that that was done?—We were anxious to work in concert with the Brierley Hill council. I do not wish to disguise or equivocate in the slightest degree. We would have supported the men in resisting the demand for a reduction in the event of its having been acceptable to our men.

8569. Notwithstanding all the other districts having accepted the reduction, the unions generally in London and elsewhere supported the North Staffordshire union in order to keep them out on strike against their masters?—Yes.

8570. (*Mr. Harrison.*) Did the Amalgamated Engineers support them in that?—My opinion is that Mr. Allen, the representative of that trade, was opposed to it.

8571. (*Earl of Lichfield.*) They got no assistance from the Amalgamated Engineers that you know of?—Not that I am aware of.

8572. (*Lord Elcho.*) As to the assistance that was promised to them by the meeting in London which led to their not accepting Lord Lichfield's arbitration, was that assistance forthcoming?—It was not forthcoming to the same extent.

8573. So that the promise which was made to them by a certain body in London, and which induced them to hold out, was not fulfilled?—It was not.

8574. (*Earl of Lichfield.*) What is your opinion as to the policy of that strike?—My opinion, after very mature consideration, is this, that it would have been much better if the acceptance of the reduction had been general, in consequence of the division of the trade and the large amount of money that was exhausted over the dispute which ultimately proved fruitless.

8575. It was a very protracted strike?—It was.

8576. About 16 weeks long, was it not?—I think about 22 or 23 weeks.

8577. The men I believe were greatly encouraged to hold out as long as they did by the prospects of assistance that were held out to them?—There is no doubt of it.

8578. And in that they were disappointed?—Yes, and working men are always disappointed when they depend upon the prospects held out by the passing of a resolution at a public meeting. As far as trade disputes are concerned the best security for working men is a large fund of their own; if they carry their funds in their own pocket they can defend themselves.

8579. (*Lord Elcho.*) Did any person go down to Staffordshire from the Working Men's Association of London on the occasion of that strike?—I am not aware whether there was a working men's association in existence then or not. I remember Mr. Straughan of Glasgow calling at our office at Gateshead. I met him at the station at 5 o'clock in the morning by the London express, and he received a written paper from us with the name of each member of the executive attached to it, which would fully empower him to carry out the principle of arbitration and endeavour to settle the dispute, and he went to Brierley Hill from our office. What agreement was come to there I am not prepared to say. As I could not say that what I might state is positively correct I would rather say nothing. But he went to North Staffordshire. Alexander McDonald was with him at the time, and I know that he complained to us very bitterly after he came back again of the obstacles thrown in the way of a settlement in consequence of the action taken by some of the parties who were moving amongst the working men of London.

8580. But you do not know whether any person went down from the working men of London to recommend on the spot that the arbitration should not be accepted?—I should not like to say positively that the working men went down, or did not go down; we had ceased then to take an active part in the matter, and with the exception of the case I have named when Mr. Straughan and Mr. McDonald went down, we had nothing to do with it. My impression is that a deputation did go down from London—whether a self appointed deputation or one appointed by some official body I am not prepared to say. I have heard that Mr. Potter went down, but whether he did or not I would not like to state positively.

8581. (*Mr. Mathews.*) There is no doubt of the fact; I believe that Mr. Potter did go down?—My own impression is that he went down, but I should not like to be positive about the matter.

8582. Have you ever considered, or made any sort of estimate what the cost of that strike was in North Staffordshire to the men on the one hand and the employers on the other?—I saw an estimate that was made a short time ago by Mr. Evans of Manchester.

8583. Do you agree with that statement of Mr. Evans's?—I should think it is pretty nearly correct.

8584. Do you recollect what it was?—I do not recollect the exact figures. I think it was reprinted in the "Joiner's Monthly Journal." I saw it there.

8585. I suppose you would admit that taking the fact of the puddlers in other districts having gone to work at a reduction, it would be impossible for the ironmasters in North Staffordshire to continue at the higher rate of wages?—It might be so in the event of their being compelled to pay 10 per cent. higher than in other districts, but the opinion expressed at that time and generally entertained I think by the men was, that in the event of the North Staffordshire men being kept out it might force up the wages again and force up the price of iron.

8586. Do you think that forcing up the rate of wages would necessarily cause a forcing up of the price of iron?—Most undoubtedly if it were done.

8587. Would it not result in the masters being compelled to stop their works?—It might do that, but it was not so at Brierley Hill.

8588. (*Chairman.*) Did the Brierley Hill men go on at 10 per cent. higher than their competitors?—No. The men were out in that district for something like 21 weeks, and it was ultimately arranged that the masters should raise the price of iron and give the men 1*s.* per ton advance.

8589. (*Mr. Mathews.*) But is it not the fact that the state of trade improved and the demand rose, and thereupon the masters consented to give them an advance?—There is no doubt that the price of iron was raised, and then the masters advanced the wages.

8590. (*Chairman.*) I have observed that you speak as if the iron manufacturers could command a price to rise when they pleased. You have no such idea in your mind, have you?—I know that if I were going to sell apples I could sell them at 6*d.* a dozen or at 1*s.*; that is to say, I could demand the higher price for them. I do not say that I could get it.

8591. (*Mr. Mathews.*) Would not your apples be apt to go rotten if you did not succeed in getting that higher price and would not sell them at a lower?—They must. There is no doubt that the demand has a great deal to do with the regulating of the price, but the employers frequently themselves, I think, force down the prices; if people cannot eat iron, and if the iron is not wanted, I do not see that it improves or increases the demand to reduce it lower.

Mr. J. Kane
20 Nov. 1867

8592. (*Sir D. Gooch.*) What interest can the master have in lowering the price of iron?—The securing of orders.

8593. That is his necessity, not inclination?—If he succeeds in getting a large order and then gets the men to work for a less wage he is placed in just as fortunate a position as if he were getting a higher price and the men working for higher wages.

8594. (*Mr. Mathews.*) Do you think that an iron master ever lowers the price unless he is obliged to do it owing to competition with others, or from some other cause?—I think that the competition embodies it all, they undersell one another.

8595. But they do not undersell unless they are obliged to do so, unless they cannot get the same price as their neighbours?—They do undersell at any rate.

8596. (*Lord Elcho.*) With reference to Belgium and the custom which you say prevails there, do you think that it would contribute to the prosperity of the iron trade in England if the puddlers were to combine farming with puddling?—I believe that the more the people go back to the land the richer the country will become, and the more surely the working classes be relieved from misery.

8597. Supposing that a puddler were likewise to farm, do you think that under such a system the iron trade would prosper more than it does now?—I can only say this, that I remember that at one period of my life I was working for four years and a half short time, and I had a garden at that time, and but for that garden my children must have starved.

8598. Then your farming was restricted to a garden?—Of course if you have not a large joint you must take a small one.

8599. (*Earl of Lichfield.*) There would not be much iron trade in the country, would there, if all the puddlers were to turn farmers?—I believe that if a puddler were to turn farmer there would be some difficulty in persuading him to go into the iron trade again.

The witness withdrew.

Mr. Daniel Guile examined.

Mr. D. Gui

8600. (*Mr. Mathews.*) Are you a moulder?—Yes.

8601. Where do you work?—I do not work at the trade now. I am the corresponding secretary of the Ironfounders' Society.

8602. You are the secretary of the Ironfounders' Society, residing in London, are not you?—I am residing in London.

8603. You are a paid secretary?—I am.

8604. May I ask the amount of your remuneration as secretary?—2*l.* 10*s.* per week and house rent.

8605. What is the number of members in your association?—11,106 was our last number.

8606. How far does it extend?—Over England, Ireland, and Wales.

8607. Throughout the United Kingdom?—Throughout the United Kingdom, save Scotland.

8608. What does each member subscribe weekly?—1*s.* per week with extra levies at times for accidents, emigration, and benevolent purposes.

8609. Depending upon the vote of the members from time to time?—Yes, depending upon the vote of the members from time to time as to special levies.

8610. What is the amount of your annual income?—The annual income from June 1865 to 1866 was 36,297*l.* 18*s.* 9½*d.*

8611. What is the balance of your fund now?—The last balance we had was 28,000*l.*; but then we have had a very heavy depression of trade of late, and I cannot give you what it is at present.

8612. That you have invested in various securities, I suppose?—No, we have it in bank monies.

8613. It is placed in the bank at interest?—Yes.

8614. Have you any written rules or regulations which you can put in?—Yes (*handing in the same*). It is a benefit and trade society combined.

8615. Then in addition to your ordinary trade regulations which, I suppose, are embodied in these publications, you have sick and benevolent funds?—Yes.

8616. Does the subscription to the union of 1*s.* a week embrace both the trade purposes and the benefit purposes?—Yes.

8617. According to the regulations which, I suppose, are embodied in this book before me, I suppose that in cases of disagreement about wages or strikes, or anything of that sort, the members all act together?—Generally speaking.

8618. So that if the council of the association comes to a resolution that there shall be a strike upon any occasion, all the members are bound to obey it?—Yes.

8619. And in the event of their not obeying it, is their investment in your benefit society forfeited?—Yes, under certain restrictions; there are some conditions. Supposing, for instance, that a man violates the general law, there is a penalty of so much to pay, and if he refuses to pay it in due and proper time he is expelled from the society for non-payment.

8620. And if the society comes to a resolution that a strike is necessary either for resisting a reduction of the rate of wages, or for an advance, every member is bound to submit?—That is left to the locality. The branch or locality in which the dispute takes place must first be satisfied that such a thing is required, whether it be a resistance of a reduction of wages, or seeking an advance of wages. After it has gone through the process of being submitted to a general committee of the branch, then it is sent to London, and the executive committee consider on the subject; all the facts are laid before them, and they weigh over

Mr. D. Guile.

20 Nov. 1867.

the question whether there are any chances of success about them, and they being free from the passions which exist in the locality itself are able to weigh the thing up impartially. Supposing, for example, that it is an attempt to reduce wages; if they see that there is a chance to resist successfully that reduction, then they pass a resolution that the men shall stand out and not submit to the reduction. Or supposing that they seek an advance of wages, and trade is in such a state that the executive think there is a prospect of success in asking the advance, then the executive say, "Yes, you may;" but when they see that there is no chance of success, they invariably say to them, "Well, "times are not of such a character as to enable us to "succeed in what you are seeking," whether it be either resisting a reduction or seeking an advance. Then the executive advise them not to do, and do all they can to hinder them from doing that which would not be successful.

8621. But in the event of a general concurrence they expect the whole of the members of the union to co-operate with them?—Yes.

8622. And if there are any members that do not co-operate with them they are excluded from the society?—Yes.

8623. And whatever they expected in the way of benefit is forfeited?—Yes.

8624. So that a man having paid 1*s.* a week for, say, 20 years, and having got a certain vested interest in the sick fund of your union may forfeit the benefits of the union by objecting to join in a strike?—Yes, by not acting under the dictum of the majority of the union.

8625. (*Chairman.*) A majority of one will do, I suppose?—Yes, but it never comes to a case—so close a case as that; it is a thing that is not probable at all. Supposing, for instance, that a request came up from Manchester, and there are 400 members, and 201 have said, "We will seek an advance," but 199 say "No, we will not," the fact would be laid before the executive and those men would carefully consider the thing and say to themselves, "Here are 199 men "who say the time is not ripe and proper to seek an "advance, therefore we will not agree to it."

8626. (*Mr. Mathews.*) So that you would not act upon a mere majority?—No.

8627. But in the event of your deciding in favour of the majority any person belonging to the society would be included in the majority, and would not be at liberty to act contrary to their decision?—No more than a barrister who took a less fee than the usual fee would be allowed to dine with the judges.

8628. In the case of an insurance society a man may sell his interest, but he could not sell his interest in yours?—No, and he knows it before he joins.

8629. In your association is there any regulation for the assimilation of wages irrespective of the degree of skill that is exescised by each moulder?—Well, it is always supposed that a man who has served seven years to a trade is deserving of a minimum figure of wage, below which it is derogatory to go. We have no maximum, but the wages fluctuate; for instance, in London they are 36*s.* or 38*s.*, in Manchester 34*s.* or 36*s.*, in Liverpool 32*s.* or 34*s.*, in Leeds 28*s.* or 30*s.*, in Bradford 30*s.* or 32*s.*, in Newcastle and the North from 26*s.* to 30*s.*, in Belfast and Dublin from 32*s.* to 34*s.* So that we do not equalise, or attempt to equalise wages throughout the country, simply for this bare reason, that it would be neither just nor expedient, as a man in London has to put up with a great many disadvantages which he has not to put up with in other localities; therefore, we consider that the men in the locality itself are the likeliest men to know the value of labour there.

8630. Take the case of two workmen having served seven years to the business, one is a clever and adroit moulder and the other a clumsy moulder, is the same rate of wages paid to both?—No. Take the shop that I last worked in. I worked 10 years there, and our wages varied from 32*s.* to two guineas, the minimum was 32*s.*, and we consider that a man must be a dolt indeed who cannot earn the minimum.

8631. But in case a master were to find a man who was a clumsy moulder and could not get to 32*s.* but could get to 25*s.*, would your society interfere to prevent his getting 25*s.*?—They would do their best to prevent it.

8632. That is one of the objects of your society; you place a limit on the minimum?—Yes.

8633. But no limit on the maximum?—No.

8634. So that if an employer had some workers who were very adroit, very accomplished, and perfect in the capacity of moulders, and if he were inclined to give them a higher rate of wages, but would be obliged to recoup himself by paying inferior men a lower rate, he might not do that?—Not if it were below the minimum.

8635. (*Chairman.*) Take a man above 50 years of age who could not get 32*s.* but could get 25*s.*, has he to go to the union?—No, he is allowed to take 25*s.*; neither a man above 50 nor a man under 22 is prevented from taking less than the minimum.

8636. (*Mr. Mathews.*) Because in the case of the man above 50 he is too old, and in the case of the man under 22 he is learning his trade?—That is our view of it.

8637. (*Chairman.*) Supposing that a man has his arms impeded by rheumatism, what then?—He could go on the sick fund.

8638. And do nothing?—And do nothing.

8639. (*Mr. Mathews.*) Have you had any strikes lately in your department of industry?—We have had no strikes of any consequence; we have had resistance to reduction of wages consequent upon bad trade. Employers have taken upon themselves (and I suppose justly and rightly too, according to their own opinion) to say, "We cannot afford to pay such a figure;" and the men have said, "We cannot afford to work for less."

8640. What is the state of the trade now?—Very bad indeed.

8641. Do the masters contemplate any reduction in consequence of the state of trade?—In some places, not generally.

8642. No general notice has been given on the part of the masters?—They never act in concert.

8643. Each town or district acts according to the state of its own demand?—Yes.

8644. Your experience of these strikes, perhaps, is limited because they have not been numerous in your time?—Yes, in a period of 40 years they have.

8645. You have had many strikes during that time?—Yes, a good many.

8646. What has been the general result of those strikes, and have they been of long duration?—A negative good. Some of them have been of long duration, but invariably they have turned out well.

8647. You think that the general result has been to raise the average rate of wages above the other trades?—We have not sought so much the realizing of an advance as the maintaining of our position.

8648. Then the strikes on the part of the moulders have not been for an advance of wages, but to resist a reduction?—The heaviest strikes that I have known have been to resist an attempt on the part of the employers to break up our union.

8649. Has that attempt been made by reducing wages or by a refusal to employ men?—A refusal to employ men who were club men, unless they would sign a document stating that they would no longer be members of the society.

8650. Do you know the number of moulders in your district out of the union in proportion to those in the union?—Ten in the union to two out.

8651. So that the bulk of the moulders are in the union?—Yes, in that locality; but there are many localities, such as South Wales and Cornwall, in which a society is not in existence. A society man could hardly live in South Wales.

8652. Taking the whole kingdom do you think that that proportion would apply?—Hardly that.

8653. Would there be more in union or less in union?—There would be less than eight-tenths, taking the whole kingdom, and including Cornwall and those parts.

8654. (*Lord Elcho.*) Do you know how many iron moulders there are in the United Kingdom?—No.

8655. (*Mr. Mathews.*) You said that a union in Wales would not sustain itself, why?—Because the men have not been taught unity. There is a self-reliant spirit there, which has brought them to premature old age and want, and they are kept down in such a style as English unionists would not submit to.

8656. The rate of wages is lower then in Wales than in other districts?—In South Wales.

8657. (*Mr. Merivale.*) You say that trade is against you, how long has that been the case?— Twelve months, it has been going down 18 months.

8658. You have had a long experience in the trade, on the whole have the times been more in your favour than against you?—I should say more in our favour.

8659. Do you find that the action of the unions is strongest in a favourable time or in an unfavourable time, when do men hold together more?—In good times.

8660. Are strikes more numerous in good times or in bad times in your business?—Well, they are not numerous, they are mere casual things, they are not the general rule.

8661. But do these casualties happen more when trade is thriving or when it is in a bad way?—Hitherto and of late years it has been more when trade has been bad, because having a fixed wage men are inclined to think, "If we give way we shall not get it up again;" and I lament to say that that is a fact. There was a remark made here that reducing the wages does not increase the labour. But the employers have often said, "Now trade is very bad, we "shall certainly have to pull down the wages, but "when the state of trade admits of it you shall have "higher wages again." And the men have said, "Well, half a loaf is better than none," and they have been inclined for that reason to give way. But when trade has revived and the men have gone into the office and asked for the promise to be realized, they have been told, "We can get plenty of men for what you are working for, and if you do not like it you can go." That has been one cause of strikes, combined with the efforts to break up the unions.

8662. The strikes have been more against lowering wages than in favour of raising wages?—Yes. When men want an advance in wages the system adopted by the society is generally to say, "We cannot make a "strike for the sake of your getting higher wages. "Supposing that you are not satisfied with your pre-"sent wages, we will allow you the benefits of the "society, but the shop must remain open for anyone "to go in and work so long as he will work within "the minimum figure of the branch."

8663. (*Mr. Harrison.*) Did you say that the general effect of the union had been to keep the wages rather steady than constantly fluctuating up and down?—That is my opinion, and I feel confident of that, and I will tell you why. We are not a mere mushroom society, we have had 50 years' experience now, and we find that employers have invariably said to the men, "Take a fortnight's notice," and they have invariably accompanied that with, "I will wait till the decision of the executive committee," seeing that the executive committee are men sitting at a distance and who are divested of that passion which exists in the locality itself, and if the masters feel convinced that there is going to be a strike, in many instances I have known them to withdraw the attempted reduction or their resistance to an advance of wages in good times.

8664. You said, I think, that strikes were more prevalent when times were good, and the men got an advance of wages?—No; I said when times were bad, and I tried to show the difference. If any strike takes place for a rise of wages, and the society do not countenance the strike, then they say, "We cannot close the shop," but the reverse is the case when trade is depressed and a reduction is proposed; the society says, "We will resist this, and no man shall go into the work if we can keep him from doing so."

8665. What weekly allowance do you make?—10*s.* for a single man, 2*s.* for a wife, and 1*s.* for each child under 12 years of age.

8666. As long as the strike lasts?—No, we consider that the neck of a strike is broken in six weeks, and that if we cannot win it in six weeks we must give in.

8667. What is the longest duration of a strike that you have known?—I can hardly answer that definitively. A strike say has taken place; the employers and men go on very warmly for six or eight weeks, but both feeling that they are losing; by that time they both cool down, and by the time three months are gone over the master begins to lose his strictness about a society man coming to work under him, and very often he is willingly blind to the thing, and allows society men to go on entering his works, and very often before the master is aware of the fact all the men are society men.

8668. (*Mr. Mathews.*) Is there any indisposition on the part of your society for the men in the union to work with men not in the union?—They would rather not do it than do it.

8669. Is there any coercion put upon non-society men who are in the same shop with union men?—It depends upon the character of the men. If a man has become a non-society man by fraud or anything low, or by trickery, another workman looks down upon him with the same contempt that one gentleman looks upon another who has swindled anyone.

8670. In the event of three-fourths of the men in a shop being union men, and the other fourth being non-union men, is there any attempt on the part of the union men to make the situation of the non-union workmen so unpleasant that they must leave the shop?—No, I do not know that there is; there are all means of persuasion used to induce them to come in, and if they do not come in, it is not so comfortable for them as if they do.

8671. If a master engaged a non-union man in a shop where they were all union men, would the union men say to the master, "The union men will not work for you unless you discharge that man?"—It would depend upon the circumstances. Supposing that 19 society men were working in a shop and a non-society man was brought who would do all he could to uproot the society, the 19 would walk in to the master and say, "Now, sir, we cannot stay with this man; if he stays we go."

8672. And if he did not choose to discharge him they would strike?—They would walk out.

8673. They would say to the master, "If you "persist in employing a man not palatable to us we "will not work with him?"—Yes; but in many cases if they did it would not close the shop. There is a good deal of difference between a man giving notice to leave his employer, and then taking the usual benefits of the society, and a strike. Where a man is at liberty to leave his employ he leaves it free for any other man to take his place who sees fit to do so, but where it is a strike we close the shop.

8674. (*Sir D. Gooch.*) You say, "We close the shop;" but supposing that the master does not close the shop?—I mean that we close the shop as far as we are concerned.

8675. In one case your men come out and do not work. I do not see what you do in the case of a strike?—Word is sent to the executive sometimes that there are certain grievances in a branch. The executive weigh up the case and say perhaps, "It is not such a grievance as we can afford to have a strike over;" they say, "You are perfectly entitled to leave the "shop, and to have the benefits which members "are entitled to, and then any other clubman can go "into it if he likes." But if it is a grievance that the society think they can fairly combat, they simply say, "You may leave." It is not the executive who say "You must leave," but it is generally at the

Mr. D. Guile.
20 Nov. 1867.

request of the men employed; we never dictate to them.

8676. (*Mr. Mathews.*) You put it to them to exercise their own opinion? — We are generally arbitrators, if one may use the term.

8677. In striking a shop, do you picket that shop? —No we do not picket it at all; our men may possibly of their own will and accord do so, but we have no system of the kind. I would myself, if I saw a moulder on the road, ask him, "Are you going to seek a job up there?" and if he said "Yes," I would say, "You are a great fool if you go, because all the men are out and you will be doing an injury to yourself."

8678. You do not countenance picketing in your association?—No.

8679. (*Sir D. Gooch.*) How does it do the man himself an injury to go to work at the place?—In this light; present evils not only relate to the present but also to the future. I for instance may leave a shop because the master has been wanting to pull down my wages to such a figure that a man with a family of eight or nine children cannot possibly live at it, but here is a young man who comes down to the place and he can live comfortably perhaps on that amount at the present time, but there is a day coming, perhaps, when he will be the father of eight or nine children, and then it would not be a comfortable provision for him; he is only wetting the blanket to lie on himself; that is how he would be doing himself an evil.

8680. (*Lord Elcho.*) But supposing that he is not a member of your union and is in want of employment and bread?—I would persuade him to become a member, and give him a piece of bread if he wanted it.

8681. (*Mr. Mathews.*) In the event of a strike you use no active measures to prevent men disposed to work in a shop from working in it, but you use all the means you can to keep them out?—We use all moral means.

8682. You use all the social influence within the law that is in your power?—Yes. Here is a fact in point which will give some idea of what our disputes have been during the last eight years. The cash paid for strikes has been, during the period of the last eight years, a total of 1,877*l.* 9*s.* 6*d.*, or less than 8½*d.* per member per year, while at the same time there has been paid for benevolent purposes on the average by each member 2*l.* 13*s.* 2¼*d.*; that amount has been spent per member per year for the support of our benevolent fund—not for strikes, but for sickness, old age allowance, and so on; that is very nearly 75 per cent. of the whole.

8683. (*Sir D. Gooch.*) You said, as I understood you, that the question which determined you in your demand was what you could get; do you mean that you would put it as a question of what you can get rather than as a question of what is right and good for the masters as well as the men?—We put it as a question of expediency.

8684. You seemed to put it as a question of your being able to get it, that if you could get it you would try for it, irrespective of the employer's interest in the matter?—Well, long experience has taught us that it is folly to go into a strike where there is no chance of success, and long experience has taught us that it is to our advantage to gain anything out of capital that we can when there is a chance.

8685. You might succeed but succeed unjustly, might you not?—I do not think that we can succeed unjustly.

8686. Why not?—For this reason, that I see employers who during my day were journeymen, they were journeymen 21 years ago, and they have been living on their losses and riding in their carriages up to the present time, while the best geniuses and the most intelligent amongst the men have to be well contented if they are able to get a new coat once a year.

8687. Is it your opinion that it is desirable to let a journeyman have the means of getting into a position in which he may keep his own carriage, by giving him wages according to his merits; that is to say, by piece work?—I would say that the man of merit should go into the carriage certainly.

8688. Is it your opinion that the trade ought to encourage a principle which would enable a man of great merit and industry to succeed in life, and that he should have the opportunity of benefiting himself and his family by that success; or do you hold, as we have heard it stated here, that such a man is a selfish man who should not be allowed to rise, because by his rising he does an injury to his fellow man?—I would say that if he is doing an injury to his fellow man his raising himself is a curse rather than a blessing. But if by merit, by industry, by talent, and by energy, he can raise himself without injuring his fellow man, I would wish him God speed.

8689. Do you believe that a man in raising himself would injure his fellows?—I believe that he has done so in some instances. The man is given piece work, he is made a kind of middle man—a sort of whipper-in, and he has to drive, it may be, a better man than ever stood in his shoes, and he gets cent. per cent. out of him.

8690. Have you much piece work?—We have in some instances; we have hardly done with it yet; some men have earned 14*l.* or 15*l.* a week, it may be, and some others who are made to sweat drops of blood hardly earn 32*s.* a week.

8691. Have you any byelaws similar to those of the Amalgamated Engineers, by which a man working on piece work, and who is the leader of the work and has another man working with him, is bound to share with the man who helps him the profits of the earnings of the piece work above ordinary day work?—No.

8692. (*Mr. Mathews.*) Take the case of a man who is sober, industrious, sagacious, intellectually above his fellow men, ingenious above his fellow men, and who is competent as he thinks to take certain departments and pay men under him, is there anything in your association to prevent a man putting himself in that position and taking work from the employer by the ton?—No direct rule.

8693. But you discourage it?—Yes.

8694. You discourage a man having capacities for raising himself from putting himself in a position to do it?—If it is done at the expense of his fellows, because whenever such a man is put in it is harder to work for such a man than it is to work for a *bonâ fide* employer. I would prefer to work for a gentleman who is to realize a certain profit out of me than for a man who is to step in between me and the gentleman. West Indian slavery cannot be worse than in some cases that is, and hence we discourage it.

8695. Are you prepared to admit that the bulk of the men who raise themselves above their fellow men raise themselves by virtue of the good qualities which I have mentioned?—Yes, perhaps so.

8696. Take the case of railway chairs; a man sees his way to manipulate railway chairs in a better way than hitherto, and he says to his master, "I can see "my way to that being done at a lower rate than "hitherto," you would discourage that?—No, I would not; but if he made an under man under him work harder than a slave to achieve his purpose, then I would discourage it.

8697. Supposing that the under man refuses to work harder than a slave, and says, "I will only work "for you on the same terms as for my original "master," would you discourage it then?—Where we can we discourage.

8698. (*Lord Elcho.*) What power would this middle man you are alluding to have of making a man working under him work harder than before?—The only power of hindering him from getting bread.

8699. His master could do the same?—But his master would not do it—the master is contented with the profit that the man brings him, but here this middle man steps in between them to get an extra profit.

8700. (*Mr. Harrison.*) You are speaking now of a system of working by middle men; but taking piece

work in the ordinary acceptation of the term, that is, a man being employed to do work not at a certain rate of wages per day but at a price per ton, for instance, what is the practice of your union with reference to that?—We have such a practice, but we find it an evil one. As a case in point I recollect when 40 chairs were a day's work, and they kept encroaching and encroaching by piece work until it got to 120 a day.

8701. You mean that if there is an habitual practice of piece work the wages of the men are not on the average raised by it?—They are not, because they have to put into it more physical labour, more skill, more dodging, more scheming, and to work more hours for it.

8702. Can you say positively yes or no to this question? As a matter of fact, has the union by its rules as to piece work, or by any other rule or practice which is adopted in it, prevented men of industry and ability from rising in their trade, and making the most of their skill?—No, it has not.

8703. Do you know personally cases where men have actually succeeded in doing so?—Yes.

8704. How do you explain it then to be possible for a man to make the most of his skill if such a system of piece work is prohibited?—Simply from what we hear of employers telling us almost daily that they will give any amount of money to men of merit and men of intelligence and sobriety. All I say is, do so, but do not do it out of me.

8705. Then there is nothing really to prevent a man of very superior skill or strength or industry from earning more than his fellows?—No. You need not go out of London to find that. Taking Maudesley's and Penn's, for instance, you will find that the wages are ranging there from 38*s.* up to 2*l.* 10*s.*

8706. Does the union by direct or indirect means prevent that variation of scale according to merit and ability?—No.

8707. Does it encourage it?—Yes.

8708. The experience of your society, I believe, and possibly your own personal experience, goes back to the time when your union was in existence under the old system before the repeal of the combination laws, before 1825?—Not my own experience, I entered in 1834.

8709. But the records of your society go back further?—The records of the society go back to February 1809.

8710. Can you describe what you have gathered from the records of the society, or from what you have learnt as a member of the society, of the condition of things under that old system?—No, I could not give you anything definite.

8711. The society was secret, I presume?—So secret that we had to dig holes in the floor and hide our books there, and meet out on the open moor.

8712. Was the society, notwithstanding that, enabled to carry on its operations?—Yes.

8713. Did it receive contributions, and conduct strikes and the rest just as if it were legalized?—Yes.

8714. Were those of a less lawful character than those which you have been describing as happening in your own time?—I daresay there would be a little more physical force exercised, but I attribute that to a great extent to the education of the people. If a man in those days had done anything unpleasant to his companions, and was crossing a bridge over a river, they would very likely give him a lift over and a cold bath; but that was under the law of smuggling and piracy.

8715. You mean that the general organization of unions has been much superior of late times to what it used to be in early times?—Yes, very much.

8716. Very much more conforming to law, and with fewer cases of outrage?—Yes; all the outrages I have ever heard of in connexion with our trade have been cases of men who have met in a public house and had some dispute there.

8717. Have any cases been brought before your central executive where a local officer of the society or any member of the union in any part of the country has been charged with or suspected of outrage?—There was a case at Hull; I think, however, it was a mere nothing; it proved itself a myth.

8718. How long ago was that?—Some three or four months ago. There had been a bit of disturbance in the shop, and somebody had got in on the Sunday and had thrown rammers and spades into the water that runs alongside the shop and had spoiled some moulds.

8719. Is the practice of rattening, then, or destruction of the property of workmen altogether unknown in your trade?—I never knew it.

8720. You never had a case of it?—We never had a case, and I should be very sorry to have one.

8721. Will you positively state that no member of your union has been convicted of such a thing?—Never to my knowledge.

8722. I mean destroying the property or the tools of fellow-workmen who are not members of the union, and things of that kind?—Never to my knowledge. I do not recollect anything bordering on such a case.

8723. Have the executive ever felt it necessary to take measures or to give instructions for the purpose of discontinuing things of that kind?—No.

8724. But you have no doubt that it would do so if necessary?—Most undoubtedly it would do so. I may tell you that our monthly report goes to show the men that labour has its duties to perform as well as its rights to expect. If there was anything like rattening, or anything of the sort, it would have to appear in this book (*pointing to a book*). In this is given every halfpenny paid by the society by every member, and every member's name who has paid it; and every halfpenny that has been paid out, and every man who has received it; and the miscellaneous items, I may safely say, do not amount to 2½*d.* in any branch in England. So that if there was anything like a rattening system countenanced by the societies, it would come out in this book.

8725. You are prepared to state that during the time that you have been a member of the society you have never been present at any meeting of the union at which a scheme for rattening has been countenanced or directed?—Never.

8726. Or anything approaching it?—Nothing in the shape of it. The society generally, even the roughest of us, would look upon any man who dared to get up at a public meeting and propose rattening as the greatest enemy we had, a greater enemy than the masters who come into conflict with us in a strike.

8727. With regard to the employment of apprentices, or the apprentice system, does the union adopt any general policy, or is it left to the separate branches of the society to deal with it, or is it perfectly open?—There is no definite law on that subject, it is merely a practice of the locality more than anything else; but it is considered, if there is any law at all, that one boy is sufficient to three men. We are never stringent and men are seldom fined, but we do all we can to keep it to that.

8728. Have you had any strike of late years arising on that question?—No, none of consequence.

8729. (*Mr. Mathews.*) Supposing that the proportion of apprentices should be one to every three men, and any one of the men should choose to take more, the society would discourage it?—Yes.

8730. If he were to persevere in it would they expel him?—No. In certain localities each man has a boy. For instance, at Worcester, and at any places where there is a good deal of stove work and pot work, they generally have a boy with them.

8731. You do not limit it to one to three?—We do our best to keep it that.

8732. So that if an employer wished to increase the number of apprentices it would be discouraged on the part of the men?—Yes.

8733. If they were to persevere would there be a strike?—I cannot say.

Mr. D. Guile.
20 Nov. 1867.

8734. It would be a matter for discussion with the executive?—Yes.

8735. About this question of middle men, you place no limit to the maximum rate of wages, but only to the minimum rate of wages?—Yes.

8736. In the case of a man such as I have alluded to, being a man of comprehensive views, and more sagacity than his fellows, who can turn out work better and cheaper as a middle man than he could by doing work directly for the principal, you would discourage such a man?—No, I do not say that. The worst of it is, that these men who get that name are generally bad men.

8737. You assume that they are bad men?—Yes, because they have not merit more than other men, they have not talent more than other men, nor have they ingenuity more than other men; but they have more effrontery in them. Hence they push themselves into the positions; and under such circumstances, supposing we saw that the man was of such a character, we would do our best to show the employer that it was wrong; and supposing that it came to the dernier resort of a strike, we might win or not, but by and by the thing would drop into its usual groove and we would find the man going on until he would whip and goad his men to such an extent that a strike would be the ultimate result.

8738. Are we to infer that the majority of the men who have obtained that position are men of the character you have described?—I am rather in dangerous company to assert that. I do not mean to say that all are so. There are exceptions, and I thank God there are.

8739. Is it not the case that elevation above your fellow men and advance in your social condition is generally attributable to superior sense and superior talent?—Yes.

8740. In such a case would your society set its face against that?—No, but where the devilry would set in and where the tyranny would set in, there the society would set its face against it.

8741. But would it not be as easy to prevent such a man from doing injustice as to prevent a master?—It is hard to beat such a man; he knows where all the scum of the country is, and he can fetch them to his aid.

8742. You discourage piece work on the assumption that it leads to that evil?—Yes, where men aggrandize themselves, and allow no one to enjoy the benefit. I could quote instances, places in this country where piece work has existed and where men have realized as much from the head of a firm as should have kept at least four or five men and their families in comfort; and I may say that the results of that have been that the very self-same men when the firm has failed have been obliged to go to the gaol for not paying their debts.

8743. (*Sir D. Gooch.*) Would not that evil be cured by the rule that the Amalgamated Engineers have of some division of the profits of the piece work?—It might. I do not know whether the Amalgamated Engineers have cured the evil or not; if they have, they will tell me so, for we are very good friends.

8744. That would get rid of your difficulty?—We do not find great difficulty in it; it does not often happen.

8745. (*Mr. Harrison.*) But speaking generally, how would you sum up the advantages which you think the existence of the union in its present form gives to the trade?—In the first place, if rightly and properly carried out, it enables all masters to go into the market upon the same terms. For instance, here is a master, who is a young beginner. He has, perhaps, a pretty large capital at his command, but as a young beginner he has no connexion. He is resolved that he is going to make his works pay at whatever hazard. Now the question was asked this morning, What are men to do when prices fall so low? I will only urge that if the employers of this country exercised the same amount of skill and ingenuity, namely, to keep the price of manufactured goods up as they do to keep down the price of labour, the prices in the market would not fall so low. One good effect of a union is that every employer shall pay the same price for his labour. There is a young beginner who wants to form a connexion, and he sees that there is no way to form a connexion except by undercutting the others; and the issue of that is that he has to undercut his men because he will not allow the certain margin left for profit to be touched, so that if a reduction takes place in the manufactured article it does not come off his profit, but off those who are employed. Now if all men were society men, and asked a fair day's wage for a fair day's work, and all masters were willing to abide by that rule, then all the masters could go into the market on the same footing; not only that, but the union encourages a man to become a proficient in his trade. He knows that if he would be a respected member of society he must be at least above the common rank, and it gives him a stimulus; and another thing is, that it enables the working man, who is looking on with some degree of anxiety 40 or 50 years, to see that there will be something at the end of that time to rely on; superannuation money, sick money, accident money, and all those things are in his favour, and make him a provident man. And most of the men that I know who are non-society men in a locality where a society exists are drunkards, idlers, and very often improvident men, that do not care for their wives, or children, or themselves, and I lament to say that very often they are defrauders.

8746. (*Mr. Mathews.*) Does not that apply equally to society men and non-society men?—No, I do not think so. I gather my information from masters with whom I have been brought into contact, and it has invariably been their evidence, "I would rather "employ club men because they are more intelligent "men."

8747. Do you confine yourself to your own society or do you include other societies in that answer?—I can speak better to my own society.

8748. (*Earl of Lichfield.*) I understand you to say that where there is a society the best men will join it?—Yes.

8749. (*Mr. Mathews.*) Have you many members in South Staffordshire?—Yes, we have members in Bilston, Dudley, Hanley, Stourbridge, and Walsall; those are our principal places in Staffordshire.

8750. Can you give the number collectively in that particular locality?—No.

8751. (*Sir D. Gooch.*) Do any brass moulders in Birmingham form any part of your society?—No.

8752. Do the brass moulders generally belong to your society?—No.

8753. (*Mr. Mathews.*) They have a union of their own?—Yes, there is just one observation more which I would like to make, and I expected that Mr. Kane would have said it. It is in reference to a question which you asked, to this effect, whether if iron costs 5*l.* 10*s.* a ton for the labour, and there is a drop of 1*l.* in the price, the ironworks must close unless the wages are reduced. Now that brings us to a very serious point of consideration. If the ironworkers, ourselves included, are now as low as we can possibly get (and 24*s.*, if that evidence be true, is low enough), is it desirable that we, the British manufacturers and artizans, should come down to the level of the continental nations? I believe that nothing but England's well-paid artizans maintained our position as a nation during the great struggle and crisis of revolutions on the continent. And you will recollect further that at the time when the great Chartist agitation was going on in this country their cry was, "Only pull down the "artizan class of this country to the level of the "labourer, and the Charter would have to be "granted." My opinion is that if we are to be brought down to the level of the continental workmen, who can live on a drop of sour wine and half a handful of raisins, our position will be the same as theirs, and we shall be as near revolution as they have been.

Mr. D. Guile.
20 Nov. 1867.

8754 (*Lord Elcho.*) What would your remedy be?—I hardly like to state my remedy, but I believe that the law of primogeniture will have to be knocked on the head for one remedy. I believe that God gave the land to the people, and did not intend that one man should have a hundred miles of it.

8755. (*Mr. Mathews.*) Is there any law of primogeniture?—They tell me so; I am not a lawyer. These, however, are very serious things.

8756. (*Sir D. Gooch.*) I suppose you admit that prices are influenced by buyers as well as sellers?—Yes; I do not think that a reduction of wages will always augment the demand. As I have said before, employers generally have sprung from us, and they have gone up at such a rapid rate that in 24 or 25 years they actually do not know you when they meet you, though you may be as intelligent as Lord John Russell. They are always talking about their losing so much, and yet they thrive by their losses; and if the employers would be content with a less margin of profit on their capital you may depend upon it that they could afford to give better wages to the workmen.

8756. Is it not one of the greatest advantages of this country, as contrasted with foreign nations, that the highest positions of society are open to every one who has merit?—I daresay it is; I would rather be an Englishman than a Frenchman. I am somewhat like the man who said, "England, with all thy faults, I love thee still."

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

1, Park Prospect, Westminster, Thursday, 21st November 1867.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.	JAMES BOOTH, Esq., C.B.
The Right Hon. the EARL of LICHFIELD.	JOHN ARTHUR ROEBUCK, Esq., M.P.
Lord ELCHO, M.P.	THOMAS HUGHES, Esq., M.P.
Sir DANIEL GOOCH, Bart., M.P.	FREDERIC HARRISON, Esq.
HERMAN MERIVALE, Esq., C.B.	WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. WILLIAM HOBSON examined.

Mr. W. Hobson.
21 Nov. 1867.

8757. (*Chairman.*) You are the secretary, I believe, of the Associated Ironworkers of Great Britain?—Yes.

8758. Having its head-quarters at Brierley Hill?—Yes.

8759. That is one association I believe; Mr. Kane representing another association, of which the chief office is now at Walsall?—Yes.

8760. I think we examined Mr. Kane a good deal with respect to a strike of the Staffordshire ironworkers; were you acquainted with the circumstances of that strike?—Some of them.

8761. And the approximation to a settlement by arbitration?—No, we were not connected with anything in the way of arbitration; our association were not consulted upon that question.

8762. (*Earl of Lichfield.*) First of all will you have the kindness to tell me what are the relations between your association and Mr. Kane's association; in what way are they connected, because if I understood Mr. Kane correctly yesterday, he said that you took part in the conference that was held at Sheffield?—Yes, we did. There was a confederation of the two unions that took place during the Leeds affair; we were to assist each other both morally and pecuniarily during the continuation of the strike, or rather of the lock-out. Prior to the Sheffield conference they severed their connexion by a resolution which was passed.

8763. That was before the lock-out, I understand you?—Yes, we were confederated during the lock-out.

8764. Were you present at that conference at Sheffield?—Yes.

8765. And what was the resolution arrived at there with regard to the state of things in Staffordshire?—There was no resolution in regard to Staffordshire. There was a resolution passed in regard to the North union and Scotland, to the effect that they were to endeavour to get the employers to meet them half way, if not, to accept the whole reduction.

8766. Is this magazine that has just been put into my hands, the "Ironworkers' Magazine," in connexion with your association?—Yes, it is the first that was issued after its organization.

8767. Do you refer, in this magazine, to the meeting at Sheffield?—Those conditions stated therein are the confederation conditions that took place during the Leeds lock-out, between Gateshead and Brierley Hill.

8768. Then, in point of fact, at the time of the Sheffield conference you were acting in concert with the association represented by Mr. Kane?—We merely went down to the conference to understand what resolutions they came to, in order that we might return and lay them before our members.

8769. Then after that conference at Sheffield you had a meeting of your own association at Brierley Hill?—Yes.

8770. Have you got any report of that meeting that you could furnish us with?—Yes, I have the minute book here, with the resolutions inserted.

8771. What was the result of that?—The meeting was called together in order to consider whether it would be politic to accept the whole reduction or not, and 15 of the districts came to the decision that it would be policy to endeavour to meet the employers if possible, or rather to get them to meet the men half way. Another meeting was convened a week after (at the termination of the notice for the reduction), and at that meeting it was decided for the North Staffordshire men, at their request, to endeavour to get the employers to meet them half way, if not, to resist the reduction; and the reason that they came to that decision was in consequence of the statements given in by the North Staffordshire delegate. He stated that the men at the different works in North Staffordshire had waited upon their employers, and that most of the employers stated that they were willing to meet them half way providing the others were, and the delegates were under the impression that if the matter was tested, the employers would probably give way, or concede to their request.

8772. Then the North Staffordshire men at that meeting expressed their intention of refusing the reduction that had been offered by the masters?—Yes; in fact the delegate went so far at to state that he dare not return unless the decision was in favour of resisting.

Mr. W. Hobson.

21 Nov. 1867.

8773. What was the feeling of the South Staffordshire men at that meeting?—They were in favour of accepting the reduction, the whole of them. There is a report of the North Staffordshire affair inserted in the next annual report, 1865, which is the representatives own explanation of the affair.

8774. I think that part of the men in North Staffordshire belonged to your association, and part of them belonged to the association represented by Mr. Kane?—Yes.

8775. How was it that the men belonging to your association and the men belonging to the association represented by Mr. Kane both struck, when Mr. Kane's association decided against a strike?—It was a compact entered into between themselves in the North Staffordshire district.

8776. But they would not have come to the decision, I suppose, to strike unless they had been promised some support; was that support promised by you or by Mr. Kane's association?—There was not any support at all promised then. At the termination of the notice for the lock-out there was a resolution passed that they were to accept the reduction, and they were respectfully requested to return to their work. There was support rendered them for seven weeks from our association prior to the lock-out.

8777. You undertook to support them for seven weeks?—Yes.

8778. But did you undertake to support all the men, or only those belonging to your own association?—We only undertook to support those belonging to our association till the men in North Staffordshire made an appeal to our council to ask that in the event of the North union refusing support their members might receive a share of the support which they were receiving.

8779. Then you supported your own men, and the men belonging to the Gateshead association had nothing to depend upon while on strike. They had no promise of support from anyone according to that?—They received support from the North union.

8780. From the Gateshead association?—Yes; but after the North refused to support them our members in North Staffordshire shared the amount of aliment they were receiving with them. I think it came to about 3*s.* 4*d.* per week; 10*s.* was allowed to the men under the Brierley Hill superintendence, and they allowed the men under the superintendence of the North an equal share.

8781. How long did your association continue to support the men in North Staffordshire?—Seven weeks.

8782. How long did the strike last?—17 weeks on the whole; that was the whole time they were out.

8783. And the men only received support from your association for seven weeks?—Only seven weeks. There were some of them victimized, and a delegate meeting met on May the 6th, and decided for them to receive victims aliment. I mean those that the employers would not employ again.

8784. What allowance was made to them by your association?—After they were victimized they received 1*l.* a week for three months.

8785. During the seven weeks I mean?—3*l.* 10*s.* for the whole seven weeks; 10*s.* per week per member.

8786. How many members had you in North Staffordshire at this time belonging to your association?—350 bonâ fide members.

8787. How many men were you supporting at that time?—350.

8788. (*Mr. Harrison.*) On what you call the victim fund?—No, during the seven weeks.

8789. But how many on that victim fund?—I cannot exactly say.

8790. (*Earl of Lichfield.*) Will you explain upon what grounds your association decided upon supporting the resistance of the North Staffordshire men to the reduction when they accepted it themselves in the South?—They were under the impression that the employers would give way in consequence of Mr. Bates and a few others stating that they were willing to concede the one half to the men, while there were some of the other employers who stated that another shilling ought to be taken off, that in fact they were receiving a shilling more than they really ought to do, and the members were under the impression that the employers in North Staffordshire would allow the men to commence working at only 6*d.* per ton reduction, and the resolution went to say that it was to test the masters in North Staffordshire whether they would give way or not.

8791. How could you suppose that the masters in North Staffordshire would be able to give 10 per cent. more wages than the masters in South Staffordshire?—The men in North Staffordshire assigned the reason of their being put to several inconveniences, such as leaving South Staffordshire and having to pay more rent. That was the reason that they assigned at the meeting, and they considered that the reduction was uncalled for.

8792. They assigned at that meeting special reasons for thinking that their wages should be higher than the wages in South Staffordshire?—Yes.

8793. And it was upon that that you decided to support the strike in North Staffordshire?—Yes, it was upon that that the delegates decided to support the men in North Staffordshire. You will please to bear in mind that there were 21 districts who took part in this decision, and some of those districts comprised 20 works, and a representative from each district was at the meeting. It was not the executive council at Brierley Hill that decided, but a special meeting from the whole association.

8794. What districts were represented in your association?—At that time there were Brierley Hill, Wednesbury, West Bromwich, Tividale, Tipton, Manchester, Smethwick, Moxley, New Birchills, Liverpool, Derby, Warrington, Pelsal, and other places.

8795. What other counties besides Staffordshire were represented in your association?—We have a work at Gateshead, and we have works at Manchester, in North Staffordshire, Wednesbury, West Bromwich, Pelsal, and so on.

8796. Do I rightly understand you that you only supported the strike in North Staffordshire for seven weeks out of the funds of your association?—Seven weeks prior to the lock-out. There was a delegate meeting called after the lock-out in order to take them upon the funds again in consequence of Mr. Bates refusing to employ the mill-men again; that was when they came on to the fund again. He wanted to compel the mill-men to leave the puddlers' association.

8797. Do you know how they were supported after the end of the seven weeks?—They were supported by public subscriptions after the end of the seven weeks.

8798. Then after the end of the seven weeks they were not supported by your association until after they were made victims, as you say?—They issued a printed appeal to the public, and they were supported, so far as they did receive support, by the public alone. They received no support at all from our association until the dispute was being brought to a close, and the employers wanted to persuade the mill-men to give up membership; or rather, they stated that a deputation waited upon Mr. Bates at Tunstall, and he stated that if the mill-men did not give up their membership to the puddlers' union they would not be employed any more. Our association had given a pledge to the honorary secretary of the Iron Masters Association not to support directly or indirectly the North Staffordshire men prior to the lock-out.

8799. Do you know where the public support came from?—No, I do not; they appealed to the whole trades of the country.

8800. And they received assistance from London, did they not?—I believe they did. They had a delegate in London soliciting subscriptions.

8801. I think you said that you know nothing of the circumstances of the arbitration that was proposed to them in North Staffordshire later on?—No, they did not consult us upon that question at all. I saw it in the paper after it had taken place.

8801*a*. Did you continue to give them any support from your association after that arbitration was refused?—Not till Mr. Bates, the employer, Tunstall Works, refused to employ the mill-men.

8801*b*. (*Mr. Booth.*) How long did that support of the men whom you have described as victims continue to be given?—Till they obtained situations. There are some of them who have only obtained situations about two months ago.

8801*c*. You went on to give them support until they had found situations?—Yes.

8801*d*. (*Mr. Mathews.*) You reside at Brierley Hill, I think?—Yes.

8801*e*. And you are the secretary of the Brierley Hill Association?—Yes.

8801*f*. Are you a paid secretary?—Yes.

8801*g*. What is your rate of pay?—3*l*. a week.

8801*h*. Are you at work now, except as secretary?—No.

8801*i*. What was your previous occupation?—Puddler.

8801*k*. In what work were you engaged when a puddler?—At Round Oak, the Earl of Dudley's work.

8802. How long is it since you discontinued being a puddler?—Four years and nine months.

8803. You voluntarily resigned your duties as puddler, I suppose, to become secretary of the association?—The men of the work formed a deputation and waited upon Mr. Richards, the manager, to state that they had a desire for me to be the secretary. The association started during the strike of 1863, and I acted as secretary for them during that strike.

8804. Were you then in the employ of Lord Dudley?—Yes.

8805. Then when the strike took place you discontinued being a puddler, and you became secretary to the union?—Yes.

8806. In giving notice on the part of the masters to the workmen for a reduction of wages, is it customary to give notice except upon a reduction in the price of iron?—In some instances the notice has been given when the men have perceived that an advance in the price of iron has taken place.

8807. What I want you to answer is this, whenever the masters give notice to the men for a reduction of wages, it is incidental upon a reduction in the price of iron, is it not, and they never give notice for a reduction of wages unless compelled by a reduction in the price of iron?—I cannot say that. That statement is given generally to the men by masters.

8808. That is the general impression?—Yes.

8809. That impression has never been contradicted I believe, but it is a fact of common notoriety?—Yes.

8810. Are you aware what proportion in the cost of a ton of bar iron consists of wages, and what proportion consists of other charges that do not fluctuate? Have you ever given that any consideration?—No, I have not made a calculation on that head.

8811. Suppose it should happen that 80 per cent. on the cost of a ton of bar iron consists of wages alone, in the event of a reduction of 1*l*. a ton, would it not be absolutely necessary that the wages should fall in proportion, in some degree, to the fall in the price of iron?—Yes, I suppose it would; but I do not think that there would be 80 per cent. off wages in the cost of manufacturing a ton of bar iron.

8812. Suppose I were to say that that is about the established rate, assuming that to be the case, would not that involve an absolute necessity on the part of an employer to reduce the rate of wages in some degree proportionate to the price of iron?—Providing that in minerals and other materials used in the manufacture of iron a change had taken place, of course it would be necessary.

8813. As you are aware, a reduction extends, generally speaking, to all departments in Staffordshire, not to puddling alone?—Just so.

8814. In point of fact, the rate of puddling chiefly regulates the rate of wages in other departments?—It has hitherto done so.

8815. In the event of such a state of things taking place as that of which you have just given us a description in North Staffordshire, where there is one district which stands out and refuses to accept a reduction of wages in consequence of a reduction in the price of iron, and the men from several other districts as well as from London continue to support those men in a strike, does not a lock-out become absolutely necessary on the part of the masters as a measure of self-defence?—I should not think that they would be justified in locking men out; I think that more amicable terms might be come to.

8816. But in the absence of amicable terms, when every effort has been made by negotiation with the men, by an offer of reference to arbitration, or by any other suggestion, and all these have failed, would it not be a matter of self-defence on the part of the masters to lock-out till by some means a settlement was brought about?—Lock-outs are objectionable to both men and employers, I have no doubt, but it is a means which has been resorted to by employers.

8817. But what I want to ask you with reference to those means having been resorted to by employers, is this,—in the absence of any other means of adjusting a disputed question, does it not become absolutely necessary on the part of the masters to adopt those means rather than suffer themselves to have one district stand out which is supplied with money by the other districts, in order to bring those districts that are at work into a position to compel an advance of wages?—I do not think that there was any necessity for a reduction, myself, at that period, else why should the employers hesitate about reducing the iron at their meeting in June 1864.

8818. Was not the price of iron, in fact, reduced?—Yes; Mr. Foster reduced it 1*l*. a ton.

8819. If Mr. Foster, being one of the chief makers and best makers, and one of the most influential ironmasters in Great Britain, finds it necessary to reduce the price of iron 1*l*. a ton, would it not be impossible for other ironmasters to maintain the price after that?—Yes.

8820. Then the reduction of wages became an absolute necessity?—Yes; unless they were willing to sink their profits.

8821. And to incur a very considerable loss?—I do not know about the loss, I think that the profits are enormous.

8822. Have you any means of ascertaining the profits?—Nothing more than the public statements of accounts in the papers.

8823. Are the public statements in the papers better than the ironmasters own statements?—I refer to certain joint stock reports.

8824. What reports?—Those of the Patent Shaft Company, Wednesbury, for instance.

8825. They are a company to make a peculiar sort of wheels and tires and axles; they are not ironmasters in the usual sense of the term, but their trade consists chiefly in the finished article, does it not?—Also puddling and manufacturing all kinds of iron, excepting pig iron.

8826. That is to say, they puddle their iron for their own use, not for sale?—I do not know, I never made that inquiry. Another case is the report of the Regent Works at Bilston. It showed that Mr. Beard, before he failed, had been making 3,000*l*. or 4,000*l*. a year profit.

8827. How came he to fail, then?—Because he entered into foreign speculations. He was a workman, I believe, about 10 years ago, a boiler plate roller, and worked in the North of England.

8828. And Mr. Beard being a boiler plate roller, and having a considerable amount of ingenuity, raised himself to the position of an ironmaster, and according to your account he continued to make large profits as an ironmaster, until he failed, owing to a foreign speculation?—Yes.

8829. If I were to tell you that I was a creditor of Mr. Beard, and knew his circumstances well, and

Mr. W. Hobson.

21 Nov. 1867.

that the statement of his failure being owing to foreign speculation was an entire mistake, should you believe me?—Yes.

8830. You state that you had reason to believe that owing to certain negotiations the North Staffordshire ironmasters were willing to set the men on at half the reduction?—Yes.

8831. Were there any other ironmasters, except Mr. Bates, that had that sort of negotiation with their men?—I have the statement of each of the delegates. This was the statement (I am reading from the minute book) that the deputation gave in at Tunstall, "that "Mr. Bates stated that the deputation had taken the "right steps in order to bring about a reconciliation if "possible, he was quite willing to meet the men half "way if the rest of the masters would. Biddulph "Valley Works. Mr. Heath stated that they would "force the whole reduction." "Newcastle. There "was a meeting of the North Staffordshire masters at "Stoke on the 12th instant, and if they were willing "to accept the concession of the men, 6*d.* per ton "instead of 1*s.*, of course he would have no objection."

8832. Was there any concession on the part of the ironmasters at that meeting to accept the compromise; did they so accept it?—No.

8833. Then there was nobody but Mr. Bates that you are aware of who negotiated with the men for accepting the five per cent. reduction instead of the 10?—And the master of the Newcastle Works in North Staffordshire stated that if the masters at the meeting at Stoke, that would be held on the 12th of that month, were agreeable to meet the men half way he would be agreeable.

8834. But they were not agreeable?—No.

8835. There was a good deal of negotiation, I think you stated, between Mr. Bates and his men. That was not only with respect to the compromise of the reduction, but with respect to other circumstances, I mean about his men wanting to discharge a manager, or something of that sort; are you aware of that?—There were so many disputes between Mr. Bates and his men that it is impossible for me to bear them in mind.

8836. And Mr. Bates was a good deal harassed in consequence of those disputes?—Yes.

8837. What number of men did Mr. Bates employ, are you aware?—No; I think that many disputes were brought on through injudicious management, such as employing double the number of hands required, and allowing men to absent themselves just when they thought proper.

8838. Has not the result of these troubles and negotiations between Mr. Bates and his men been an entire stoppage on the part of Mr. Bates and giving up the iron trade altogether?—I believe it has.

8839. Did not Mr. Bates on abandoning his business and closing his works state that he was obliged to do it in consequence of being so much harassed by his men?—That was the statement inserted in the papers.

8840. There was no doubt of the fact that Mr. Bates's works were stopped and all his men discharged?—Yes. He had had losses at times owing to the mismanagement of managers.

8841. With respect to South Staffordshire, has there ever been any difficulty on the part of the ironmasters in cases of notices for a reduction of wages on the one hand, or notices for an advance on the other, in having friendly conferences with their men?—In some instances; but speaking generally, when the masters have met the men the differences have been brought to an amicable settlement.

8842. By friendly communication?—Yes.

8843. That is to say, when the men employed in a particular work applied to the masters of that particular work there has seldom been any difficulty in adjusting the dispute?—In the Brierley Hill district, ever since the strike of 1863, they have been able to settle every difference excepting one, and that was at the Blockmoor tinworks, the men came out at the request of their fellowmen in the Tivedale district.

8844. Take the large works in South Staffordshire, Mr. Foster's, Knight and Company's, the New British Iron Company's, and Lord Dudley's, has there ever been any difficulty on the part of the employers there in conferring with the men?—No, they have met their men on friendly terms.

8845. There has never been any disinclination as a rule on the part of the South Staffordshire ironmasters to meet the men?—No, they meet the men and the officers of the association.

8846. When the officers of the association are not employed in the particular ironworks, is there not an indisposition on the part of the masters to discuss matters with those officers?—In a few instances.

8847. They like discussing matters with men in their employ, but not with men not in their employ?—They prefer discussing any difference with their men alone, but if the men wait upon them and desire an interview for the officers of the society they have invariably granted it to the officers and the men together. I have waited upon Messrs. Brown and Freer several times in order to settle matters.

8848. And do you mean that they have not expressed any disinclination to discuss those matters with you as an officer?—No, they have not; indeed the manager has sent up to our office to ask me to get men when men have been required.

8849. Do you think that the operation of the unions have succeeded in bettering the condition of the men in South Staffordshire?—I do.

8850. How did they better the condition of the men if it is the case that there is no disinclination on the part of the masters to meet the men themselves without the intervention of the union?—Prior to the union commencing the men were subject to many evils. If there was too much sulphur in the puddled ball, for instance, they had to pay 1*d.* fine; the shingler would have half of the fine, and the other half went to a club. They were also subject to breaking what is called calcined cinder, and other labour; there were many evils attached to the trade which the union has dispensed with entirely.

8851. All those would resolve themselves into a question of wages, would they not?—Of course they would. The employers have to employ a man to do this work now, whereas the puddlers used to do it.

8852. Take the question of sulphur in the puddle ball, the sulphur in the puddle ball is owing to carelessness in the puddler, to imperfect puddling, is it not?—Sometimes.

8853. Generally speaking, is it not?—That rule would be established in order to make them more careful, of course.

8854. Formerly they were fined for that?—Yes.

8855. What do they do now; do they not reject the puddle ball altogether if it has sulphur in it, without fining the man?—Not always. There is not so much sulphur in the iron now as there was three or four years ago; there is more cinder in it, and of course that destroys the sulphur.

8856. That is to say, the puddling is more carefully done now than it was formerly?—There is more labour attached to it than there was formerly. I am under the impression it is the influence of the union that dispensed with that system.

8857. Did the influence of the union operate in the way of making the puddlers attend to their duty better?—In some instances. The employers in South Staffordshire state that the men have been more comfortable and more sociable together since the union commenced, and that they have had less difficulty in managing them in consequence of the union not encouraging men ceasing work when there is any extra grey iron taken to be worked or any other alterations are taking place, without first waiting upon the employer to get redress; whereas before the union commenced the men used to cease working instantaneously, and strikes used to be of frequent occurrence.

8858. Generally speaking, if the masters are willing to meet the men, and the men willing to meet the masters, there is no difficulty at all on the part of the

masters in endeavouring to settle all questions of dispute without the intervention of the unions, is there?—I think that there are many of the managers who would not be so generous, so willing to meet a deputation of the workmen, if they had not the union behind them.

8859. I am speaking of the employers themselves, not the managers. Take Mr. Foster, take the British Iron Company, or take the chief agents of Lord Dudley—there is no difficulty made on the part of those gentlemen to meet their workmen and discuss these things in a friendly and conciliatory spirit, is there?—They will meet their men after they have endeavoured to settle the affair with the manager, and when they cannot settle it with him.

8860. But it is not left to the manager to settle a question under a strike, is it?—No; but if any dispute should arise in the work, and the men made application to the employer first, he would say that he left all matters to the manager.

8861. In a question of wages the principal would feel bound to come forward himself, while all minor matters would be left to the manager, I presume?—Wages and all other matters have first to be laid before the manager.

8862. As to sick clubs, are there any sick clubs in the district except those that are associated with the unions?—A great number.

8863. And they work well and for the benefit of the men?—Yes, in some instances; but there are failures of some of them. Some of them are attached to large ironworks.

8864. Where they are attached to large ironworks, and the principals take charge of them, generally speaking they are advantageous things, are they not?—Yes, they are a benefit to the workman, but cases have been known in which, if the workmen should disregard anything that the manager requires him to do, they have refused him benefit in sickness.

8865. Is not that the case in the unions also—if the men do not obey the dictates of the union they expel them from the union, and allow them nothing from any benefit there?—Yes, if they violate the law of the union.

8866. You have no complaint in South Staffordshire on the score of payment of wages in truck, have you?—No.

8867. They are all regularly paid everly fortnight in money?—Yes; I believe that they used to pay them at ——— works in cheques. The men used to be expected to have 4*s.* out of the 1*l.* wages from the truck shops, and they are expected even now to have something there, although they are paid in cash. It is optional to them, but if they neglect to attend at the store, of course they are not favourites in the works.

8868. That is the only work in South Staffordshire that has resorted to that proceeding, is it not?—Yes, I believe so.

8869. Has not that been a matter of complaint and grievance before the petty sessions recently?—Yes.

8870. So that with that exception, generally speaking, the wages have been paid in cash properly?—Yes. Two or three men have been victimized in consequence of taking a prominent part in getting that truck system abolished; two men, named Vaughan and Williams, sent a letter to the "Daily Post" this week in consequence of it.

8871. What is the nature of the agreement between the workmen and the employers as to discharge?—It is generally understood that they should take and give 14 days notice.

8872. And that is generally adhered to?—Yes.

8873. A master never discharges a workman without giving him 14 days notice, except for a grave reason?—They generally find a reason when they want to get rid of a man. There are always plenty of grievances connected with the puddling department in the manufacturing of iron, and they are not at a loss to find some fault if they disapprove of the conduct of the man.

8874. And then they discharge him without notice?—Yes.

8875. Is not such a case brought before the magistrates, and is not the sufficiency of the reason tested before the magistrates in case of his discharge?—There have been instances where it has been tested, and invariably the men have failed to establish their case.

8876. Then the right has been with the masters, I presume?—The magistrates have been generally ironmasters, and they are sure to decide rather unfavourably towards workmen.

8877. On the contrary, is not it the fact that those ironmasters who are magistrates very rarely interfere in disputes between masters and men. Is there not a stipendiary magistrate who takes all those cases at Brierley Hill, at West Bromwich, at Wolverhampton, at Bilston, and so on; and is it not the custom of the trade to refer by courtesy all cases of that nature to the stipendiary magistrate?—I have not noticed that particularly, but I know that in some instances it has taken place.

8878. Do you not know that at Brierley Hill there is a new police station, where the stipendiary magistrate alone sits, unless he happens to be away from home?—Yes.

8879. So that any imputation on the magistrates of the districts of acting partially and against the men would have no ground where a stipendiary magistrate is established?—There are very few breaches of contract occurring in our locality.

8880. So that upon the whole, as far as South Staffordshire is concerned (which you of course know as well as I do), the relations of the masters and the men are fairly and amicably conducted. No material cause of dispute arises except in cases of notice for a reduction of wages on the part of the masters, or notice for a rise of wages on the part of the men?—No, few disputes or differences have arisen, but I am of opinion that they would have done if it had not been for the influence and instrumentality of the union. There are two cases that have come under the notice of the union. The puddlers at Messrs. Brown's works and at the Round Oak works were receiving 6*d.* per ton extra for hoop iron, and in consequence of a resolution passed at the ironmasters quarterly meeting showing up that it was an innovation, they requested the two firms to discontinue paying the men; they gave them 14 days notice. If the union had not stepped in and advised the men to accept it, there would have been a strike. And likewise in the case of the last notice that was given for a reduction of 6*d.*, if it had not been for the association advising the men there would have been a strike; but since the officers of the society advised the men to accept that reduction, something like 300 or 400 members fell away from the union because the officers would not allow them to strike.

8881. Have you had much experience as to the relations of the masters with the men previous to the establishment of these unions?—There were constantly grievances occurring. In 1852 a strike occurred and they obtained 1*s.* a ton; there was no union then. In 1845 a union commenced, and it existed till 1847. The employers then issued orders that they would not employ any man that belonged to the society, and, consequently, that annihilated the union, and it did not spring up again 'till the grievance came on in 1863.

8882. Since the establishment of the unions there have been more causes of contention between the masters and the men than there were previously, is not that the case?—No.

8883. Have not strikes been more numerous since the establishment of unions in Staffordshire?—They have been of more magnitude, but the men have been invariably acting on the defensive.

8884. The fight has been fiercer, and has involved a greater loss on both sides than previously to the establishment of the unions, is not that the case?—

Mr. W. Hobson.

21 Nov. 1867.

Mr. W. Hobson.
21 Nov. 1867.

Yes, there have been larger contests, but that is in consequence of the number of men that have been employed, and having a better system to carry the contests out. Before the union commenced the iron-workers had to submit to anything that an employer or manager dictated.

8885. But did the custom differ previously to the establishment of unions from the custom now; that is to say, was it not the case that no notice was given to the men for a reduction of wages save from a reduction in iron, and that when the price of iron rose the men generally gave notice for an advance, and it was conceded?—In the October meeting prior to 1863 iron advanced 7*s.* 6*d.* per ton, and the men waited upon their employers for three months in order to get their employers to advance their wages, and the employers refused to do so.

8886. Was not the reason alleged for the masters not immediately advancing iron that they were all covered with contracts at low prices, and that they could not avail themselves for two or three months of the advance in the prices?—The employers did not state that to the men; they said that they could not afford to advance the puddlers rates.

8887. Was it not stated publicly in the papers that they were covered with contracts, and that it would take two or three months to work those contracts off, but that when those contracts were worked off they would be perfectly willing to meet the demand of the men?—When the iron advanced in October the men in Biddulph Valley struck, and they were out five weeks.

8888. I will not take you back again to North Staffordshire, but I will ask you generally whether the usual rule on the part of the South Staffordshire ironmasters is to advance the men when the price of iron advances, and to give notice of reduction when the price of iron falls?—I think that if the employers had adopted that system there would not have been any association now; if there had been that system, they would not have needed the association so much.

8889. Is not that the understood relation in which the masters and men stand with each other?—If it was an understanding, I suppose it must be a verbal one, that when the bar iron advanced 1*l.* a ton the puddlers would receive 1*s.* more per ton, but of course the puddlers discountenance that sliding scale in consequence of their earnings being so low.

8890. They discountenanced that scale simply because they contended that they should have a higher price for puddling in relation to the price of iron than they got formerly?—They discontinued it because they thought that the list price was not honest, that their masters could state any price in the list, and at the same time be selling it for 2*l.* or 3*l.* per ton more. There is a complaint now in some of the works that the men are working hoop iron for 8*s.* 6*d.* per ton, and that the employers are selling the iron for 9*l.*

8891. Are you quite certain that hoop iron is fetching 9*l.*?—It is, at this work which I am alluding to.

8892. I suppose that that is an exceptional work, which makes iron of a good quality?—It is; in quality it is something like steel iron.

8893. Is it not the fact that the list price of iron is confined to all but a few works in Staffordshire who make iron which cannot be made in any other district, and which command in consequence of that extra quality a better price?—I do not think that the Earl of Dudley goes by the list price. I am under the impression that he receives 1*l.* a ton or more for his iron than the list price.

8894. That is owing to the particular excellence of Lord Dudley's minerals I suppose, and the excellence of his manufacture, and other things, that enables him to get iron of a better quality?—Most of the works in South Staffordshire get almost as good iron as Lord Dudley.

8895. Why does Lord Dudley get a better price? It is not because he is a lord, is it?—I do not think that he sells at a higher rate than his neighbours any more than that they make another inferior quality.

8896. The large bulk of South Staffordshire iron does not present, does it, the excellence of quality of Lord Dudley's, or Mr. Foster's, or two or three other firms who have established that reputation for excellence of quality?—Of course those firms are considered the first firms as regards quality.

8897. You stated, I think, that Lord Dudley gets a higher price than his neighbours?—He gets a better quality of iron, but no better than some of the other firms; the other firms go lower in the quality; they buy a commoner material; they work two or three sorts of common iron, and the Earl of Dudley's; what they call common iron is generally of a regular and good quality.

8898. (*Mr. Merivale.*) I understand your opinion then to be, if I am right, that the ease with which masters and managers admit discussion of questions with their men now is partly owing to the fact that the men have a union behind them to back them?—Yes.

8899. Can you speak from recollection how it was before that union was in force, whether there was less accessibility on the part of the masters then than there is now?—The men invariably had to cease working before the managers or the employers would meet them.

8900. That is your impression?—Yes; there were exceptions, but it was the general rule among men to cease working whenever they had any grievance.

8901. (*Mr. Mathews.*) But previous to the establishment of unions, do you mean to say that there was ever any greater difficulty on the part of the men to get access to their masters than there is now?—There was a greater difficulty in their getting the employers to concede an alteration.

8902. Pardon me, was there a greater difficulty in getting access to the masters, and having discussions with them?—They would not meet the men except in extreme cases, I mean extreme grievances.

8903. Do you mean to say that there was less inclination on the part of the masters to meet the men than there is now?—Yes, they left it more to the managers.

8904. (*Chairman.*) Can you tell us what proportion of the puddlers are in the union?—At the present time there would be in South Staffordshire something like 900 to 1,000 puddlers in the union.

8905. And how many are at work?—I suppose that it would comprise something like 3,000 or 4,000 if all the puddling furnaces were in operation, but I cannot say how many are in operation now.

8906. Were you at work before the union was established?—Yes.

8907. Did you ever make an attempt to make a complaint to the employer, and were you refused a hearing?—I worked under two principal firms. I was under the Williams's Company, and under the Earl of Dudley, and I invariably got an interview with the employers when I wanted any grievance to be settled under those two firms.

8908. You stated that before the unions were established the workmen found difficulty in getting heard, and that their way of getting heard was to stop work. My question was, whether you have ever had any experience of that yourself, or were speaking from what other people have told you?—I was speaking from the knowledge I had of other men under other firms. There are a great number of firms, in fact there are 20 works in the Brierley Hill district,—that is east of Dudley.

8909. (*Mr. Harrison.*) Do you mean that there was readiness to meet individual men before the formation of the union, but a great difficulty in obtaining interviews for a body of the men?—Just so.

8910. (*Mr. Mathews.*) Is it not the custom in seeking an interview with a master, not for one man to go but half a score or a dozen of the most intelligent of the men, who are generally speaking con-

sidered the organs of their fellow workmen. The masters do not restrict the number coming to them, unless they are inconveniently large, do they ?—That is the custom now, but prior to the union the employers would say, "I will meet so and so," and they would object to meet a body of men.

8911. Do you mean to say that prior to the establishment of unions there was ever any disinclination on the part of the South Staffordshire ironmasters to meet any number of their own men who sought an interview with them ?—On two occasions Mr. Smith has pointed out myself and two men to state the case of the whole men, for he would not meet the body. At some other works the employers would not meet the men at all, and the manager invariably had to settle the difference between them.

8912. Was that the case in any dispute about wages ?—I cannot say ; it is the greyness of the iron and the alterations in the materials which puddlers work with that used to be the greatest grievances.

8913. Those are matters of detail, but in any question about wages, or any grave question affecting the welfare of the men, previous to the establishment of the unions, was there any disinclination on the part of the masters to meet any fair number of men that wished to discuss those points with them ?—I can only speak on that point of what happened at the Earl of Dudley's.

8914. Do you think it probable that if you had said to Mr. Smith, "I would rather bring three or four others of the intelligent men," he would have said, "I will have nothing to do with you"?—I do not know that he would.

8915. (*Earl of Lichfield.*) You stated that an arrangement existed between the masters and those employed in South Staffordshire, under which the rate of wages was guided by the price of iron, and I think you have mentioned one or two cases in which when the price of iron was raised wages were not raised by the masters, have you not ?—Yes.

8916. Do you know of any cases in which when the price of iron was reduced the wages were not reduced ?—Wages were not reduced in 1864 for six months after the reduction in the price of iron of 1*l.* per ton, when a lock-out took place.

8917. The reduction, then, was 1*l.* a ton, you say ?—Yes ; 1*s.* a ton in wages prior to and after the lock-out.

8918. (*Mr. Harrison.*) Could you answer, now, the question which arose in the course of Lord Lichfield's examination with respect to what you call the victim fund, or those members who were supported on the ground that they were refused employment. Were the leaders or the managers of the strike officers of the society, and about what number did they amount to ; what was the history of that matter ?—I could not exactly give you the number of men now, but there were a great number of them that were refused employment. Some of them had to be sent to Scotland, others to the North of England, and others came into Staffordshire.

8919. Was the strike on that occasion prolonged on the ground that those who had been the prominent leaders of it were refused employment, and because the men for some time declined to go to work until that was removed ?—Just so ; they met the employers on several occasions, and stated their determination not to commence unless the whole of the men were allowed to commence : ultimately they had to commence without them.

8920. Ultimately they did go in, leaving the prominent leaders in the movement excluded from the works ?—Yes.

8921. Those were the men supported on what you call the victim fund ?—Yes.

8922. Could you give us anything like their number, or any information as to who they were ; were they men who had been secretaries ?—They had been the most prominent men during the strike.

8923. Not necessarily men who have held office ?—Some of them had held office as officers of the committee during the strike.

8924. Yourself for instance, do you contemplate or did you ever find any difficulty in obtaining employment since this occurrence ?—I have not had occasion to seek other employment since.

8925. But you would have no difficulty in obtaining employment, would you ?—I question that.

8926. There was a question which arose out of an answer which I did not fully follow. I think you said, just now, that on a certain occasion at two works the price of wages had been raised 6*d.* a ton, and that then the Ironmasters Association interfered and exerted some sort of pressure upon those two firms to withdraw that increase, is that so ?—Yes.

8927. What was the mode in which that proceeding was carried out ?—This quality of iron was hoop iron, and was worked at most of the works in Staffordshire, and the men waited upon their employers, Messrs. Brown and Freer, and obtained the 6*d.* per ton advance, in consequence of the Earl of Dudley paying 6*d.* per ton more than any other master in the locality, and as soon as Messrs. Brown and Freer conceded it the question was laid before the ironmasters meeting (it was then near to their quarterly meeting), and the resolution was issued from that meeting that they recommended Messrs. Brown and Freer and the Earl of Dudley to discontinue paying that rate to the men, as they considered it an innovation in the trade.

8928. Then the men you say were upon that prepared to strike ?—They would have done so if they had not been advised by the union.

8929. You advised them to accept it ?—Yes, to accept the reduced rate ; to allow the 6*d.* to be taken off the rate paid for hoop iron.

8930. Have the principal strikes which you have been engaged in, or which you have known in the last few years, been strikes for the purpose of obtaining an increase of wages beyond what was at that moment being paid, or by way of resisting a reduction ?—They have been generally with a view of resisting some grievance or a reduction in wages. For instance, the Liverpool Mersey work dispute arose out of the masters giving notice to the labourers for a reduction, and they (the employers) took advantage of the notice that was given, and stated that they should not be able to carry their works on, and that before any of their workmen commenced working there again they would all have had to re-engage, and thus the men designated it as a lock-out.

8931. I will take these more prominent strikes mentioned in Mr. Jones's paper. For instance, the Staffordshire strike of 1863, was that for an increase of wages ?—Yes, for an advance of 1*s.* per ton.

8932. Was that over and above the increase of the selling price of iron per ton, or was it to follow an increase ?—The men based their rate of wages then upon the selling price of sheet iron. They said that they should discontinue the plan of the rate of wages being regulated by the selling price of bar iron, so that it would be in accordance with the pounds per ton that sheet iron was sold at that period.

8933. Coming to the second, the Leeds lock-out in 1864, was that connected with a demand for increased wages ?—I think not, of course that affair was under the northern district.

8934. That related to the declaration for the purpose of breaking up the union ?—Yes.

8935. The third strike is the North Staffordshire strike of 1865, was that for the purpose of an advance of wages ?—It was to resist a reduction.

8936. The Mersey Iron and Steel Company's strike of 1866, what was the purpose of that ?—It was to prevent the employers from annihilating the union. They objected to employ men unless they would give a pledge not to belong to the union.

8937. Then as to the north country strikes in 1866, have they been in consequence of demands on the part of the men ?—In some instances, I believe ; Mr. Millington will be able to answer those questions more thoroughly.

Mr. W. Hobson.

21 Nov. 1867.

8938. In the cases of those strikes with which you have been personally concerned, what cases of outrage or violation of law have been proved against the society or its officers?—None to my knowledge.

8939. (*Chairman.*) Have you had a strike since you have been secretary?—There have been strikes in Staffordshire.

8940. I understood you to say not as far as your society were concerned?—There have been several strikes.

8941. In which your society were concerned?—Yes.

8942. (*Mr. Harrison.*) In the Staffordshire strike, what cases were brought into court against members of the union as members of the union for trade outrage?—There was a case at Derby for intimidation, but there was no committal. The matter was stopped by the men accused promising not to interfere with the men again during the strike.

8943. Do you feel confident that that was the only case that was brought into court?—At Liverpool I believe there was a case, but of course the men defended it themselves. The society had nothing to do with it except that it just came under their notice.

8944. Do you know anything about the circumstances of the Low Moor strike of 1864?—You mean the strike connected with the Leeds lock-out. No, that dispute belonged to the Gateshead association.

8945. You personally know nothing about the state of things in Wales perhaps?—No.

8946. Have you ever had any strike or other difficulty, in your experience, arising out of the forfeit of work as being short of measure or weight?—No; there are places where the puddlers are tied to yield, and if they come under that weight the employers inquire into it.

8947. (*Mr. Mathews.*) Is it not a custom in case of any prolonged strike in the South Staffordshire or other districts to put on some of the under hands to puddle?—Yes.

8948. It is the custom, that is, to educate the under hands into puddlers during any prolonged strikes?—Yes.

8949. So that when the men resume work again it is impossible to put on all the men again, but some of these educated under hands assume the position of puddlers?—Some of them, but they are not all kept on working.

8950. And those men that are excluded because of that fact are said to be victimized?—Yes.

8951. Do you know that one of the large works in Staffordshire kept one of the forges going all the while a strike was going on with a body of under hands?—I believe that at Tunstall many under hands were employed.

8952. Do you happen to know that one of the forges was kept on with 50 hands for four months, and that one of the difficulties in adjusting the matter with the men when they resumed work was, that the men demanded to have all these under hands discharged, and that the proprietors refused to discharge them?—That did not come under our knowledge.

8953. The men did not claim under your society remuneration on the score of being victimized?—Not under those circumstances.

8954. (*Mr. Harrison.*) Do the men, as a rule, in your society decline to work in the same shop with non-union men?—No.

8955. Do they put any pressure on the non-union men?—No, nothing more than that they refuse to assist them.

8956. Into work you mean?—Yes, into work; they refuse to get situations for them. There is a rule to that effect.

8957. Do you mean that, as a rule, that they work together amicably in a shop when they are there?—Yes, side by side.

8958. You have no rule on the subject?—No.

8959. (*Mr. Mathews.*) Is it not the fact that if the majority of the men in a forge are union men and the minority non-union men, the position of the non-union men is made rather uncomfortable?—They do not associate with them, it is nothing further than that.

8960. They cold shoulder them, in fact?—Yes.

8961. (*Chairman.*) There can be no rule, I presume, against piecework in your trade, it cannot apply?—It is all piecework by the ton.

8962. There is no rule against over hours; the work must begin and end at so many heats, must it not?—Yes.

8963. Is there any limitation in regard to apprenticeship?—No.

8964. (*Lord Elcho.*) You know nothing of wages being forfeited or sacrificed in consequence of deficient work or defective work?—No.

8965. I refer to cases of plates or rails not being rolled to the proper length, in consequence of which the labour and the pay of that labour were forfeited?—That is the rule, I believe, in the trade. There is one case which has come before the notice of the association which occurred through the inefficiency of the manager, there were a great number of plates failed, something like 14 to 22 tons in a fortnight. It was brought before the notice of the association, and a deputation waited before Mr. Smith.

8966. Was that at Lord Dudley's works?—Yes, and the proprietor, in compensation, awarded them 15*l.* for the bad plates.

8967. These plates had been forfeited on the decision of the manager?—Yes.

8968. Then there was an appeal to the employer, and the employer allowed a certain sum to the men in consideration of this forfeiture not being right?—But not till the men had been on strike one week; they gave 14 days' notice to obtain it.

8969. Is that the custom in the iron trade?—I believe it is not.

8970. Of your own knowledge you cannot speak to any other instance than that one?—No.

8971. How did that case come before you; did it come before the executive?—Yes.

8972. Were these men during the week they were on strike supported by the association?—Yes, they had one week's support.

8973. That is the way in which you became acquainted with this case?—Yes.

8974. You have said that as a rule strikes have not taken place for a rise in wages, but that they generally take place to resist reduction?—They are more frequently to resist reduction than they are to obtain a rise.

8975. Have you ever known a reduction of wages in the iron trade that did not follow on a reduction of the price of iron? I mean, have the ironmasters ever reduced the wage and at the same time maintained the price of iron?—I do not know that they have.

8976. So that where strikes have taken place to resist reduction, it has been to resist a reduction which the masters wished to make in consequence of a fall in the price of iron?—It has been alleged by the employers that the iron has been reduced, and that they were necessitated to reduce the men's wages.

8977. Have you any reason to doubt the fact as alleged by the masters?—No, I have not.

8978. In this appeal to the public in general which you have referred to, in one paragraph it is stated that "Steps are taken by our employers to reduce our "wages; it is very unfair, the state of trade does not "require it." Now on what authority is such a statement as that issued by the district secretary, as to the state of trade not requiring it. What means of knowledge had that secretary, Mr. Baker, when he issued that statement, that the state of trade did not require the reduction of wages?—I cannot say further than what he gathered from the newspapers himself. That printed appeal was issued after the association adh refused to support the North Staffordshire men.

8979. I suppose that the secretaries and leaders of these unions and associations take counsel with and advise the men in these questions of strike?—The men generally lay the complaint before the secretary,

and he calls the whole body of men together, and lays the complaint before the whole body, so that it is invariably decided by the majority of members.

8980. Supposing that a complaint is brought before these officers with reference to a reduction of wages which the masters intend to enforce as far as they can, is any inquiry made by the officers as to the state of trade, and how far the masters are or are not justified in that reduction before that advice is given to the men who consult them?—Yes, they generally make inquiries into the state of trade, or should do, and advise the men for the best; but it is not all times that the men will take that advice.

8981. You say that they either inquire, or "should do." I ask whether they do?—They have in every instance that has come to my knowledge.

8982. In what way do they inquire?—They generally consult the different newspapers.

8983. Do they communicate with the employers and learn from them the reasons on which they are acting, as would be done in the case of arbitration?—The employers, of course, would meet their own workmen, but they would not meet anyone else to talk the matter of prices over.

8984. I thought you told us that there was no objection on the part of the employers to meet the officers of the union?—That is after the men have met them themselves, and when they cannot settle the affair in any other way. The officers of the association are then called in in order to see whether they can settle the matter amicably with the employers, and if the employers meet them the dispute is generally amicably settled. There are several instances where the association would not protect the men when they objected to the settlement agreed upon.

8985. Have you any knowledge in your association or in your trade of a system of arbitration having so many employers and so many men forming a sort of committee to consider these questions?—I think that it would act beneficially.

8986. But you know practically of none at present?—No.

8987. Are you favourable, and do you hear that the men themselves are favourable to such a system?—That question has not been under the consideration of the men, but I have no doubt that they would be favourable to it, for I think they would adopt any consistent system in order to put an end to strikes and lock-outs.

8988. Have you ever known a meeting between masters and men, in which you have found the masters unreasonable and unwilling to listen to complaints?—An employer at the Derby Work objected to meet the men, but I think it was in consequence of his leaving the affair to the manager. The manager and the men had a dispute, and he left the affair entirely to him to settle.

8989. But upon the whole, such cases are exceptional?—Yes.

8990. Then, on the part of the masters, do you believe that there would be any objection to the system of arbitration?—I cannot say.

8991. From your knowledge of the men do you think that they would be in favour of it?—Most of the men in Staffordshire who have come under my immediate knowledge are able to settle their differences with their masters themselves, with the aid of the officers of the society, and I think they would not object to a sysetm of arbitration, neither would the masters I think.

8992. You think that if masters and men were left to themselves or to arbitration they would settle these disputes. But that North Staffordshire case was not settled in consequence of the interference of persons connected with other trades, and who had no knowledge of the iron trade. That was so, was it not?—It was in consequence of the men being firm in wanting to resist a reduction. I do not know whether other trades stepped in.

8993. Their firmness came from London, did it not?—I believe most aid did.

8994. (*Sir D. Gooch.*) With regard to that 15*l.* which you say is paid, and with regard to deductions made from the men in consequence of the bad work, that means that if bad work is turned out from the mill the master does not pay the man for it; he is only paid for good work?—Yes.

8995. That is just and proper, is it not, to pay only for good work?—Yes, usually so.

8996. In this case the allowance was made to the men in consequence of the master being satisfied that there were such circumstances in the case that the men could not have turned out the work better?—Yes.

8997. As a rule the masters do not pay for what will not sell?—They will not.

8998. (*Mr. Mathews.*) Are such cases as those common in South Staffordshire; did you ever hear of another case besides that which you have mentioned?—No.

8999. They cannot be common then?—No.

9000. (*Chairman.*) If it be an admitted fact among the men and the employers, that wages and the price of iron stand in a given relation to one another, then it would come to this, that if there was a dispute about the rise and fall of wages, there was a dispute about the market price of iron?—Yes.

9001. (*Mr. Harrison.*) With respect to the forfeit of worked iron, it is the case, is it not, that the wages are stopped altogether for work which is not destroyed, but which is marketable and sold, although it is not the exact measure which is required; is not that so?—I believe it is. I believe that if there is an order taken into the mill, and the plates should not run their length or their width, they are placed on one side, and the workmen are not paid for them; but if an order should come that would make up for the rebate to them, then they are used.

9002. Have you ever known cases in which it has been rather an instance of deficiency of work, in which the work has been wholly forfeited, and not paid for, but the goods have been marketable, and have been sold?—No, I have not.

9003. (*Earl of Lichfield.*) Have you ever heard any calculation made of the loss that was entailed upon the district by the strike in North Staffordshire?—No.

9004. Looking to all the circumstances and the results, do you not think that that strike was originated and carried out upon very insufficient grounds?—Yes, I do.

9005. That is your opinion?—Yes, and it was the opinion of the whole association after they saw that the employers would not concede the terms offered.

9006. There appears to have been considerable difference of opinion about it, for it seems to have been condemned by the Ironworkers Association at Gateshead. Your opinion at Brierley Hill was that the profits of the masters were too great, and the reason assigned by the North Staffordshire men was that the circumstances of the trade where they were working were exceptional, and notwithstanding the opinion of the association, a strike was supported which entailed most serious loss upon all concerned in it; that is so, is it not?—Yes.

9007. Do not you think then that those who assisted in supporting that strike up to the last moment must be parties very much to blame?—Of course the whole association blamed them, when they would not act up to the resolution and prevent a lock-out.

9008. You yourself not being able to give us any direct information with regard to the circumstances of the strike in North Staffordshire, can you refer to anybody who would give us some further information upon the subject? I see that there is a paper here signed by Mr. Baker, would he be able to give us information on the subject?—I should say he would.

9009. Especially with regard to the refusal on the part of the men to accept the proposal made by me for arbitration?—Yes, the whole of those men who refused were composed of men in North Staffordshire.

9010. Do you know where Mr. Baker lives?—At

Mr. W. Hobson.

21 Nov. 1867.

Plex Street, Tunstall. He has no connexion with the association now.

9011. (*Lord Elcho.*) You have said that this firmness which led to the continuance of the strike in North Staffordshire came from London; in what form did it come? Did it come in the form of a letter recommending them to strike, or in the form of a deputation, or was there any individual that went down to Staffordshire?—It came in the form of support. I think there was an individual that went down, but whether it was Mr. Troup or Mr. Potter I cannot say. Mr. Potter was at a meeting at Manchester, and condemned the policy of the Brierley Hill executive, and the Brierley Hill executive instructed me to write a letter condemnatory of Mr. Potter's conduct in advancing the statements which he did at the meeting in Manchester.

9012. Then it was either Mr. Potter or some other gentleman from London who went down?—I believe it was.

9013. Was either of those gentlemen who went down an ironworker conversant with the iron trade?—No, I believe not.

9014. So that two persons from London, knowing nothing about the trade, went down from London to Staffordshire to advise in a matter of trade dispute between employers and employed?—Yes.

9015. And they prevented a settlement which would otherwise have been come to?—I do not know whether they prevented a settlement or not. I never made that inquiry. Of course it may have strengthened the men in remaining out.

9016. At least the men would have gone into their works had it not been for that interference?—They would have been compelled without aid to do so.

9017. And a promise of support which was not fulfilled when the time came?—Very meagrely.

9018. You say that you were, in consequence of this interference and those results, instructed as secretary to write a letter condemning the course which had been taken?—Yes.

9019. Are you aware that a printed circular coming from what is called the National Association of Ironworkers, signed J. Kane, towards its close speaks very strongly upon this question of the interference of persons coming down from London?—I am not in possession of that circular.

9020. That shows, does it not, that the feeling in the district was very strong against the interference in their affairs by persons in London?—I am not in possession of any of those circulars. Of course our association did not encourage it.

9021. Was any testimonial presented on that occasion to anybody from London?—There was a testimonial presented to Mr. Potter, but it was in consequence of the services that he rendered in assisting to establish our society, and not for the North Staffordshire affair. The trades of the country appealed to our society, and of course we rendered similar assistance to that testimonial fund which other trades rendered.

9022. Was that testimonial presented after the dispute or before it?—It would be after the dispute. The question had to be laid before the conference which was held at Derby; and then it had to be laid before the delegates of the whole association, it was they who voted a sum of money from the funds.

9023. (*Earl of Lichfield.*) What is the scale which you have referred to regulating the wages?—There has not been any scale acknowledged since the association of the men. Prior to the association the ironmasters used to advance and raise wages at their quarterly meetings as they deemed proper.

9024. But latterly upon what scale have the wages been fixed? You have referred to a scale which you have said had been departed from in one or two instances?—It was the selling price of sheet iron, the rate at which the puddlers are now paid is 1*s.* per ton, the employers assert, above the price at which they fix the rate of wages. They say that bar iron is the rate that they fixed as the standard, and that puddlers are receiving 1*s.* a ton more than the actual selling price. The selling price of bar iron is 7*l.* 10*s.*, and the puddlers are receiving 8*s.* 6*d.* per ton.

The witness withdrew.

Mr. W. Garner.

Mr. William Garner examined.

9025. (*Chairman.*) I believe you are the secretary of the Millmen's Association at West Bromwich?—Yes.

9026. How long has that society been established?—Four years.

9027. Have you all the rules of the society and the accounts of the society with you?—I sent the rules up to the secretary, but the accounts I have not brought with me. I can send our reports up to you.

9028. Have you monthly and annual reports?—Every six months we publish a report.

9029. You can send them and they will show your receipts and your expenditure, and probably the number of your members?—They do not contain the number of members. I will send that.

9030. It is established, I suppose, partly for the purposes of a benefit society, that is, for a sick fund and superannuation, and other provisions of that sort, and partly for the purposes of a trade society, that is, providing for the time when you are out of work, and loss of tools, and other accidents that are peculiar to artizans in that trade?—There is no sick benefit connected with it. We tried to establish one after it had been in existence two years, but we found that most of our members were connected with one or two other sick benefit societies at the time, and of course the idea was quashed.

9031. And does that apply to superannuation also?—Yes.

9032. You have no sick benefits or superannuation fund?—No; we simply allow 5*l.* at the death of a member, at least we have done so for the last two years.

9033. (*Sir D. Gooch.*) Your union is simply a trade union?—Simply a trade union.

9034. What is your subscription?—It is according to the class of member. There are two classes of members, one pays 6*d.* per week, and the other pays 3*d.*, and they have a corresponding amount allowed them. The association is for the millmen alone. We have nothing to do with puddlers, which Mr. Kane and Mr. Hobson represent, but ours is for the finishing department only of the iron.

9035. (*Mr. Mathews.*) You reside at West Bromwich I think?—Yes.

9036. You are now secretary to the West Bromwich association?—Yes.

9037. You are a paid secretary?—Yes.

9038. What is the rate of remuneration?—I have 2*l.* 10*s.* per week, but out of that I have to pay my own travelling expenses for a certain distance round the office of the executive.

9039. How long have you been paid secretary of that association?—Close on $3\frac{1}{2}$ years now.

9040. Since you have been paid secretary to the West Bromwich Association you have not been actually engaged in work yourself, have you?—No.

9041. What was your previous occupation?—A mill furnace man.

9042. In whose works?—The last nine years I worked was at the new works that Messrs. Johnson put up at All End, West Bromwich, Staffordshire.

9043. When you left that employment you became secretary of this union?—Yes.

9044. Had you reason to be discontented with your occupation as a mill furnaceman?—There are very often a good many reasons why we should be discontented.

9045. It is a well paid occupation is it not?—Not so well paid.

9046. What is the ordinary payment per week of a good mill furnaceman?—I can find you places where they do not earn 1*l.* a week, and others at which they earn from that to 3*l.*

9047. And even more in some instances?—In very rare instances, but those are not the cases that you can take as a rule.

9048. As a rule it is one of the best paid departments in the trade?—Not the best.

9049. The pay of a head roller perhaps is better?—A head roller's is better, and my opinion is that it ought to be, brains ought to be paid better for than muscle. I see that in all the world around me.

9050. At all events the occupation of a mill furnaceman is one of the best paid departments in the trade except the head rollers?—I consider that two or three others are better paid. Stock-takers and roll-turners are far better paid. As a rule I think that mill furnace work is as hard for the wages as that of any skilled man working in the trade.

9051. As a rule they get good wages?—At some places, and at other places they get worse than labourers.

9052. Were you in the room when Mr. Hobson was examined?—Yes.

9053. I suppose you heard his answers to the various questions put to him?—Yes I did, and there are one or two cases in which I might add to his evidence.

9054. Generally speaking do you concur in Mr. Hobson's evidence with the exception of those cases?—I think that Mr. Hobson can give you as good a definition of how puddlers are treated as any man in the country, but as regards millmen I do not think that he is as good a man as myself to give you information, because he has not had the experience that I have.

9055. Irrespective of experience as a millman, his general expression of opinion was such, I suppose, as you yourself would concur in, as to the rate of wages being regulated by the price of iron for instance?—No, I object to that. In some instances I grant that they have done so in reference to puddlers, but there are plenty of instances which we can point out of employers stopping millmen's money for work done, and otherwise reducing their wages when there was no reduction on the iron; and I think I can supply plenty of evidence to show that masters do both the one and the other.

9056. Supposing a reduction in the price of iron, and a consequent reduction in the price of puddlers' wages, it follows that millmen's wages are reduced in a greater or less proportion?—It does. When an advance of 1*l.* takes place in the price of iron, puddlers' wages should rise 1*s.* a ton and millmen's 10 per cent., that is the rule, but it has not been carried out in practice.

9057. And in case of a reduction the same law follows?—Yes.

9058. But there are cases, you say, in which the same law is not observed, in the case of millmen?—Yes.

9059. Will you state what those cases are?—I will refer to one at Kidsgrove in the large plate mill which was as follows: the master had been accustomed to allow two labourers as helpers for all ordinary sized iron, I cannot say for certain the price paid, but think it was 5*s.* per day each, perhaps you will correct me if I am wrong. The master said I shall not pay these men again, but will put 6*d.* per ton on your tonnage, this would be a reduction equal to 3*s.* per day on ordinary iron, and if we calculate on the extra sized iron when more labour is required it will be equal to a reduction of more than 5*s.* a day of the roller. That has happened within this last six weeks at the very identical work you were at a short time since.

9060. Would not that arise from an impression on the part of the manager that the department was overpaid beyond the ordinary rules that attach to that department?—I place but very little confidence in the opinions of a large number of the managers whom the ironmasters have in South Staffordshire and North Staffordshire. It is not the men who are the most competent for the positions, but it is generally those men who can screw the most out of the workmen, that they put in the position of managers.

9061. At all events, these cases you now refer to occurred in North Staffordshire?—At the work at Kidsgrove.

9062. You have no connexion with North Staffordshire, I think, have you?—Yes, we have.

9063. Were some of the North Staffordshire men in your union?—Yes; all the millmen, or nearly all, with the exception, I think, of a few at Ravensdale, in the plate mill, when the strike took place in January 1865. Those were the millmen that Mr. Hobson said the master would not allow to begin again unless they left the puddlers union after the strike terminated. The men in the other five mills in the old works were connected with us, and in the large mill at the new works.

9064. Although the rule of 1*s.* a ton reduction in puddlers' wages is incidental to the reduction of 1*l.* a ton in the price of iron, I understand you to say that it is not carried out strictly in the same proportion in millmen's wages?—No, I myself have felt it to be otherwise. When the last reduction of 10 per cent. took place, before I left the works my master came to me and others in the mill and made us believe he was sorry he had to reduce us, and added "leave it to me, you shall not be hurt." I did not look after it as sharply then as I should now, and instead of having 10 per cent. I had 12½ taken off, and that was not the exception, that was the rule before we had a union.

9065. In the event of your having a greater reduction than you thought requisite, you had the option of leaving your employment I suppose?—Yes. It was employers failing to carry out the established custom of the trade in September 1863, which was that we should receive 10 per cent. advance to every rise on the puddler of 1*s.* a ton, that induced us to combine to enforce payment, and after a many stoppages we succeeded in carrying our point throughout the trade.

9066. Are you aware that the demand for plate iron has very materially fallen off in South Staffordshire as well as in North Staffordshire?—I know it has, because it was so much in demand a few years ago. I take it for granted that it is a tolerably good trade when many get into it. A good many got into the trade, and the trade certainly has outgrown itself.

9067. One half of the plate manufacturers in South Staffordshire, as well as in North Staffordshire, have nothing to do?—Yes.

9068. So that an ironmaster finds it necessary to reduce the cost of rolling plates to the lowest possible minimum?—I can hardly go with that idea of reducing it. I have been in a little business myself for some years before we had an association, and if I was to go to a man I employed in my business and say, "That a certain article which you made me has sold "for 5*s.* less than I expected, and you must have "less wages," he would look at me with eyes wide "open, and justly so too.

9069. Is it not a fact that one-half of the plate mills in South Staffordshire and North Staffordshire are standing for want of demand for plates?—Yes.

9070. That the price is entirely unremunerative, and that it is incumbent upon the ironmasters to reduce the cost of rolling plates to the lowest possible cost he can. If what you have just said is true then the wisest thing for masters to do would be to reduce their make to the lowest possible point?—There is a good deal in the reduction open to remark. I stated to Mr. Walter Williams a few months ago, that the masters go to their quarterly meetings and engage to sell at a certain price, and many of them before they get to the end of New Street from the Exchange violate the very contract they have engaged to keep,

Mr. W. Garner.
21 Nov. 1867.

and as long as they do that I undertake to say underselling will go on.

9071. There is no union then on the part of the masters?—There is a union, because I know this, that in reference to the hoop iron referred to by Mr. Hobson, the last time but one that Mr. Williams sent for me, he said something in reference to unions, and he was talking about different prices that were paid, and I said, "Well, if I had my money out of my business I "should invest it in the iron trade very soon, and "I would pay a better price by 6*d.* per ton for "puddling than any ironmaster for the same quality "of iron, because I would have the pick of the men, "and I would get far more out of the men in that "way."

9072. If you were to pay your picked men 6*d.* a ton more, would not the unpicked men soon require the same amount?—Well, he said, "We dare not do that because our association would not allow us;" so that I infer from that that there is an association or union among the masters also; "If I look back for "a few months I can recollect the subject of the hoop "iron coming up at Lord Ward's and Brown and "Freer's, and the masters at their quarterly meeting "ordering them at once to discontinue paying the "6*d.* per ton."

9073. So that the grievance you have to complain of chiefly is this: You admit that there is a great deficiency of demand for plate iron, that one-half of of the plate mills in South Staffordshire and in North Staffordshire are standing, that thereupon the masters require to reduce the cost of rolling plate to the lowest amount they possibly can, and that you consider a grievance to the plate rollers?—If the masters alter prices when no reduction in iron takes place, this I call a great grievance, and one which will always be looked at very gravely, and masters must not complain if men demand an advance when there is no advance on iron.

9074. Would not the master hold on the old wages of the plate rollers in the hope that prices might improve, and not disturb the existing relations?—There are some gentlemen in the trade who, I believe, would, but there are a great many to whom I would not give credit for so much consideration.

9075. That is to say, you would not give credit to some men in the trade for so large liberality as you would to others?—I would not say for liberality, but for doing right.

9076. The ironmaster might not adopt your notions of right. The fact still remains that there is a deficient demand for plate iron, that there is a suspension of the mills in South and North Staffordshire, and that it is incumbent upon the ironmaster to reduce the expense of plate rolling to the lowest possible amount?—I do not consider that it was incumbent upon the company there to take that money off that man or any other unless there is a general reduction.

9077. Are there any other prominent grievances connected with the department of the millmen?—Only on Monday morning last I met with a case at Bilston. The class of iron for which there is now a great cry is principally for galvanizing sheets, and a large number of mills are employed upon it. When the iron is not of a quality sufficiently good, there are little black specks in the sheets, and the pickle used in the galvanizing would eat holes through it. Now that is no fault of the man, the man does his duty to the iron, just as much as if it were the best iron that was ever sent out, and yet these masters do not want to pay the men for them, and they let them lie down there, as a man was telling me, one month after another (some of them have been lying there for nine months now) and sometimes they take a truck load off and the man gets nothing for it.

9078. I want to ask you what is generally applicable to the iron trade, this is a particular work, making a particular article and not generally speaking with the iron trade?—I should think that the great proportion of the work done round Bilston, Wolverhampton, West Bromwich, and Birmingham has been for galvanizing iron during this last three or four years, so that so far as these localities are concerned, I say this is the general trade.

9079. (*Mr. Roebuck.*) Do not the men when they engage to make these plates engage to do it for a certain sum?—They do.

9080. There is a contract between them and their employers, and they have performed that contract?—Yes.

9081. Would not the law compel their employers to pay them?—The plates are thrown down, and when they get the order for them they say, "You shall have the money," but every now and then a truck load is taken away and they get no money for that.

9082. Did you ever try to enforce the payment of that amount?—What would be the result? Supposing this man were to pull the master up for non-payment, that would appear in the public papers, and I would not like to stand in the shoes of that man when seeking for work in another situation.

9083. When Saturday night comes round and you have made the plates which you engage to make, could you not enforce the payment of that contract?—I have never seen it tried, and they do not weigh them, so that you could not tell the amount for which you would have to sue.

9084. Then I would advise you to try it?—If a man were to do so he would be a victim.

9085. You assume that?—I need not assume it, because there are plenty of men in the country that are out of a situation, and simply because they are union men masters will not employ them, and in fact at the very same works to which I referred in North Staffordshire they are carrying it out as rigidly as it is possible for masters to carry it out at the present time.

9086. You cannot say that the law would not enforce that contract?—I do not say that the law would not, but then the man would be the sufferer afterwards if he enforced it.

9087. (*Earl of Lichfield.*) Would not your union do anything in that case for the man who was victimized?—I will suppose that one of our men was down there, for instance, and wrote to ask what he was to do. The association would be quite willing to have him on the funds if he chose to accept union pay; but rather than accept this, men often prefer to suffer the wrong at works where we have not sufficient power to enforce fulfilment of contract. When a man applies for a situation he is asked if he is a union man; if he is, he is told they cannot employ him, and all who are employed at some works in North Staffordshire are compelled to pay secretly, under penalty of being discharged if it should be known.

9088. Did your association take any part in the North Staffordshire strike?—It did.

9089. What part?—The part which we took in the North Staffordshire affair was this: Looking at the aspect of the trade in the country we decided to accept the terms a day or two after the expiration of the notice for the reduction, and every man in our association was bound by that. In North Staffordshire as well as in other places where they had iron to work they had to carry out the resolution which we had come to. We were waited upon by men representing the other associations who wished us to reconsider our decision, but we would not; we carried it out rigidly. But to all those men who were at play through not having iron to work we allowed three-fourths of the amount which they would have had if they had been on strike. We did not consider our men on strike. I daresay Mr. Mathews saw the address that we sent to the employers when the lock-out ceased. We stated that we had supported them, and that so long as they were suffering as they were we intended to render them all the assistance we could during the time that they were out. We had nothing to do with the strike at all.

9090. In short, the millmen had nothing to do with the strike, but they were thrown out of employment in consequence of the puddlers striking?—Yes;

although they were willing to take the reduction, the masters treated them as though they too were men on strike, and unfortunately the masters at certain works which I could name, treated them more harshly than they did the men who were on strike.

9091. I suppose that if the puddlers did not choose to work there was nothing for the millmen to do?—In some places they got iron. They worked at what iron they got in North Staffordshire, and if they had worked one week and had not worked the other, then we supported them during the time that they were at play; and if the masters could get iron to go on a day or two in the week of course they would, and until such time as the thing was ended we allowed them the support.

9092. At any rate the strike there was not approved of by your association?—No.

9093. (*Mr. Mathews.*) When the puddlers consented to go to work, was it not the fact that the millmen stood out?—It was the fact that all the ironmasters during that strike and lock-out tried to bring all the men who were a little higher than Earl Granville's and Kidsgrove down to their level, and I think I wrote to every office about it twice, stating that we should not submit to it.

9094. Was it not the fact that the prices throughout all the works in North Staffordshire were thoroughly uniform?—No, they were not.

9095. You and I may have a different opinion on that point?—To show the Commission in general that it was not so, I may say that they tried twice ineffectually to reduce the very men who had accepted the reduction, during the strike and at the termination of the lock-out, to the minimum. I have seen printed lists of it sent to me by the employers, and when the masters wanted them to begin after the strike ended, the millmen employed at Earl Granville's and at the Silverdale Company's works said to their masters, "We were quite satisfied with our prices, and did not trouble about what other masters in the district were paying their men, until you tried unsuccessfully to bring all above us down to our level, now we think it only right and just that we should be put on a level with them." Mr. Naylor, cashier at the Silverdale Company's works, at once said he would make his men equal to those above them, and did it. Mr. Roden, managing partner at Earl Granville's, gave his men a verbal guarantee to the same effect, but failed to fulfil it when the first pay day came, and the men only had a draw. As soon as pay day was passed Mr. Roden goes out for a month, the men would have stopped at once until he had made good his promise, but the union requested them to keep the works going until his return. They did, and on his return they saw him about fulfilling his engagement, he said, "Can't you take my word. I tell you nobody in the "district shall have more than you." But instead of making good his promise, when pay day came he had been round the district, and got all the other masters to give their men notice to come down to his prices. The men refused to begin again until he made good his promise. The union sanctioned this step, then he got his men together, and gave them only part of what he had promised.

9096. Are you aware that the North Staffordshire ironmasters met and came to a decision for a uniformity of price?—I suppose they did, or else they would not have drawn up those prices.

9097. There was a perfectly uniform rate of prices established at the North Staffordshire ironworks; they were all alike?—No, they wanted to establish a uniform rate, but to take the lowest as the uniform rate, and as I said above, we would not allow them.

9098. Are you aware that they did what I have stated?—No, because Mr. Naylor brought his men up to the Ravensdale price. Captain Roden promised to do it, and after the first fortnight he let the men draw. The men were persuaded to go on and not stop the works, while he was away from home, and when he came home they waited upon him. He said, "Cannot you take my word." The men were dissatisfied, and when they left off work one Saturday they would not work again until he fulfilled his promise.

9099. What can a good plate roller get?—It is according to the mill and the orders.

9100. Take an ordinary mill?—I know that in some places they get a good deal, and in some places they get less. If I take what Mr. Jones and somebody else published from the northern district some time ago, they get an enormous sum, and I have said more than once since in reference to what it was said that the men got both in North Staffordshire, and in the North of England, that I only wish the employers were compelled to pay men what they said they paid them there.

9101. It is a skilled department of labour?—It is.

9102. It is not an uncommon thing for a head roller to get 10*l.* a week, is it?—A good one may get that, and he would be a cheaper man to the employer at that rate than one that is an inferior man who works for 4*l.* a week.

9103. (*Mr. Harrison.*) Are there any deductions out of that?—That man may get 10*l.* a week one week, but from bad orders and accidents over which the man has no control perhaps the next week he will not get a third of 10*l.* But it appears to me that if sometimes there are extraordinary orders and things go on very straight, yet from the casualties that there are in the iron trade no man who does not understand it is able to go into it. No; the next week that man through bad orders, or things over which he has no control in reference to the machinery, or the iron being of an inferior quality, perhaps, will not get a quarter of 10*l.*

9104. (*Mr. Roebuck.*) You say that the man who receives 10*l.* a week is better worth his money than the man who receives 4*l.*?—Yes, if he is a practical man.

9105. Do not you think that it is a bad rule to equalize those rates of wages?—We have not done so.

9106. Do not you think that the attempt to do so would be an injustice?—I should say that it would be an injustice to the man in some instances, and to the master in other instances.

9107. Therefore if there is any mode by which wages can be equalized it is really an injustice to the men themselves?—In some instances it would be an injustice to the men, in other instances it would be an injustice to the employer.

9108. Now I come to put another question to you. If there are any trades unions which so regulate their transactions that they equalize, or endeavour to equalize, wages for the bad workman and good workman, that is an injustice to the good workman?—It would be an injustice in one instance to the man, and in another instance to the master.

9109. You do not see what I have put to you. If there be trades unions whose transactions are regulated so to assimilate the wages of the inferior men to the wages of the superior men, those trades unions do an injustice to their trade?—My opinion is that they do.

9110. (*Mr. Harrison.*) Do you know if there are any trades unions which ever attempted to do such a thing?—No, I do not.

9111. Did you ever know a trades union which fixed a maximum wage?—I do not know of anyone.

9112. Is not the Ironmasters' Association, in fixing a maximum price, doing precisely that which the question which was just put to you involves? I allude to an answer which you just now gave to the effect that certain works advanced wages, and the Ironmasters' Association put pressure upon those firms, and induced them not to do so; and I ask whether in so doing they were not pursuing precisely the same line of conduct which you have just now in your answer told us you consider unjust?—Exactly so. I said in my answer that there may be trades where a regular rate of wages would be possible, but that it was impossible in the iron trade.

9113. (*Chairman.*) I do not understand particularly what action your association takes in supporting the

Mr. W. Garner.
21 Nov. 1867.

men, except having a reserved fund which the men may fall back upon if they think that they have grievance enough to stop work. You have no benefit society ?—No, we failed to establish one as I stated.

9114. If the men are out of work your funds are available to support them, I suppose ?—No, not if they are out of work, simply for want of employment. If they are being oppressed then we support them.

9115. It is only in case the men are ill-used, and are in your judgment out of employment by the fault of the employers ?—Yes.

9116. And I do not understand that your association has any other action than that. It is a fund upon which the workman may fall back for support if he thinks that he has been ill-used ?—Not if he thinks that he has been ill-used. There is never any case of dispute that comes before our executive unless we have both sides of the question, the master's and the man's, before we decide upon it, and then if we find that the man is being oppressed we support him. And I may say this in reference to our committee thata more impartial body of men I have never known.

9117. (*Sir D. Gooch.*) As your millmen are paid by the ton, I suppose that the difference between the good workman and the bad workman means this, that the good man can turn out a greater weight of iron than the bad man ?—Yes, he will not make as much waste. In plate mills and sheet mills there are great casualties, and careless men might lose 50 or 60 or 100 pounds a week, and of course a man who is skilled will get more out in the time with less risk.

9118. And therefore is deserving of a much higher pay ?—Yes.

9119. Is not it the case that it is not only beneficial to the men but a great advantage to the master to be able to turn 300 tons out of his mill instead of turning out 200 tons in a given time ?—Yes.

9120. Therefore it is an advantage to the master to have the best class of workmen that he can get ?—Yes.

9121. And do not you think that it is a very important thing that the man should be able by his greater skill to earn a much higher rate of pay than an inferior man, and provide for himself and family better ?—Good men have that opportunity, we do not hinder them.

9122. You would not wish to see the working classes put in a position whereby that man who you say would earn only 4*l.* a week because he is not skilled put on a level with a man who can earn 10*l.* because he is skilled, or would you wish to see such a system as that established among the working classes ?—I would not; but in our trade, since I have been in it, masters have come to us (and I know that that has been the practice in many places in the country) and said, "Now get so much a fortnight out "and we will give you a feast, or we will give you so "much money. I like to see you have a good handful "of money on the Saturday night, for the more you "get the more we get." We have done it and have worked harder than any men ought to do, and in a month or two after that the masters have used the very same argument as a reason why they should reduce us, and have reduced us when there was no reduction on iron.

9123. The iron trade is a trade of piecework from beginning to end pretty nearly ?—It is.

9124. Do you see any objection to the principle of piecework ?—No, I see no objection to it if they will do right with us.

9125. (*Mr. Merivale.*) What is the reason why piecework only has prevailed in your business, and you have never got to wages in the ordinary way ?—I do not know that ever such a thing has been offered.

9126. It was always the custom of the trade ?—Yes, the idea of the iron trade is now "That is the man for me who gets the most out."

9127. (*Earl of Lichfield.*) But the addition of wages earned in that way refers to quantity more than quality, whereas it appears to me that quality has more to do with it in the case of rolling these plates which you have referred to. Now what I want to know is this, do I rightly understand you to say that the masters, under regulations made by them, fix a maximum rate of wages for that description of work ?—I suppose that there are scarcely two mills in the country (at least I do not know two works) where the prices are exactly the same for mill work. In fact, if I go to Mr. Foster's works the prices for one thing at his works at Stourbridge would be different from the prices at his works at Brierley Hill, and the British Iron Company's prices are different in works only three miles distant from each other.

9128. There is not a maximum rate of wages fixed by the masters or men for that particular work ?—There is not.

9129. (*Mr. Merivale.*) I understood you to say that the masters' association fixed prices ?—I spoke then in reference to puddling the hoop iron.

9130. I see that your rules specify clearly the benefits in one case, which you have described as a "case of oppression." In that case the first class are to receive 1*l.*, the second 15*s.*, the third 10*s.* Are those classes merely according to the rate of their subscription ?—Yes. The amount paid out is now altered to 15*s.* and 7*s.* 6*d.*

9131. There are only two classes, you mean ?—Only two.

9132. But those classes are paid according to the amount of their subscription, the first and second class means that ?—Yes.

9133. You do not reserve to your officers and committee to decide how much you will give a man ?—No; what he subscribes for he has.

9134. (*Mr. Roebuck.*) There is no first and second class oppression ?—No. A skilled man in the trade gets good wages, but another in the trade may only get 3*s.* a day, and he cannot afford to subscribe as much as the other. That is the reason of those two classes.

9135. (*Earl of Lichfield.*) I see this in one of your rules, "If any dispute arise between puddlers "and their employers respecting their wages, the "executive committee of this association shall meet "the executive of the Puddlers Association if con-"sidered necessary, and if after their united delibe-"rations it be deemed advisable and will best serve "the interests of the trade for millmen to cease work "with the puddlers, it shall be so." I suppose that at the time of the North Staffordshire strike you had an interview with the puddlers ?—No, we had not.

9136. Not under that rule ?—No.

9137. How is that ?—In fact we have never had that rule carried out since we have had an association,

9138. Then you did not act upon that rule in the case of the North Staffordshire strike ?—We could not from the course we took. We decided to accept the reduction, and all our men had to carry out the decision, and we had no interview at all. I told you before that after the strike had been going on in North Staffordshire some weeks, Mr. Kane and another came and waited on us, and wanted us to reconsider the decision which we had arrived at in reference to accepting the reduction, but our committee said, No.

9139. According to your rules it is provided that in the case of a dispute between puddlers and their employers you shall go into the merits of the question with them, and decide upon that whether you will join with them. That you did not do on that occasion ?—If the puddlers had come to us and requested it we should have done so, but they did not.

9140. (*Mr. Mathews.*) You say that Mr. Kane came down to ask you to reconsider your decision ?—Yes.

9141. You did not follow Mr. Kane's advice ?—No.

9142. With reference to piecework, a good boiler plate roller employs several men under him ?—He does.

9143. And he employs just the sort of people that will work with most advantage in conjunction with himself. There is no limit placed on the amount of wages that a boiler plate roller can get under such

circumstances, but he gets as much as he can get out of the men?—If the under men are members of our association their interests would be looked after as closely from the head man, although a member of our own association, as his would be looked after from his employer.

9144. A bad boiler plate roller can get nothing like a good boiler plate roller. There is no limit placed upon the extent of the man's get; but the bad workmen and the good workmen are left to find their own level with respect to their capacity?—Quite so, we leave that entirely in the master's hands, if he likes to employ bad workmen.

9145. (*Lord Elcho.*) You have said that the managers are appointed, not as being the most competent men, but as being able to screw the greatest amount out of the labourer?—As a rule.

9146. You deliberately say that as a rule that is the reason for their appointment, not their fitness to manage the concern, but the fact that they are the best screwers of labour?—I will mention a case in the locality of West Bromwich. The manager of certain works there said to me, "I always like to keep my "puddlers at variance with each other, if I can do "that I can make them do anything." That is a statement from a manager who is living within 10 minutes walk of my house.

9147. (*Chairman.*) Have you lived long enough to know that the men who profess very fairly are for the most part the worst to deal with, and that a man who can speak out like that is the best to deal with?—I do not take it only from what the man said, but I take it from the actions of the man.

9148. If he did do it, that is another thing of course?—And I know that they do it. It would not be the mere statements that a man made that would influence me, I shall make no statement here that I am not prepared to prove if required.

9149. (*Mr. Harrison.*) With regard to that question of the forfeits about which you spoke early in your examination, I should like you to make it a little clearer, for I do not know that I quite follow you. Do you mean that there is anything like a practice or that you know frequent instances in which work which has been contracted for and done with, which is defective from the badness of the material, and not through the fault of the millman who has worked it, has not been paid for at all, but has been wholly forfeited?—Yes, in some instances. I went twice to see some work, at the Atlas Works, West Bromwich, a few weeks ago. This iron had been examined and passed as perfect (and paid for) before leaving the works; but being of inferior quality—holes dropped in while going through the galvanizing process—it was sent back, when the master stopped all the money for what came back. In the last instance the union insisted on payment, and he complied after a few days play.

9150. That is a case where the goods when manufactured are not marketable at all, but are worthless for that purpose. But now take this case, the iron which was being manufactured is not fit for, or does not measure to the exact required purpose, but is itself sound and is marketable for another purpose, or at a lower price for instance. Have you known such cases in which total forfeiture of the wages of the man who made that has followed?—Yes, plenty of iron that is not marketable for that, but goes off for bad or waste sheets.

9151. And is actually sold in the market?—Is actually sold at a lower rate.

9152. Do you mean that the labour by which that was made would not be paid for at all?—Not paid for in the mill department.

9153. You mean in point of fact this, that the system of forfeit of which you have been complaining is not a proportional forfeit in accordance with the amount of damage, or the amount of the inferior work, but is a total forfeit?—It is a total forfeit for the quantity which do not cut the length and breadth.

9154. It is a total forfeit for that work although the article itself goes into the market, and sells for something?—Yes. In some of the works they pay half price for what they call waste sheets for washer iron and other purposes.

9155. (*Mr. Roebuck.*) When they discover that a man has been so wrongly treated, has the union stepped in and protected that man?—Quite so. We at once go and see the employer about it. In some instances we succeed in getting the employer to allow what others allow, in others we do not succeed. If the man fails to agree with the employer, he leaves his situation, and we support him till he finds another.

9156. (*Mr. Mathews.*) Has not the man his remedy to recover his wages before a magistrate?—What man on earth who has a family depending on him will run the risk of having to walk about through the country to look for a situation if he pulls an employer up, and you know as well as any man that such would be the case if he did.

9157. (*Mr. Harrison.*) Have you known instances where this has been one of the grounds of dispute in case of strike?—I do not know that it has. In most cases we succeed with the employer. We show to him the reasonableness of giving what the majority of employers give, but in some instances the men will not leave their situations on that account if we do not succeed.

9158. Was not this particular grievance a good deal discussed and spoken of in the case of the Low Moor strike in 1864?—I cannot say anything about the Low Moor strike any further than this, that when that document was sent to us we sent them something.

9159. Will you state what the document is of which you are speaking?—I cannot, it is such a lengthy one; it is half as large as the door.

9160. Will you state the object of it?—It was a document in reference to not being connected with an association. We were in no way connected with the thing further than this, that we sent them 50*l.* a week, unsolicited, for 17 weeks.

9161. Will you tell us the object of signing the document?—For the men to have nothing further to do with a trades association, and that is what they are obliged to promise to do at the work I refer to in North Staffordshire at the present time.

9162. (*Mr. Roebuck.*) By whom was the document issued?—By the masters, and it was put up at the works.

9163. (*Mr. Harrison.*) Is that it (*handing a document to the witness*)?—Yes.

9164. You cannot tell us anything about the Low Moor strike in 1864?—No, not any further than what I have just stated.

9165. (*Chairman.*) Is there any other matter which you think it would be important for us to know?—I would just say this in reference to a thing you were questioning Mr. Hobson about, namely, the truck system at ————, where they tried to evade the law. I have some of those notes in my possession at home. They have different prices for iron according to certain classes that they do, and that is put down there as so much iron, but no money is put to it; so much iron of one class, and so much of another class, but no money is put on the note. The note is put into the man's hand, he does not know what he has to receive, and he cannot tell whether his money is paid right or not.

9166. (*Sir D. Gooch.*) What are those notes for, are they notes to take to the shop?—No, the man gets his money for them. There have been several actions against the proprietor of that work lately. I think that some gentleman on the Commission referred to that, and in order to evade the law laying hold of them they put on the notes just so much iron. Suppose I work so much iron at 5*s.* a ton, so much at 3*s.* 6*d.*, or whatever the rate may be, there are 20 tons say on the note, and no price put to it, 10 tons and no price put to it, 50 tons and no price put to it, nor is there so much as the sum total on the bottom of the note, so that I cannot see what money I have to pick up at the office.

Mr. W. Garner.
21 Nov. 1867.

9167. (*Mr. Roebuck.*) Could you not work out the sum yourself?—Yes, I could, but where there is one working man that can do that there are 50 that cannot, and I cannot tell whether they will take my statement on oath, when I say that I have been paid 1*l.* short; I have been paid even 1*l.* too much.

9168. (*Sir D. Gooch.*) What is the object of this? I do not see how it is connected with a truck shop?—The men complain about it, and they have the notes, but not monied.

9169. How do you connect that note, which is a pay-table note, with the truck system? If the man took that note to the truck shop and they gave him groceries upon that note I could understand it then?—They have had a deal of trouble lately about it. I cannot put that note in to say what I have received at a certain time. They have the truck shop there, there is no doubt of it. Supposing that an employer gave me a note with no money stated on it, and I walk off home with it before I put any money down on the note, would my statement as to what was owing to me be received as evidence? I have recommended the men to do this, to put down at once what the amount is, and I would never stir from the pay window till I had put down the amount.

9170. What does the master get by that?—Until lately they always had the notes monied, as follows, 20 tons at 3*s.* 6*d.* or 20 tons at 5*s.* 6*d.*, and so on. They ought to be stated here with the price, and what it comes to altogether, but they do not put the money on in any form whatever.

9171. (*Earl of Lichfield.*) In plain words, I suppose you mean that the intention of the masters is to defraud the men of part of their wages?—I do not mean that to be inferred.

9172. (*Mr. Roebuck.*) Supposing that upon that pay-note you have 20 tons at 5*s.* 6*d.*, that will be a note which you could present to anybody, and he, if he knew how to make the calculation, would know what was owing to you?—Yes.

9173. And as of course any person who is educated would know what was owing to you, would not that be evidence in a court of justice of what was really owing to you?—Yes; but who is to prove that what I say I received is correct? Would they take that as evidence? I go and swear that I received 10*l.* or 20*l.*, as the case may be, but there is no money down there.

9174. (*Sir D. Gooch.*) Are there any deductions made for groceries at the office from the amount due to the ironworker?—Not that I am aware of.

9175. (*Mr. Harrison.*) Do they receive money for the notes at the pay office?—They receive money.

9176. What can be the object of the notes?—I cannot see, unless it is to evade the Truck Act, because up to the time they had these trials in reference to the Truck Act they monied their notes.

9177. (*Lord Elcho.*) You are not aware of men receiving that money with any deductions for things received at the truck shop?—No, but certainly the men are very dissatisfied with it.

9178. (*Mr. Booth.*) Can you suggest how making out the note in that way enables them to evade the law?—I cannot, but I cannot see any other reason, because they always monied the notes previously.

9179. How do you connect it with the truck system?—I say that I cannot see what other object they have in view, because they always had them monied up to the last few months.

9180. (*Earl of Lichfield.*) What grounds have the men for being dissatisfied with that mode of making out the accounts; do they find that in any instance they have received less money than they ought to have done?—I have not heard that they have, but among the lot of men who cannot calculate it is rather a difficult thing for them to make it out.*

9181. (*Mr. Harrison.*) You told us that you have known men receiving 10*l.* a week, do you mean that on the average it comes out 500*l.* a year?—If a man gets 10*l.* a week for one week, as I said before, the next week he may not get a quarter of 10*l.*

9182. Supposing you take your own recollection of a good year, how much do you suppose it would come out at the end of a fair year?—My opinion in reference to the iron trade is that 10 days a fortnight we consider good work when we go on regularly. If you take a third out of that for stock-taking, breakages, and other things over which the man has no control, I think you have pretty nearly an average of what ironworkers do in good times.

9183. (*Mr. Roebuck.*) Did you ever know a man at this work make 500*l.* a year?—No.

9184. Did ou every know a man make 400*l.* a year?—No, I do not know a man that ever kept an account.

9185. You say you do not know anybody who ever made 500*l.* a year in that class of work, do you also say that you never knew a man who made 400*l.* a year?—I may know the man, but I do not know that he has made it

9186. You will not say that a man in that class of work does not make sometimes 400*l.* a year in some good years?—They may in some extraordinary cases, but I question whether there is any man in the country who does.

9187. Did you ever know a man who made 300*l.* a year?—I cannot speak positively, there may be some.

9188. Do you think it very possible that they sometimes make 300*l.* a year?—If there is a case it is a man that has got a large contract, and a large number of men under him that work for him.

9189. And a good workman?—Yes, he must be.

9190. But you think it quite possible that a good workman may make 300*l.* a year?—It is possible that he may in an instance like that, but they must find him constant work and good material, and be certain to warrant him going on at work without any stoppage.

9191. (*Mr. Mathews.*) Do you mean that a plate mill in ordinary times does not work more than two-thirds of its time?—Very seldom.

9192. If I were to tell you that I know, from my experience, plate makers who have got 600*l.* a year, should you believe it?—I should not disbelieve it, or anything that you or any other gentleman may say, unless I had facts to bear me out.

9193. (*Mr. Harrison.*) Do you know anything about the prices that are paid for a similar class of things in foreign work; have any of your men been abroad and come back with information of that kind?—There is one that is working for Mr. Thornicroft, of Wolverhampton, now. I had some talk with him when these matters were being raised, and he said, "One Englishman does as much in a day as two foreigners. There is no doubt about that." I have never been abroad myself.

9194. Your society has never adopted any organized means to promote emigration among its members?—It has not.

* The witness subsequently forwarded the following statement:—"Two convictions were obtained last year against —— under the Truck Act. . . . . Before the above-mentioned convictions they got their orders for truck in the following manner. The manager, contractor, or chartermaster gave the men employed by them a note with the amount on it they required (if they had earned it): this was taken to the pay office, where it was changed for a kind of greenback; they took this to the shop (which is only a few feet from the pay office), and the goods were supplied. When pay day came, each man was furnished with a pay ticket, containing the amount of iron done, with the rate of the various sizes, and the amount earned opposite each size, and the total, out of which in plain figures the draw or stoppages were made. Since these convictions they have adopted the following mode. Twice a week an under clerk goes round with a book to each man in which he enters his name, and asks him what he must put down to his name. This book is taken to the pay office the following day they go to the office, when the sums opposite their names are paid (in cash), which they have to spend in the shop; when pay day comes they are supplied with a note with nothing on but the man's name, date, and the tons of iron done. There is no rate, nor any money at all, nor any stoppage, although they are all made, hence the man has nothing to show that any stoppage has been made, and this is how the law is evaded by them."

The witness withdrew.

Mr. JOHN MILLINGTON examined.

Mr. J. Millington.

21 Nov. 1867

9195. (*Chairman.*) I think you are the secretary of the National Association of Malleable Iron Workers?—Yes.

9196. Is that the same association as Mr. Kane belongs to?—Yes.

9197. (*Mr. Mathews.*) Where do you reside, is it at Gateshead?—At Walsall now; it was recently at Gateshead.

9198. Are you an assistant of Mr. Kane's?—I am secretary, and Mr. Kane is president.

9199. Is yours a paid office?—Yes.

9200. What do they pay you as secretary?—120*l.* a year.

9201. Were you present while Mr. Kane was being examined?—Yes.

9202. Then I think it is not quite necessary on my part to go through an examination again of the same nature as that which Mr. Kane underwent. Do you generally concur in the answers which Mr. Kane gave to my questions?—Yes.

9203. You generally concur in the evidence that Mr. Kane gave?—Yes.

9204. (*Chairman.*) Do you wish to add anything that Mr. Kane did not tell us, and which you think would be material for us to know?—I wish to add a little. I may say something with regard to the custom of the employers in the North of England stopping millmen's wages for short rails or plates which do not cut exactly to the pattern or the order, although the fault of that shortness in the rail or width in the plate may be due to the manager who orders the cutting of the pile. For instance, if the plate is too small when rolled, the roller gets nothing for it and the furnaceman gets nothing for it. Should there be a flaw in the rails, too, when the rail is finished, it is put on one side, and the men get nothing for it, and I have known instances of 50 or 60 tons of rails being manufactured that the men have not been paid for. Instance the Weardale Iron Company.

9205. (*Earl of Lichfield.*) Did they decline to pay upon the ground that it was the fault of the workmen that the rails were deficient?—It was no fault of the workmen.

9206. (*Mr. Roebuck.*) Do they ever allege that it is the fault of the workmen?—They cannot.

9207. Do they ever allege it?—Not that I know of.

9208. (*Mr. Merivale.*) You all working by piece-work, is it not part of the piece-work system, and understood to be so, that bad work goes for nothing, and that the workman takes his chance of losing it?—So the employers say, but that is not generally agreed upon with the workmen that they should be responsible for the bad work when it is not their fault.

9209. (*Mr. Mathews.*) Do the Weardale Iron Company pursue a different practice in reference to that from the rest of the Middlesborough district?—No.

9210. It is the fault of the man who makes the piles, I suppose?—Notwithstanding that, the rollers get nothing for it.

9211. Notwithstanding the fact that the man who makes the piles makes a pile too light, and thereupon the rail is too short, is the price of the rolling deducted from the rollers?—Yes, and the furnaceman's price too.

9212. But if the roller were to sue the employer for the amount of his wages, and were to show the magistrate that it was no fault of his that it was too short, would he not be able to recover it?—I should think he would, but the consequence would be that the man would be victimised by the employers.

9213. You have a suspicion of that sort?—I have proof of which I can furnish examples.

9214. It has come within your experience, you mean?—Yes.

9215. (*Mr. Booth.*) Have you found that the existence of the unions has had the effect of correcting that grievance?—In some instances, or to some extent; they have not yet been able to remove it wholly.

9216. But you think that they have been instrumental in diminishing what you call the hardships of the men in that respect?—I do.

9217. How have they done that?—By deputations appointed to wait upon the masters, and conferring with them upon the question.

9218. (*Sir D. Gooch.*) The weight of the piles for the rails could not be the fault of the pile maker, I presume, because piles are made from bars of a certain length pretty nearly prepared beforehand, and he cannot make the bars of a different length?—Upon an order coming into the mill, of course the weight of the pile is calculated, and there are times when managers or foremen make a mistake in ordering the weight of the piles. I have known the piles too light, and the rails therefore too short, and the men have got nothing for them; in fact several of the employers in the North of England have a system of stopping certain amounts of wages from the men per week or fortnight for what they are pleased to term bad work, while the defects in the rejected plates or rails are directly traceable to the bad quality of the material from which such rails or plates are manufactured.

The witness withdrew.

Mr. JOHN KANE further examined.

Mr. J. Kane.

9219. (*Chairman.*) I believe you wish to make some statement to the Commission?—I should like to make a statement of some facts which have come under my own observation, and which I have had something to do with by way of arranging matters. There was one case in which 400 tons of rails were stopped from the men employed by Mr. ——
These rails, which had passed the inspectors, were, I understand, sent from the works. The rails were ultimately returned again, and the men were charged to pay back the money which they had received for these rails at the rate of 5 per cent. Now if the rails were defective, it was owing to the quality of the iron from which the rails were manufactured. Large quantities of old rails are used by the firm with puddled iron in the manufacture of new rails.

9220. (*Mr Roebuck.*) That is a broad assumption of the case?—I know it from being a practical workman, and interested in the case myself, and having gone there by a request of Mr. —— and the workmen. We succeeded at last in arranging it in this way, that 250 tons should be stopped of the men, that in future all rails that should pass the saws were to be paid for as good, and that $2\frac{1}{2}$ per cent. was to be deducted from the entire wages of the men in the rail mill to meet any unforeseen casualty of that kind which might necessarily follow, as far as arranging with the contractors and inspectors was concerned. Now that system worked very well as long as it was in operation, until the men commenced work again, and now I understand it is swept away. Though the men have been working according to the arrangement with the employer, they are made responsible for the quality of the iron as well as the rails. There is another case which I can mention, but I will simply state that as far as Lowmoor is concerned, the stoppages were very serious indeed. I am quite prepared to take the responsibility of producing witnesses if necessary to substantiate my statements. I have several other facts before me which I am prepared to lay before this Commission, of parties being charged from 1*s.* to 1*l.* in the week in stoppages from wages due.

9221. (*Mr. Booth.*) Is it your experience that these occasions, complained of on the part of the men arising from an allegation of imperfect work, are more or less frequent now than they were before the institution of trades unions?—They have been more

Mr. J. Kane.
21 Nov. 1867.

frequent during this last 12 months than I have known them, that is to say, since the termination of the last dispute.

9222. They were less frequent before the establishment of the unions?—I will not say that they were less frequent before the establishment of the unions for the conduct of the firm of Messrs. ——— was the chief cause of the formation of the union at Darlington. But since the termination of the last dispute at the commencement of the last year, the fining process and the other things which I have named have been more extensive under that firm than they were before.

9223. Do you think that the establishment of the unions has been instrumental in diminishing that cause of complaint on the part of the working men?—Yes, and I am quite prepared to prove that it has enabled the men to remove many grievances.

9224. (*Mr. Hughes.*) Do you mean that in these shops to which you are alluding, there are no regulations put forth on the part of the masters, stating that there will be fines?—No, I do not say that, because on the opposite side of the pay-notes it is to be found, but I have yet to learn that those employers' rules override an Act of Parliament.

9225. Is it the case that the men have the remedy in their own hands?—They may have the knowledge, but they frequently want the means of acting upon it.

9226. (*Sir D. Gooch.*) For any large establishment there must be some code of rules, must there not?—Yes.

9227. Both in the interest of the master, and in the interest of the men, there are certain fines for certain offences, and of course if a man who has come under one of those demands has money, he ceases to be a member of the establishment?—The modern system is this, that a man has to accept what is given to him, asking no questions and holding his tongue; to question the right of some employers, is to ask for your dismissal.

9228. (*Chairman.*) In these cases of fines, if I understand you right, the fine levied is put on the pay-notes, according to the avowed practice of the firm?—All fines are placed on the pay-note, each pay-note stating, "fines so much." Hence it is deducted off the pay. There is one case which I know, and it is now in the hands of a lawyer, where a man was fined 1*l.*, and all he was to receive was 18*s.* 3*d.* for work performed, one-third of the amount belonged to the helper. This man had to borrow money to pay the amount due to the under hand, and want himself.

(*Mr Jones.*) Perhaps I may be allowed to offer one word of explanation on this point. I understand that this dispute to which Mr. Kane has referred, arose before the long strike which took place in the North of England last year, and I understand Mr. Kane to refer to the fact that Mr. ——— altered the terms of payment, and that they are altered at the present time. Now the terms of notice which were put up by the employers in the North of England were, in effect, that after a certain date, all the men employed in their respective works were to consider their engagement at an end, if they did not accept certain deductions. Consequently all the men in the North in England were discharged, since they did not accept those deductions on the 14th of July, and when they began work again, they entered on quite a different arrrangement. I have no doubt that that would be the explanation given by the particular firm, though I do not know the particular case, but I just allude to the fact as showing that all the firms in the North of England had discharged all their men in the meantime.

(*Witness.*) Would you allow me to say that there is nothing in the new contract which abrogates the arrangement so far as rails passing the saws is concerned. What Mr. Jones refers to entirely depends upon the fact what price shall the men work for per ton.

9229. (*Earl of Lichfield.*) I do not understand you to say that this is the only case which you ever heard of?—No; I can supply many others. I am not prepared to say that it is the general practice. I have not the slightest desire to make it appear that the workmen are all saints, and the masters all devils; that is not my object. There are certain illegal practices that are carried out, and this fining process is certainly one of the worst. I have known men literally starving in consequence of the fining process. If it is agreeable to the Commission, I think that I shall be able to furnish the Commission on another occasion with some facts of which I have notes in my possession on which the fines are marked with pencil.

9230. (*Mr. Hughes.*) Do I rightly understand you to say that these fines are constantly inflicted for faults in the material over which the men fined could have had no control?—Yes, but I do not say that the practice is invariable.

9231. (*Mr. Mathews.*) But in the case of examination into these fines, if the men can show to the masters that it is really no fault of theirs, but that they have done their duty, do you mean that the masters then persist in inflicting the fines?—I mean that the masters are frequently imposed upon by the managers, and that the manager is the party that fixes the fine, and the employers profit by it.

9232. It is referred, I presume, to the master in the last resort? After hearing all those circumstances, would he persevere in inflicting the fine?—In some instances, where the master is a sensible man, he would not. Such a man as the late George Hawkes, or such a man as Mr. George Crawshay, of Gateshead, would be ashamed of such a thing; but some men are not intelligent men, or feeling men, and would not, I believe, think they were doing anything wrong in inflicting the fines.

9233. But the workman would be able to say in such a case, "You cannot fine me by law?"—But you are well aware that at a time when there is a depression of trade the men are compelled to put up with what under other circumstances they would not submit to.

9234. That is to say, they are compelled to adhere to the rules which the employer lays down for the man. The men know what those rules are. The employer says, "If you work for me you must work for me under these rules," and amongst the rules is this: "You shall be fined under such circumstances?"—I wish you to draw the distinction between the system of fining and stoppages; they are two different things altogether. The stoppage, so far as wages are concerned, applies to the work; the fining is for the mere violation of some of the rules at the arbitrary interpretation of the manager.

9235. One, in point of fact, is a breach of rules, the other is a breach of contract?—Yes, but such rules and contracts are often one-sided.

9236. (*Chairman.*) Have you any further statement to make?—I have no objection to stating the practice in the Leeds district, extending from Leeds down to Lowmoor. I need not say that some of the gentlemen were legislators. The practice adopted in that district is the following. The men work a specific quality of iron, it is called best iron, they work a certain number of heats per day, and each heat is broken. If they find in the breaking process that the heat breaks what is called black, they are paid a certain price for it, if it is broken white they are paid a much higher price for it, a difference of something like 3*s.* a ton. That is of course an understood arrangement between those workmen and the employer, and I attach no importance to that. But mark what follows. In the event of a man having above 28 cwt. of black iron when broken, he is not paid for it. Such was the state of things in the Leeds district up to the termination of the dispute in 1864.

9237. (*Mr. Hughes.*) I understand you to say that if a man turns out more than 28 tons of iron, and one of his heats breaks black, then he is only paid for the 28 cwt., and forfeits all above?—Yes, that is so. The chief objection is this, from the system of shingling that is carried out there, and the heating what are called the bloomes, if any of the plates should turn out

in the slightest degree defective, these plates are cast on one side, and the money of the puddlers, the furnace men, the rollers, the shearers, the shinglers for such work was stopped.

9238. (*Mr. Roebuck.*) The men go to work knowing that this is the rule?—They go to work knowing that that is the custom, not that it is the rule, for no employer would publish such a rule.

9239. Knowing that it is the custom under which they are to work?—Yes.

9240. (*Mr. Hughes.*) The whole of their wages for that work is stopped?—For that kind of work above 1 ton 8 cwt.

9241. (*Mr. Mathews.*) Does not the character of the Lowmoor iron stand higher than that of any other iron in England?—It does.

9242. Do they not take extreme care in every process of the iron manufacture?—It is all part of the custom in the district.

9243. And do not the workmen understand all that, and co-operate with the employers in any arrangements made to secure the quality of the iron?—They co-operate in all things save and except the fining process, and the men do not like that.

9244. It is known that if men have the privilege of working there, they work under that understanding?—They have the privilege of starving if they do not work.

9245. Why should they starve, are not there other places in Yorkshire besides Lowmoor?—This state of things applies to Leeds as well.

9246. This is the custom of the district in fact?—It is a custom immemorial in that district.

9247. And by adherence to that custom immemorial they have been enabled to furnish a quality of iron which has enriched the proprietors and has gained them a reputation for the iron?—That may be.

9248. (*Mr. Hughes.*) Has it enriched the workmen?—Not that I know of, men don't get rich by being fined.

9249. Are the men better off there than elsewhere?—In one respect, namely, that their prices do not rise and fall.

9250. (*Mr. Mathews.*) They are better satisfied perhaps to work there, notwithstanding the stoppages, than any other place in England. Is it not a privilege to the men to get into those works?—And it is often a privilege to get out again.

9251. (*Mr. Hughes.*) It seems to me from what you state that the employment in these particular works is very much desired by the men?—Occupation is always desired by industrious men.

9252. But occupation in these particular works. It seems to me from what you have said that employment in these works is considered a great boon?—I am not aware that I have said anything of the kind. Employment is a great boon in all works.

9253. Did you not admit or say that the wages were higher there than in other places?—They are regular and decidedly higher.

9254. (*Sir D. Gooch.*) Is it not the fact, with regard to this plan which they adopt of rejecting all iron made of inferior quality, allowing a certain margin, that by that means the character of these works has been kept up, so that the employers know that they will have constant orders and more regular work than they have in the other ironworks in the world, and that the men are deriving the benefit of that arising from that very process?—It does not arise entirely from that process. Lowmoor iron is subject to a different process of working on the one hand, I admit, but it arises as much from the fact of the superior quality of the ore. The Lowmoor ore and the ore of that district is much superior to any other ore in England.

9255. You know that Lowmoor iron is sought for special purposes, not only from the nature of the ore, and that engineers will willingly pay 2*l.* or 3*l.* a ton more for the Lowmoor iron because they can rely upon its quality?—Yes.

9256. And that quality is obtained by that regulation which you denounce?—I am denouncing no regulation,

9257. It is obtained by the custom which you denounce?—You may put it in that way if you please. Supposing that a man has made a ton of iron which is manufactured into so many plates, and a certain portion of them are injured, some portions of those plates may be made marketable, but the whole of those plates is sacrificed by the men.

9258. But they dare not sell it?—They dare use them.

9259. (*Mr. Mathews.*) Are they ever manufactured for the purpose of sale?—I have no doubt that they are sometimes sold, or used by themselves.

9260. (*Sir. D. Gooch.*) The Lowmoor ironworks will not send out bad iron, and they share the loss of any bad iron with the workmen in the way that you describe?—Yes, but they get a high price and they can afford it.

9261. And the workmen are constantly employed?—No; they are subject to commercial pressure the same as other people.

9262. (*Mr. Mathews.*) You state that the excellent quality of the Lowmoor iron is owing to the ore and coal, as I understand you?—I said that that was one cause.

9263. Is not the same ore and coal open to the other South Yorkshire works?—Yes, and they compete with the Lowmoor works.

9264. But they do not get the same name as the Lowmoor works, which have established a reputation and can maintain higher prices?—I think they do, they are not all engaged in the same department.

9265. The price of Lowmoor iron is higher than any other Yorkshire iron, and that is by reputation for quality and the great care in the manufacture?—But the remark does not apply to Lowmoor exclusively. The same principle is in operation in all the works in the Leeds district, extending from Leeds down to Lowmoor, and the same system of blackballing or black lists is carried out. You may ask why the men do not leave the district. The answer is, because they cannot work anywhere else. It is a very different process from the puddling of other districts, it is a different system altogether—hence the men cannot execute the kind of work that they do in South Staffordshire or the north of England.

9266. If the other works attempt to follow out the same process as the Lowmoor works carry out, it is to endeavour to establish the same reputation, I suppose?—If they do, but I am not aware that they do, except in the works in Leeds, Farnley, and Bowling.

9267. But if they do not, that accounts for the supremacy of the Lowmoor iron, does it not?—If they all had the same ore I suppose the result would be the same.

9268. But they all have?—To a considerable extent. The Lowmoor has not the whole of the royalty. I may say that I can perceive as much rattening amongst employers as amongst workmen. I can mention a case of an employer who discharged a man who is a steady industrious sober workman, simply because he is one of the men who refused to work at the reduction. Many cases of that kind occur, and in that way men are thrown out of work and prevented from earning their bread.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

1, Park Prospect, Westminster, Friday, 22nd November 1867.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.
The Right Hon. the EARL of LICHFIELD.
Lord ELCHO, M.P.
Sir DANIEL GOOCH, Bart., M.P.
HERMAN MERIVALE, Esq., C.B.
JAMES BOOTH, Esq., C.B.
JOHN ARTHUR ROEBUCK, Esq., M.P.
THOMAS HUGHES, Esq., M.P.
FREDERIC HARRISON, Esq.
WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. A. S. Hewitt. 22 Nov. 1867.

Mr. ABRAM S. HEWITT further examined.

9269. (*Chairman.*) You have some information, I believe, with respect to the rate of wages at the works in Creusot in France?—Yes. It is the largest ironworks in France. From the official statement published by Messrs. Schneider and Co., the proprietors of Creusot, it appears that the average rates of wages paid in 1866 at those works were as follows: ore miners, 3·33 francs, coal miners, 3·25 francs; the average of the men employed around the blast furnaces, 2·95 francs; the average of the men around the rolling mill, 3·83 francs; the average of the men in the machine shops, including skilled machinists, (the larger portion of these men were skilled machinists) 3·40 francs. I may say here that that is the most marvellous thing that I have seen in Europe that machinists are to be got at any such rate; and I was so struck with it that I inquired of Mr. Schneider whether there was not some mistake about it, and he assured me that that was the real fact.

9270. (*Mr. Harrison.*) There is no union in France?—No, there is no union in France. I have stated that 3·40 francs is the average of all the men employed in the machine shops. Of course anyone who is the proprietor of a machine shop here will be able to tell you the ratio of a skilled machinist to other workmen.

9271. Does that average include the boys?—It is the average including everybody in the machine shops.

9272. (*Mr. Hughes.*) I saw Mr. Schneider's great place at the Exhibition, and he seemed to me to do as high class machine work as is done over here?—There is no better machine work done in the world than is done by Messrs. Schneider and Co. in these machine shops; there is no establishment in the world on a grander or more perfect scale, than theirs.

9273. I saw in his place at the Exhibition the models of a great number of institutions about the works which appeared to be more or less common to his workpeople. Would not that account, perhaps, for the lower rate of wages?—I think I had better finish my statement before I answer that question. The average for the miscellaneous labour is 3·03 francs. The average paid for the whole of the 9,950 workmen employed in this establishment is 3·45 francs per day. Now their tables do not show the specific prices paid for specific branches of labour, but at Sireuil, another French works, I have procured that information. For common labourers there the average is 2·50 francs per day, which was also the price paid at Creusot for common labourers. I asked that question and so I know that it is the same: puddlers 8 francs per day, which is also the rate at Creusot; puddlers' helpers 2·50 francs a day; they are paid the same as common labourers. Puddle bar rollers 5 francs a day; shinglers 5 francs a day; heaters 7 francs a day; heaters' helpers 2½ francs a day. Finishing rollers 6 to 7 francs a day. Machinists 3 to 3·50 francs a day. Those are regular machinists, and that confirms the other statement made as to the workers in machine shops at Creusot.

9274. (*Mr. Harrison.*) Does that exclude boys?—At Sireuil the average wage of a full-grown machinist is 3 to 3·50 francs per day, a man that does the regular work of the establishment.

9275. (*Mr. Roebuck.*) Is that a high class of labour?—At Sireuil it is an ironwork, and the kind of machinist that they have about an ironwork must be a very good man, but not as nice a workman as they would have at Creusot, where they make locomotives and tools. At Sireuil he is a rougher class of machinist than at Creusot. Masons average 5 francs per day. Now I will state the prices of commodities: wheat bread, 25 centimes per lb., that is to say, the half of a kilogramme.

9276. (*Lord Elcho.*) Is that the regular market price regulated by the Maire?—This is the rate just determined in Paris by the decree of the Préfêt of Police. I do not think it applies to Creusot. At Creusot it is rather dearer, as the quality at Creusot is poorer than the quality at Paris, and at Paris the baker cannot make it pay for 25 centimes the lb., but he goes to the préfêt every week and gets his allowance for selling it at that rate. Wheat bread, as I said, is 25 centimes, rye bread 20 centimes, beef 65 centimes, mutton 75 centimes, veal 75 centimes, pork 75 centimes, chicken from 1 franc to 2½ francs (that, of course, according to the size of the chicken), a goose is 3 francs (there does not seem to be any variation in size among geese), a duck is from 1½ to 2 francs, butter is 1 franc per lb., a dozen eggs from 50 centimes to 1 franc (that, I suppose, is according to the season), potatoes 50 centimes per décalitre, vin ordinaire 40 centimes a litre, beer 25 centimes a litre, and house rent is 3*l.* 5*s.*, or we may say 3 guineas, as gold, as near as may be, per annum, with a small garden.

9277. Do you know the size of that garden?—Those gardens I should think were generally 50 feet by 100; that would cover the size of the garden.

9278. For one family?—Yes, for one family. Now it was stated by a labourer at Sireuil that with 2½ francs, a day's wages, he was able only to have meat once a week, and that was on Sunday. I was also told by the proprietors that they were making no money in the manufacture of iron in France (and I am sure of that from my general comparison), and it was therefore impossible for them to give any higher rate of wages than they were now giving. I therefore come to the conclusion that the iron business in France rests upon the essential condition of giving meat to the labourer only one day in the week. That is the conclusion to which I have been driven from the facts which have come under my notice.

9279. (*Mr. Roebuck.*) According to the present state of things that is to say?—I do not undertake to say what is possible or conjectural. I deal with the facts as I find them.

9280. (*Chairman.*) Have you any ratio of the quantity of the product of labour at 2½ francs compared with the product of labour that cost 7*s.* or 8*s.*? There is sometimes a direct ratio between the feed of oats and the number of miles the horse can go.—I cannot give any such ratio as that, but I can say this in a general way, that there was a deplorable look of hopelessness on the part of the labouring classes that I had never seen anywhere before, a downright lack of spirit, and what you say about oats and the horse I think is eminently true of man and his work. And more than that I think that independence of character

and of opinion is to a very great extent dependent upon the feed which a man gets.

9281. (*Mr. Hughes.*) Are you speaking now as to the appearance of the workmen at Schneider's works at Creusot, because we have heard very different stories of them ?—I speak now of my observation of common labourers as I saw them everywhere, at Schneider's at Sireuil, and at every other place where I saw them.

9282. (*Sir D. Gooch.*) If you do not know the amount of work in proportion, perhaps you can tell us what quantity of work is done by the puddlers who gets 8 francs a day ?—I am prepared to testify as to what the puddlers accomplish. As to the puddlers and rollers I can say that they do quite as much for the money I have stated as is done in England for your money or in the United States for our money.

9283. (*Mr. Harrison.*) Do you think that the work is as hard—I mean that the iron is as difficult to work ?—I think it is. I do not see any difference in that respect. I will give you some testimony about the quantity of work done at Creusot. In the puddling furnaces, the work of the puddler is as hard in the one case as in the other ; it is in the balling up that the hard work comes in any case, when white iron is puddled.

9284. We have had it now repeatedly in evidence that the particular condition and quality of the iron, the greyness for instance of it, makes all the difference as to whether the puddler can do precisely the same amount of work in nine hours or in 12. I meant whether you were convinced that taking a perfectly equal quality of iron, and equal difficulty of work, the Creusot puddler produces for that money precisely the same result as the English puddler ?—That he gives as much muscle to it for his day's work, and for the money that he gets, as you do in England for your day's work for the money that the puddler gets here ? I think he does ; that he spends as much muscle on it. At Cresuot, for puddling rails white iron is used, they make 11 heats per day, or 2½ tons in the furnace with one puddler and two helpers. There is nothing peculiar in the furnace. The puddler gets 8 francs a day, the first helper gets 5½ francs a day, and the second helper gets 3½ francs a day.

9285. (*Mr. Mathews.*) 11 heats would mean two turns ?—No, that is from one turn, it is nearly double what we do anywhere here.

9286. It is a mistake ?—No I cannot be mistaken, I said to Mr. Schneider, "What peculiarity have you "in your furnace that enables this extraordinary "work to be done ?" He said, "None, the iron works "very fast," then I looked at the iron and found that it was white iron, but the work is very hard upon the puddler.

9287. (*To Mr. Jones.*) Is it possible to turn out 11 heats in a puddling furnace with any amount of labour which you could apply in England ?—I think not.

(*Witness.*) I testify that Mr. Schneider told me this.

(*Mr. Jones.*) I had it from a gentleman who visited Mr. Schneider, tbat they were producing an immense quantity of iron from some of the furnaces.

(*Witness.*) This is not from any subordinate, but from the young Mr. Schneider's own lips, and therefore I take it that it is correct, but you observe that he gives him, the puddler, an extra helper.

9288. (*Mr. Mathews.*) Is it customary to use white iron at Creusot ?—For rails, not for other work.

9289. Is the character of the pig iron similar to that of the pig iron made in England in the long run ?—I think that at Creusot the character of the pig iron in some respects is better than the pig iron which I see here, and in some respects it is worse.

9290. When you speak of better or worse, do you apply that to the degree of greyness or otherwise ?—I apply it to the ore from which the pig iron is made, and the grey nature of the iron employed.

9291. Are you aware how much they can turn out of grey iron or of white iron ?—I made no memorandum of that, but I believe that when they work this very grey iron, they make five or six heats. At Creusot they produce seven different qualities of manufactured iron, and of course in making those seven different qualities, they use different mixtures of pig, and give a different amount of labour to it. I examined the iron with care at the works, and I have never seen more beautiful material nor better workmanship done anywhere.

9291*a*. It is made with coke, not with charcoal, I suppose ?—It is made with coke. Their furnaces run with coke. In my judgment the great bulk of their ores come from Algiers and Elba.

9292. (*Mr. Merivale.*) What is the ground round there, is it alluvial sand ?—Creusot is in a coal-field and the soil is the ordinary sandstone, and the main ore that they have there is a fossiliferous ore, very lean.

9293. (*Mr. Mathews.*) Is the Algiers ore similar in character to the Elba ore ?—No, the Algiers ores were all magnetic oxides, while the Elba ores were all peroxides. I have another point which I may mention here. In Paris the working men seem to complain of the price of bread and the high rents, which compel them to live a very long distance from their work, so much so, that one of them told me that he was always so exhausted when he got to his work in the morning, that he required to get an additional meal in order to enable him to go to his work. He had to get up before daylight and come four or five miles on foot (he could not ride), and he was so exhausted at the end of the time that he had to get something to eat. I asked him whether that was the general practice, and he said yes.

9294. (*Lord Elcho.*) What class of man was that ? —This man that I speak of was a perfumer, and you would not think perhaps that his work was heavy. Still he had this long walk to take, and he said that it was the general thing with all mechanics there.

9295. (*Mr. Roebuck*). As to the price of bread, did the artizans in France believe that the price of bread was properly under the dominion of anybody, that it was not to be settled by nature and production, but that it could be put under the dominion of the préfêt ?—I did not discuss the question with the common workman.

9296. You said that he complained of the price of bread. Now the complaint might be that the préfêt had made a wrong judgment, or he might fancy that nature had given him the doom of heavily priced bread ?—No, he simply said that the price of bread was so high, and the price of rent so high, that with 5 francs per day which he received for wages, he could barely keep his family together.

9297. The Préfêt in Paris does fix the price of bread, does he not ?—He did some time ago fix the price at 50 centimes the kilo. There is a provision in that decree that the baker may have his reimbursement.

9298. Did the workman merely mean that the préfêt had made a wrong decision ?—He never even referred to the préfêt.

9299. When he complained of the price of bread did he complain that bread was too dear by the combination of certain people, or by the effect of nature ? —I think he meant that his wages were too small to buy him bread at the price.

9300. I ask you the question because in the one case it is utterly impossible to alter the price of bread, and in the other case it might be altered, that is to say if the complaint was made of the préfêt's decision ?—I am perfectly satisfied that this workman had never got beyond his stomach. I do not think that it had ever got up into his head so as to lead him to consider how it was that the price of bread was so high or his wages so low.

9301. I heard a statement made in an English railway station that bread ought never to be beyond a certain price. The person who said that did not know the rules that govern the price of bread ?—No doubt.

Mr. A. S. Hewitt.

22 Nov. 1867.

9302. (*Mr. Mathews.*) Did you ascertain when at Creusot whether there was any work going on there for the English railways in the shape of locomotive engines?—No, I asked no questions as to the destination of the work. I saw the work going on and engines being built there.

9303. (*Lord Elcho.*) You are not aware that there was an engine in the French Exhibition, made by Mr. Schneider, at Creusot, which is a specimen engine, one of 40 made for the Great Eastern Company in England?—I was not aware of the destination of the engine, but I saw his engine in the Exhibition, which I regarded as a beautiful piece of workmanship.

9304. (*Mr. Harrison.*) With regard to the wages of the puddlers which you have given us, I suppose that the amount was calculated upon the earnings of the men in the course of the day, was it not?—I gave you the amount by the day. I found over there that they were as ready to pay by the day as by the piece.

9305. Are they not paid by the piece?—In some cases by the piece; in others by the day.

9306. If they turn out 11 heats in the course of a day, and their wages are still only 8 francs in the day, the price per ton must be very low indeed where they are paid in that way?—At Sireuil the price was 8 francs a day. The puddler was paid by the day. As I have testified about the common workman, let me say this, that the puddler who gets his 8 francs a day at Sireuil said that he had meat every day, and that he was able, out of his 8 francs, to save about half his wages,—in other words, the additional $1\frac{1}{2}$ francs which he spent over the $2\frac{1}{2}$ francs of the common labourer enable him to have meat every day, while the common labourer said that he had it only once a week.

9307. Did you make any observation as to the employment of women in the works?—At Creusot I did not see a single woman in the works.

9308. (*Lord Elcho.*) As to this puddler who you say had meat every day, and at the same time saved 4 francs out of 8, was he a married man?—Yes.

9309. Do you know how many children he had?—No, I do not, but children are not so abundant in France as they are in England, I may say.

9310. Did you make any inquiries as to what more especially comes within our province, the associations of workmen among themselves?—I asked the question as to the associations of workmen among themselves, and was told that they were not known in the provinces.

9311. Are there no benefit societies there?—At Creusot the only benefit society is the one administered by Messrs. Schneider & Co. themselves. I asked Mr. Schneider how it was organized, and he said by a rate of $2\frac{1}{2}$ per cent. assured upon all the wages of all the people in the work. That is put into a fund and administered by the proprietor; and the morning I went into the office I saw in the outer hall, I should think, five or six persons who were evidently sick, or had been injured, sitting there and waiting for an audience of Mr. Schneider, who administers the relief.

9312. I presume that a trades' union in our sense of the term is illegal.—I do not think that it is illegal, but you have that in Mr. Fane's communication.

9313. (*Mr. Mathews.*) Is that $2\frac{1}{2}$ per cent. levied exclusively on the wages of the workmen, or is any portion of it contributed by the principals?—As I understood it, it is $2\frac{1}{2}$ per cent. exclusively levied upon the workmen. I did not hear of any contributions from the principals.

9314. (*Mr. Hughes.*) Those institutions to which I alluded, of which there were models in the Exhibition, were maintained out of this fund, provided by the $2\frac{1}{2}$ per cent. I suppose?—I so understood it.

9315. (*Mr. Roebuck.*) You say that the fund was in the hands of Mr. Schneider himself.—I only infer that from the fact of my seeing persons waiting in the ante-room as I have described.

9316. (*Mr. Harrison.*) Did you enquire or hear whether he had in the course of his experience had anything in the shape of a strike to deal with or any combination among the workmen?—I asked him the question "Have you ever had a strike at Creusot?" and he said "No." I said "I should think you would at times." "No," he said, "the people here work in the place usually their whole lives." I said, "Do not they often go away?" He said "No, there is the livret." I did not know then what a livret was, but I went back to Paris and got a livret from the police, and I have attached it to my report to my own government, and I find substantially that a French workman cannot be received by any employer in France unless his livret is endorsed by his last employer, and that if any wages are due from the workman to the employer it must be endorsed upon the livret, and it seems to operate as a kind of mortgage or lien upon him following him wherever he may go.

9317. In fact it is equivalent, is it not, to the discharge note, and things of that kind which have been introduced in certain trades in some parts of England?—I know nothing of that.

9318. Are you aware that it has been stated that the same plan has been adopted in England by railway companies with regard to drivers of engines?—No.

9319. (*Lord Elcho.*) Is it the custom of the country in France to have this livret or is it the law?—The law of livret is a regular French statute law.

9320. It is not a custom that has grown up on the part of the employers?—No, this law of livret was enacted in the year '12, and has been modified by a new law in 1854, and a decree of the emperor in 1855. I got a circular from the préfêt in which he explains to the working men that so far from its being a hindrance to them it is a concession made by the Emperor Napoleon for their special benefit.

9321-2. (*Mr. Hughes.*) He has modified the law in a liberal sense?—Yes, he has. I wish to say further that the préfêt said that in Paris the livret was not strictly enforced, but in the provinces it appeared to be strictly enforced. I heard that there were no strikes in France in the ironworks, and I heard assigned as the reason the fact that the law of livret was an impediment.

9323. Taking the general condition of the better paid class of workmen whom you saw at these works, what do you consider their condition to be as compared with your own men who work at the same employment in America?—The better class of workmen in France appear to me to be comfortable and intelligent both, and I do not think that I can say more than that of any class of workmen anywhere.

9324. (*Mr. Merivale.*) Then this general air of depression of which you speak did not extend to them?—It was not so characteristic of the upper workmen as it was of the very lowest class.

9325. (*Mr. Roebuck.*) Did you get anything like an accurate idea of what their habits were, and whether their habits of dress and living and their amusements were better or worse than those of your own men?—I should say that their dress was very much inferior to the dress of workmen in our country, that their habits were much less expensive, and that their amusements were decidedly, apparently at least, less expensive than we have. I think that in our country there is much greater cheerfulness and a much larger expenditure among the working classes than in France.

9326. Had you any opportunity of judging of the intelligence of those men?—To some extent. I talked with the puddlers only with reference to their own work around the furnace, which they seemed to understand as well as workmen ordinarily do.

9327. (*Mr. Mathews.*) What about the degree of sobriety of the workmen?—I should think, as far as my observation goes, that it was decidedly in favour of the French; they are generally a more sober class. They drink wine to a great extent, common wine, but still, an honest wine, I think, and in the long

time that I was in France I certainly did not see more than two or three drunken men. The only case I can now recall was that on the day I left Paris I saw a drunken cabman.

9328. (*Mr. Roebuck.*) Is it in accordance with your experience that generally in wine-growing countries there is more sobriety than in other countries?—That is the observation of all travellers, I think.

9329. (*Mr. Harrison.*) And since beer has been introduced largely in Paris there has been an immense increase in drunkenness?—I think so.

9330. (*Mr. Hughes.*) I understand you to say, that in your belief the ironmasters, at present, in France are making no profits?—That is my belief.

9331. The men are under-fed and depressed in appearance, you say?—The common labourers.

9332. But the work turned out is as good as that turned out anywhere else in the world?—As far as my judgment goes.

9333. Then how do you account for such a state of things as that?—I think that the character of work done (I speak now of machine work), depends very much upon the supervision which is given to it, and that with intelligent foremen, even depressed and under-fed workmen will turn out good work, because that is mostly a matter of supervision and tools; and the supervision and tools in France, as I saw them, are equal to any in the world.

9334. (*Lord Elcho.*) Are they home-made tools? By "home-made" I mean French tools.—They are mostly French tools, but generally copied from English models.

9335. (*Mr. Hughes.*) But that state of things which you have described must come to an end?—I sincerely hope it will come to an end; that is one of the very objects that I have in view.

9336. Will you tell me what you believe to be the cause of it. Do you believe that unlimited competition has anything to do with it?—If you ask me my individual judgment, I must answer, yes. I do not think that that judgment is of any value in a matter of this sort, because everybody has as good a right to an opinion as I have, but all I can say is, that it is the conclusion which has been forced upon me by observation, and forced upon me against all my preconceived notions, that unlimited competition has brought about this state of things.

9337. (*Mr. Roebuck.*) Unlimited competition between whom?—Between all the world.

9338. So that in fact you think that unlimited competition is a thing to be regulated by law?—You must excuse me if I do not pass a judgment of that sort. I have been trying to make as philosophical an observation as I can of certain facts. I find as one result of that observation a large portion of the people engaged in labour reduced to what I regard as a very miserable condition; I am asked what I think is the cause of it. It seems to me that the unlimited competition to produce articles at the lowest possible rate for sale in the general markets of the world without any regard to the condition of the labourer is the cause of it. How that shall be regulated I am unable to say.

9339. (*Mr. Booth.*) You do not see your way to any remedy?—I do not at present, and I say that with a conviction in my own mind that there is a fallacy lurking in this thing somewhere, either in my own observation of the facts, or in the conclusion I have drawn from them, or in the organization of society, upon which no one has yet been able to put his finger. What that fallacy is I do not know.

9340. (*Mr. Merivale.*) Is competition unlimited in France according to your view of the meaning of the words?—It is unlimited between themselves, but if you mean as between nations, I will answer that question in this way. There is a tariff in France upon English iron and Belgian iron, but owing to the superior natural advantages which the British ironmaster possesses for the manufacture of iron the French people are compelled to reduce their wages below the standard of wages in England, even with the tariff they have, in order to keep up any competition.

9341. And that you call unlimited competition?—I call that unlimited competition, except so far as it is limited by this tariff.

9342. (*Mr. Roebuck.*) Do not you think it a bad application of capital to use it upon matters which necessarily will not give the ordinary return?—You ask me a question now which involves a good many considerations. If you ask me that question with reference to England, I would say yes; if you ask me that question with reference to the relation of capital in two different countries, as the thing now stands, I would say no.

9343. (*Mr. Hughes.*) Is it not necessarily a bad application of capital. How can Mr. Schneider carry on these enormous works at Creusot if he loses by them?—Mr. Schneider states in his publication that the result of the investment at Creusot has been that the stockholders have received 8 per cent. per annum, besides laying by a fund for extensions and renewals. But he stated to me that the business at present was unprofitable.

9344. (*Mr. Mathews.*) May not that explanation be found in the circumstance of its being for the manufacture of other articles, irrespective of the dry manufacture of iron, for instance, the manufacture of locomotives may be productive of gain, while that of the dry iron may be a loss?—That may be true. Mr. Schneider also stated to me that the transportation of iron ore from Marseilles to Creusot, which is a very long distance indeed, was done at a rate equivalent to a little less than a halfpenny a ton a mile.

9345. (*Mr. Mathews.*) Is it brought by rail?—It is brought by rail all the way.

9346. (*Mr. Harrison.*) Will not the necessity for importing a very large proportion of the ore account for the seeming anomaly that you have wages at the lowest point, the most excellent supervision and management, a manufactured article most excellently turned out, and almost no profit made, and yet that they do not undersell the whole world.—In my judgment I testify that the wages of labour are as a general thing in proportion to the natural advantages which the country possesses for the manufacture of the goods.

9347. Then you think that in point of fact that explains the anomaly of the absence of profit, that the ore has in large proportion to be imported.—I think so. I think that that is one of the leading elements.

9348. (*Mr. Mathews.*) Can you say what is the comparative price of railway iron at the Creusot works as compared with English railway iron?—The price of iron in France is about a 1*l.* a ton higher at the works than the corresponding price in England.

9349. So that assuming that the price of rails in England would be 5*l.* 10*s.*, the price of rails in Creusot would be 6*l.* 10*s.*?—I should think so.

9350. And with the price 1*l.* a ton higher than in this country the disadvantages under which they labour in respect of the importation of their ore from long distances more than counterbalance their advantages?—I think so.

9351. Though the importation of foreign ore may be a disadvantage, the manufacture of articles may involve a considerable profit to the proprietor.—It might, but I know nothing of the fact. But you must consider the magnitude of these works. There are 15 blast furnaces, and a rolling mill which is 1,400 feet long.

9352. Are you aware of the amount of railway iron produced at those works?—I know the total number of tons of wrought iron produced in the mill, it is 110,000 tons a year.

9353. That is iron of every description?—Wrought iron of every description.

9354. You do not know what amount of rails is produced?—It is an impression on my mind that about 30,000 tons of that quantity are rails.

9355. And does your observation as to the price of the iron being 20*s.* a ton more than the price of

Mr. A. S. Hewitt.
22 Nov. 1867.

English iron apply to bar iron as well as rails?—That seems to be the difference. There is a duty which enables English iron to compete with French iron in Paris.

9356. (*Mr. Harrison.*) Are those puddlers whom you have spoken of as earning in France 8 francs a day the same class of men of whom we heard yesterday as getting 10 guineas a week in this country?—I testified before that I found a guide roller here who was getting 25*s.* a day.

9357. But we have had 10 guineas a week stated to us?—I do not doubt that a man who is competent to heat one of those enormous plates that I have seen rolled for John Brown & Co., so as to be responsible for the heat of that enormous mass, commands 10 guineas a week, and that he is cheap at 10 guineas a week too.

9358. (*Mr. Mathews.*) What is the duty upon English rails imported into France?—I cannot say at this moment. It is not heavy.

9359. (*Mr. Harrison.*) Your report to your own Government will be published some day, I presume?—My report will probably be published in the course of three months.

9360. (*Chairman.*) Can we be allowed to have it?—I have no objection at all to submitting the report to the inspection of any gentleman here with reference to asking questions of other people, but it would not be proper for me to let you have the report in advance of sending it home. I may say that it is exactly in the direction you are proceeding that I have conducted my investigation, and it was the hope that I might learn something to help me in my inquiries that brought me here originally.

9361. (*Mr. Mathews.*) With regard to the manufacture of plate iron at these large works at Creusot, are there any plate rollers in these works?—There are plate rollers there.

9362. Does the plate roller take the whole charge of the mill, and pay his under-men as he does here?—I cannot say that.

9363. You cannot draw any comparison then between the wages of a plate roller here and one in Creusot?—No, but I may say that at Creusot they do not roll heavy plates. Petin Gaudet and Company, roll heavy plates, but they publish no statement. Returning to the question of Mr. Hughes I may observe that the greatest social evil of modern times seems to me to be this, that the barrier separating honest labour from pauperism is so slight that a man never knows how soon he will be crowded from the one side of the dividing line over to the other side. I think that a man who has a family, and who from the organization of the community in which he lives is in perpetual dread that within 24 hours his family may be brought to want, cannot be happy. That is the idea that I have of the subject, and that is the great advantage which I see at present in the United States over these older civilizations. Owing to our soil, owing to the fact that we have a great outlet, owing, if you like, somewhat to our institutions; our working men are not in the condition in which I find workmen over here, that they cannot see ahead.

9364. (*Mr. Harrison.*) Do you know any institution in England which guarantees a man against that state of things except the unions?—After looking over the constitution of the unions, if you ask my judgment I do not think that they guarantee him against it.

9365. (*Mr. Hughes.*) Do you think that that is their object?—I think that these working men believe that they are working on sound principles for their own elevation and benefit, otherwise of course they would be fools to do what they do. Whether they have got the right of it or not is a totally different question. That as I understand you are here trying to find out. The working men themselves ought to be as grateful for the information as the community at large will be. It is a problem to be solved. If they are right we must reorganize things in our own country.

9366. (*Earl of Lichfield.*) With reference to some evidence which you gave us when you were here before, with regard to the rate of wages in this country and in America, will you tell me whether your attention has been called to an article in the "Chicago Tribune," which appeared soon after you gave that evidence expressing an opinion, which opinion was based on information obtained from this country, as to the cost of living here, that opinion being that the wages received by the ironwork men in this country went further than the wages received in America?—I did not see the article, but I can testify without hesitation that any such idea is totally fallacious. The reason is this: As the mayor of Pittsburgh has informed you, the only question in Pittsburgh was between 7 dollars and 9 dollars a ton for puddling, that is to say, between 21*s.* and 27*s.* Now, taking the lowest rate, 21*s.* a ton for puddling, against the rate for the same class of puddling here, namely 8*s.* 6*d.*, there is a difference of $2\frac{1}{2}$ fold. Any man can see that there is no such difference between the cost of living in America and here. Beef and grain, the necessaries of life, are cheaper in America; the things which are dearer are clothes and house rent. Now clothes are things that people may be as economical as they like about. In France they wear a blouse; in America our workmen on holidays are usually dressed in full cloth suits.

9367. (*Mr. Harrison.*) At the Creusot works did they work on Sunday?—I was not there on Sunday, but my impression is not, that is to say, the rolling mills do not, I think, but the blast furnaces must. I think I can say that the puddling mill does not work on Sunday, because the puddling furnaces must be repaired once a week. I have had the point raised as a religious question in my own country. A clergyman said to me, "How can you consent to "allow your men to work on the Sunday?" My answer was, "I let five men work on Sunday in "order that 500 men may not be deprived of their "work on Monday." Will you allow me to say that I have been shown a letter here from the mayor of Pittsburgh addressed to Sir Edmund Head. I wish to say in regard to that letter, that the mayor has made the obvious mistake of supposing that I testified in regard to the Pittsburgh strike, and the outrages which were alleged to have taken place there upon my own knowledge. Now I was careful to say in my testimony, that I received the information from a manufacturer residing in Pittsburgh, and when asked for details, I repeated that I had no personal knowledge of the subject whatever, and subsequently, when it was commented upon in the London "Times," I returned to the Commission for the express purpose of complaining of those comments as unfair, and repeating that I had no personal knowledge whatever of the facts at Pittsburgh, but had only derived them from other persons. Of course I could discharge myself from all responsibility by simply giving the name of my informant, but inasmuch as a public meeting has been held at Pittsburg, at which I have been denounced, I can imagine that it might be an uncomfortable thing to him if I were to do so, and therefore I do not think it right to give his name, beyond saying that he is a man of high respectability. There is one point in the mayor's letter in which he is right, and I am wrong, that is as to the origin of the strike in Pittsburgh. The men were receiving 9 dollars a ton in Pittsburgh, which was a rate peculiar to that place and its vicinity. The iron business having become unprofitable, the owners requested the workmen to reduce the rate to 7 dollars, the prevailing rate in other places; the workmen refused and the mills stopped, and since I went home and have returned, the strike has been settled, and it was compromised by the workmen going to work for a brief period at 9 dollars, with an agreement that it should be reduced to 8 dollars in a few weeks, which I believe has been done. I wish to state this simply because I want all the facts that are stated in my testimony to be correct. The mayor's statement in that respect is technically correct,

although it was never called a lock out, and as I was talking about rates of wages rather than strikes at the time, I did not draw the distinction.

9368. (*Mr. Roebuck.*) It was a lock out was it not? It was a lock out in this sense. They did not lock the mills up, they said to the men, "We cannot give you more than seven dollars." The men said, "We will not take seven dollars;" but the works were open to the men if they wished to go on at seven dollars. There is another point that I must refer to. I stated that the Irish were rarely good puddlers in America. That statement was broadly taken down and has been published, and the Irish have naturally felt aggrieved at home at that statement. Now if I had been asked whether the Swedes, or the Austrians, or any other nations made good puddlers under the same circumstances as the Irish are taught puddling, I should have given the same answer. The reason is this, that in England and Wales puddling is begun to be learnt by the boys around the mills, and they grow up into this knowledge from early boyhood, and hence by the time they get a furnace they are really accomplished and experienced puddlers. In our country the Irishman comes into the country an adult and gets a furnace without having had the advantage of that training, and for that reason simply, that he has not had any early experience, he is rarely a good puddler, but that would be true of other people under the same circumstances.

9369. (*Mr. Mathews.*) It would be as true of English workmen as of Irish workmen?—Yes.

9370. (*Sir D. Gooch.*) Does the number of hours worked in France at all correspond with the number of hours worked in England?—In reference to puddling it necessarily does, and I think it does in respect of rolling, in fact in regard to ironwork I find that the same time is worked all over the world, except in very hot climates where they make three shifts instead of two.

9371. (*Lord Elcho.*) Do you know the highest sum earned in the week by any one puddler in the case where you gave the average of 8 francs?—I think that that is pretty much the regular thing. I do not think a man can exceed that.

9372. You say that they pay 3*l.* 5*s.* for their houses, to whom do those houses belong?—At Creusot they belong to the works.

9373. They are not the property of the workmen?—No, they are not the property of the workmen.

9374. And the gardens attached to the houses equally belong to the proprietors I suppose?—Yes, the grounds and the houses belong to the proprietor of the works, and the workmen pay rent for them.

9375. Is the work mostly piece-work?—No, I should think not, I should think that in France, the preponderance would be rather in favour of day work.

9376. Have you extended your inquiries to other works than ironworks?—No, I have not, because my time was absolutely occupied with this investigation.

9377. Did you extend your inquiries to the ironworks in Belgium or Germany, and have you any knowledge of the circumstances of the trade there?—Only by inquiry, not by any personal investigation, hence I would not wish to testify upon that subject. The rates for Belgium are very well given in Creed and Williams's pamphlet.

9378. You could not give us any general impression which you have formed with respect to the state of trade in Belguim and Germany?—I can say that I think that the condition of the workman is better in Germany than it is in Belgium. He is better fed and educated in Germany than he is in Belguim.

9379. (*Mr. Merivale.*) What part of Germany do you speak of?—Rhenish Prussia.

9380. (*Lord Elcho.*) Do you know of any one who could give us evidence on those points, with reference to Belgium and Germany?—You have two Englishmen here who have gone and made this special investigation, Creed and Williams, and who have published the result of their inquiries.

9381. (*Mr. Hughes.*) In one of these letters from Pittsburgh, which are printed in the document I hold in my hand, the writer says, "Ten shillings in England is as good as nine dollars here." I suppose that is a great exaggeration in your judgment?—Nine dollars in currency would be about 27*s.* I should say that it is a great exaggeration moreover.

9382. (*Mr. Harrison.*) With respect to the rate of wages, is there a greater variation in France, in the rate of wages, according to the individual skill of the workmen than there is in English works; for instance, are the puddlers all paid at the same rate?—I should say that there was a greater discrimination in England in favour of skill than there is in France.

9383. (*Earl of Lichfield.*) You have told us what the puddlers ordinarily earn at Creusot; how many hours do they work a day there?—The usual time that a puddler or his helper has to be at the furnace is 12 hours, but they do not work continuously 12 hours; between the heats and the making up of the fire 12 hours is consumed.

9384. Are there many children or women employed in the works?—I saw no women in the works at Creusot, and I saw very few children, those that I did see were boys not younger than 13 or 14, I should say, and there are schools at Creusot in which the younger children are all engaged in being instructed.

9385. That is to say "the younger children belonging to the men employed in the works"?—Yes, they were undergoing instruction, and in the Exhibition of Paris there were very beautiful specimens of their work. I may say here that I do not think that there is over-education there.

9386. Is the expense of those schools borne by the levy of $2\frac{1}{2}$ per cent. which you have spoken of?—My impression is that the whole of these educational arrangements are paid for out of the $2\frac{1}{2}$ per cent. on the wages. The organization which Mr. Schneider has effected has been done upon the basis of the earnings of the workmen, but I would not say that there is not any contribution out of the funds of the proprietors. I am inclined to think that there must be a contribution from them.

9387. (*Mr. Roebuck.*) You say that in the ironworks at Creusot no women are employed?—I saw none.

9388. Did you ever find any employed in England?—In South Wales, as I stated in my former evidence.

9389. (*Chairman.*) Is there any other matter to which you wish to call our attention?—There is another matter to which I should refer before I leave. On my return to America I endeavoured to get the information which I was asked here to get with reference to any case of intimidation that has occurred. I stated that there was a case in Newark, New Jersey, in which the men had been indicted. I went to the district attorney, Mr. Parker, and asked him if it was so, and he said, Yes, the men were under indictment. I asked him if there were any statute under which they were indicted, he said, No, that it was at common law, and that the case would be tried in the next term of court, under the general principles of the common law of England, and that he would furnish me with a printed copy of the whole affair, to be sent to this Commission, and I presume that that will cover the discussion which is going on here as to what the common law is on that point. The men are under indictment for having conspired to prevent other men from working for a Mr. Marsh, a carriage maker. The point to which I call attention is that there seems to be no special statute beyond the ordinary common law of England. and that it is an indictment under the common law that they are to be tried upon.

9390. (*Chairman.*) Could you kindly bear in mind when that matter comes to be decided, to give us the decision?—Yes. It ought to be decided by the time I get home.

The witness withdrew.

Mr. J. Jones.

22 Nov. 1867.

Mr. JOHN JONES examined.

9391. (*Chairman.*) I believe you are the secretary of the Ironmasters Association for the North of England?—I am the secretary of the Iron Manufacturers Association, and of the Ironmasters Association also. We have two distinct associations in the North of England, the one relating to blast furnaces, and the other to manufactured iron.

9392. Is that one institution?—They are distinct organizations.

9393. Are they of the same date, or is one of longer standing than the other?—I think they have both been in existence for a considerable length of time, but they have been reconstituted, perhaps within the last three or four years.

9394. How long have you been secretary?—Since July 1866.

9395. Are there contributions from the members of the society so much a week or so much a year?—No. Levies are made to meet what expenses are incurred.

9396. When expenses are incurred the executive committee sends notice of a levy?—Of a levy on each of the firms connected with the association.

9397. Is there any reserved fund kept?—In the case of the Iron Manufacturers Association there is a reserve fund amounting now to about 45,000*l.*

9398. Then are the levies and the reserve fund both used in case of trade expenses, if I may use the term, and only for trade expenses. By trade expenses I should understand inquiries and actions considered to be for the interest of the members of the association in the trade?—Yes, all the funds are devoted to those purposes.

9399. Without anything in the way of a friendly society, superannuation, or any of those expenses incident to the nature of such a society?—Quite so.

9400. Can you say what has been the expense during the year that you have been secretary. What has been the expenditure on the part of the masters for trade purposes?—I have no statement except up to Christmas last. That would be perhaps for a year and a half. It refers only to one association, the Iron Manufacturers Association, relating to mills and forges. This statement of accounts in my hand which I may perhaps epitomise, states that for the 18 months ending December 31st, 1866, the association had deposited with the bankers promissory notes to the extent of 47,575*l.* I should explain that according to the rules of the association these promissory notes are given by the different firms, and the association from time to time may place on the fund any firms whose men may be on strike, and may give them an allowance according to the rules. They may then draw upon these several firms for the expenses connected with any particular strike, and these promissory notes are deposited with the bankers as a security that may be used in case any firm should not pay the respective monies required in the shape of levies.

9401. In case of a strike against a specific firm the executive committee have the power to make a levy from that firm do you mean?—No, from the other firms. I should put in the rule, perhaps, relating to that, it is this: "That any member whose men "demand an increase of wages, or any other con- "cession, which, if granted, would be likely to lead "to a general advance, submit the same to the "masters association, who shall appoint a committee "to determine whether such demand is justified by "the generally prevailing scale and practice of the "district, and if such committee recommend a refusal "of the men's demand, and a strike ensue, that there "be paid out of the funds of the association, in re- "spect to the period that such strike is sustained, "with the approval of the association, to the master "whose men have so struck, such sum per furnace" (per puddling furnace that is) "per week, as is "defined by the class under which such master "has placed himself." Each firm may elect under which class they will be placed. If under class A they receive a sum of 4*l.* per week for each puddling furnace laid off; if under class B a sum of 3*l.* per week. At the end of a strike the firm whose men have been out send an account to the association, and the money to be paid is then raised by a levy upon all the firms belonging to the association.

9402. (*Mr. Hughes.*) An account of what?—An account of the number of weeks that the furnaces have been laid idle.

9403. Simply for the puddling furnaces?—For the number of furnaces insured. Each firm state the number of furnaces they insure for; that includes in many cases the number of heating furnaces.

9404. The account, I suppose, is limited to that, "so many furnaces out." There is no general estimate of loss?—No, that covers everything. As I have stated the amount deposited with the bankers for the 18 months was 47,500*l.* There had been paid on "subsidy account" during the 18 months ending 31st December 1866 a sum of 6,012*l.* 11*s.* 3*d.* which had been levied from the firms whose promissory notes were held to the amount of 47,575*l.* Then come the general expenses. There are other expenses that occur in the balance sheet, but the general expenses, printing, and management are 264*l.*

9405. Does that include all the salaried officers?—Everything.

9406. Does it include your salary?—Yes, but you must bear in mind that I only became secretary six months before the date at which this statement terminates. Before that time the matter had been attended to by a gentleman who had not devoted nearly so much time to it as the association wished me to do, and consequently the remuneration was less.

9407. What is the remuneration?—The remuneration from the Iron Manufacturers' Association is 200*l.* a year, and from the Iron Masters' Association 100*l* The salaries appear in this printed statement of accounts which I have already referred to, in fact here are the items: travelling expenses, 22*l.* odd; salaries, 151*l.*; postages, 3*l.*; stamps for promissory notes, 24*l.*; deputation expenses, 5*l.* 14*s.*; two-thirds expense of office furniture and fittings, 25*l.*; printing and stationery, 7*l.* 16*s.*; sundries, 14*s.* 7*d.*; therefore the expenses would be only about 240*l.*

9408. (*Chairman.*) Is there any action of this masters' union, except in case of action by way of strike on the part of the workmen's union?—Yes; that is only a minor part of the work on the part of the association, because there are many matters connected with statistics of exports and imports of iron, and in connexion with railway bills, and various parliamentary matters which affect the interests of the trade. The question of wages and of matters connected with that department, though it occupied a very prominent part during the latter portion of last year, has required very little attention during the present year. I should think that very nearly all the work I have done during the present year has been on questions with respect to matters affecting the general interests of the trade as implicated in parliamentary bills, and so on.

9409. If I understand you rightly, very little of your attention and very little of the expenditure has related to disputes between the employers and their workmen?—I am speaking of this present year.

9410. (*Mr. Hughes.*) What is the meaning of that sum of 6,012*l.* 11*s.* 3*d.*?—That is quite apart from any management expenses; that is paid to certain firms as subsidy for strikes. I will explain that more fully presently.

9411. (*Chairman.*) I thought you said that there had been very little expenditure in respect of disputes between employers and workmen during your time?—There has been no subsidy at all paid this year. I think that nothing has been paid on the subsidy account since the closing of last year's account. But the general expenses incurred in the manage-

ment of the association as a matter of course still run on, and if any question of wages were to arise, the actual secretarial and other expenses incurred in connexion with it would not touch this subsidy account at all except as a levy made for general expenses, because we keep these subsidy accounts entirely distinct. If for general expenses we require a certain sum of money a levy is made on the same principle, but the accounts are kept separate. There is also another account which I ought to mention, for expenses connected with the strike of 1866 (we had a long one then of about 20 weeks), amounting to 89*l.* 9*s.* 10*d.* that is put down as the expense, a little over 90*l.* would be the actual cost, but that is as it appears in our account.

9412. (*Mr. Hughes.*) That is apart from all subsidy of course?—Yes, this is the amount that had to be contributed by all the members of the trade that took part in that movement, because the association does not include all the firms in the district; it only includes those who agree to the subsidy arrangement; there are certain others who do not agree to that arrangement but still co-operate for all general purposes connected with the trade, and they also bear their share of the expenses connected with any combined trade movement.

9413. Can you tell us the expenses of the subsidy during that strike that cost 90*l.*?—We paid no subsidy then. There was a case which did come in this year, and which will involve a payment that I quite forgot just now, of about 150*l.*, or something of that kind. That was owing to some of the men at one of the works not going in at the proper time. It was thought then that the case came under the subsidy regulations. Some members of the association scarcely thought that it did. Still it was decided that the matter should be supported in that way, and so the firm had a payment from the subsidy account. The subsidy arrangement was made before I went in the North of England, but the reason given for it was that it was found that the action of the union, which was very well organized at the time, was devoted mainly to dealing with one firm at a time, and it was felt that by working up the wages, by laying hold of wages that were higher perhaps in one case than in another, probably from some differences or other in the construction of the works, and by each of these firms being taken individually, the whole would be dealt with in time, and that the wages were thus being gradually worked up. This was a defensive movement in order to support the masters that were so attacked, and it was to be limited entirely to that purpose.

9414. (*Chairman.*) I think that the results of your attention to the questions between the employers and the workmen is embodied in the paper with which you have furnished the Commission, and which I hold in my hand?*—Yes, I thought that it would save a considerable amount of the time of the Commission if the general nature of the evidence which I was prepared to give were thrown into that particular form; and, moreover, it was desirable also, in order that it might be communicated to the several members of the association, for them to intimate whether they agreed with the general statements made in the printed evidence. Therefore, as it has been submitted to them, of course it may be given as representing their views.

9415. Having paid attention to the subject, and having framed this paper, you offer it to the Commission as containing your views upon the matter?—Yes; I would also say that in order that the views of the different members of the association might be quite independently laid before this Commission, if desirable, I obtained a number of copies of the questions which were issued by the Commission, and sent them to all the firms in the North of England, requesting that they would fill up those papers and return them to me. I only received four papers filled up in that way, but it is only fair, I think, to those firms that did send them to me that their answers should be handed in for the inspection of the Commission, if it is so required.

9416. (*Earl of Lichfield.*) I will ask a few questions upon the paper which you have put in. You state here that the trade "have never heard these organizations," referring to the unions of the men, "spoken of as Friendly Societies at all." We have been told by several of their representatives who have been here that they all combine friendly societies with them?—I am speaking of the ironworkers, simply of these three societies mentioned at the head of my paper, not of unions as a body. There are three unions which you have had before you, the Associated Ironworkers of Great Britain, the Staffordshire Millmen's Association, and what is generally called the Brierley Hill Union. Those are the unions to which I have referred, and I say, "The general experience "of the trade fully bears out the above statements as to "the objects of the Ironworkers' Union. They have "never heard these organizations spoken of as friendly "societies at all, nor have they any evidence that they "expend any of the funds, except payments for funerals, "on other than wages questions. In addition to this, "none of the balance sheets which have come to hand "contain any item for funeral allowance." I have not got all of the balance sheets no doubt, but still those that have come under my notice, published by the different unions, do not show any entries at all with respect to friendly societies.

9417. I see on the first page at the top of the third column that you say this: "The North Staffordshire "strike of 1865, and the North of England strike of "1866, were both undoubtedly prolonged, owing to "the interference of the London trades council." I merely wish to call your attention to the fact of that being a mistake, because the London trades council was decidedly opposed to the strike at the time as I know, for I had some communication with it myself. It was the London trades delegates represented by Mr. Potter who were supporting the strike in North Staffordshire?—Certainly there were some London trades under some organization or other that did so.

9418. (*Mr. Harrison to Mr. Allen.*) I believe this was the case. The manager of the "Beehive" newspaper sent round circulars to the various trade societies in London, and called a meeting of delegates. Delegates from certain societies in London went to that meeting, and at that meeting resolutions were drawn up, a committee was appointed, and subscriptions were ordered to be collected, was not that so?—Yes, that is quite correct. The notices which were sent out were simply sent to a few individuals known to the gentlemen connected with the "Beehive." Those parties met, and it was arranged that contributions should be received, and that the "Beehive" should be the medium of receiving them. While on the one hand the trade societies of London, as a rule, as well as the London trades council, recommended the men to accept the terms proposed by Lord Lichfield, they on the other hand recommended the reverse.

9419. (*Earl of Lichfield.*) But quite independently of that, the strike in North Staffordshire was not supported by the London trades unions in general?—Certainly not.

9420. It was by those trade delegates, or those who called themselves trade delegates. At the time one saw the account of the meetings, which were sometimes of the London trade delegates and sometimes of the London trades council, one also saw that the London trades council disapproved of that strike, and that the London trades delegates, whoever they may be, supported it?—Yes.

(*Witness.*) Will it answer the case if I substitute for those words these, "owing to the interference of "some persons who were said by themselves to repre-"sent in general the trades of London."

9421. (*Mr. Harrison.*) To represent those trades

* This paper will be found at p. 53.

Mr. J. Jones.
2 Nov. 1867.

in London who had come together in meeting for that purpose?—They did not put it in that way.

9422. (*Earl of Lichfield to the Witness.*) I see upon the same page that you refer to instances where the new men who were introduced into the district by certain firms were assaulted. Are you prepared to give us any evidence on that point?—Some of those assaults occurred in connexion with men who were taken on by Messrs. Fox, Head, and Company, and some men were committed to prison for those assaults. I could certainly get the particulars of the individual cases if desired.

9423. Where was that?—At Middlesbrough.

9424. When?— Soon after Messrs. Fox, Head, and Company commenced to work on their co-operative principle.

9425. At what date?—It would be about December last year.

9426. You say that it was at the time that Messrs. Fox, Head, and Company commenced to work upon their co-operative scheme?—Yes.

9427. (*Mr. Harrison.*) Was it proved that the men who were charged with the violence were all members of the union?—I really forget.

9428. Do you know whether they were labourers, or skilled workmen, or puddlers, or what?—I forget; they were ironworkers; they were puddlers, or something of that kind.

9429. Was there any evidence given to connect that outrage with the union?—None at all, that is to say, not to connect it with any premeditated action of the union.

9430. It was not suggested that it had been ordered by a secretary?—No, it is only stated in my paper as a fact that occurred, it is not meant to associate that with the union authorities, and I do not believe that it was so.

9431. Can you tell me what the circumstances were?—Some workmen that were taken on by Messrs. Fox, Head, and Company when they went into the town were assaulted, I believe, by some of the men that were out on strike, and the former applied for the protection of the police. Summonses were taken out, and the men were brought up before the magistrates and committed.

9432. (*Earl of Lichfield.*) You said that it was not brought home to the unions in any way?—No.

9433. (*Mr. Harrison.*) With respect to that case do you know whether it was a case of violence or a case of intimidation under the Combination Law?—I think if I recollect right that there was personal violence in one, at all events, of the cases. I believe that was so, but it is quite possible to get the newspaper reports. It is a matter of fact, that they were before the magistrates, and the other question could be easily settled. My impression is that in one case there was personal violence, and that the men applied for protection.

9434. (*Earl of Lichfield.*) At page 2 in the first column you say, with reference to the North Staffordshire strike, that "a circular, which had been issued "by the president of the northern union, found its "way into the newspapers about this time. This docu- "ment explained to the Scotch ironworkers that the "union authorities had resolved to call out the North "Staffordshire men, and that all other districts were "to support them." You refer there to the association of which Mr. Kane, I suppose, is president, and Mr. Kane is the person referred to?—Yes.

9435. Have you got that document, because we have understood from Mr. Kane that that strike was disapproved of by his association?—I have not got the circular, but I think that it can easily be procured. It was published in the newspapers at the time, and I have no doubt that it also appears in the union records.

9436. It stated, you say, that the North Staffordshire men had been called out?—Yes, I believe that is correct. It was a circular which was sent I understand by Mr. Kane; I was not fully conversant with the North of England view of that question, because at that time I was connected with the Staffordshire trade, and it was before I went to the North of England, but I remember the document perfectly well, and recolloect its being printed in the newspapers, and I also remember the terms of the document perfectly well. I say here, "This document explained to the Scotch ironworkers." It was written by Mr. Kane, it was addressed to the Scotch ironworkers, and it got into some of the Scotch papers, I believe; at all events it came into the hands of some of the North of England ironmasters, was by them printed, and then got into the papers generally.

9437. You have heard Mr. Kane's evidence to the effect that the strike was not sanctioned by his association; that would be inconsistent with the statement you make in your paper?—Not quite; I say "This "document explained to the Scotch ironworkers that "the union authorities;" it does not place the whole onus upon the union to which Mr. Kane belongs.

9438. The great point was "that all other districts were to support them"?—That it had been arranged as a union movement, the exact details I am not prepared to speak to.

9439. Perhaps you could lay your hand upon that document?—I will endeavour to get it.

9440. (*Earl of Lichfield.*) On page 2 at the top of the second column you must make the same alteration with regard to "the London Trades Council"?—Yes.

9441. Then a little further down on the second column on page 2 you refer to the loss in wages consequent upon the strike in North Staffordshire, and the lock-out in South Staffordshire?—Yes.

9442. In South Staffordshire you calculate the loss of wages to have been 150,000*l.*, and in North Staffordshire you calculate the loss of wages to have been 120,000*l.*; that represents the loss in actual wages during that time I understand?—According to my calculation.

9443. That is calculated upon the number of men out, and their earnings during that period?—Yes, at the wages current at that time.

9444. (*Mr. Roebuck.*) Provided they were employed all the time?—Yes.

9445. (*Mr. Mathews.*) That amount of wages would have been paid if there had been no disturbance?—Yes.

9446. (*Earl of Lichfield.*) Of course that represents nothing like the total loss to the wages in the district. You must take into consideration the amount of coal, for instance, that would have been raised and was not raised in consequence of the strike?—It only represents the direct loss of wages to the men employed in the forges and mills.

9447. But the indirect loss consequent upon any strike in the iron trade in actual wages must be very considerable?—Of course.

9448. It includes the wages of colliers and others employed in raising coals used in the ironworks?—Yes. I should think you might easily estimate it in this way; supposing you say, speaking roughly and without meaning to be exact, that the wages paid on the manufacture of iron would not be more than two parts out of five of the total amount of wages on a ton of iron, then there would be three-fifths more loss of wages if you take into account the coal and limestone, and the ironstone, and all other departments that are connected with the iron, that is assuming that 5*l.* represents the amount of wages on a ton of manufactured iron, taking every department, coal and everything that comes into consideration, then 2*l.* of that would be for the conversion of the iron from the pig iron into the manufactured article, and this calculation represents simply that 2*l.*

9449. (*Mr. Harrison.*) When the price is 7*l.* the wages are 5*l.*?—I should think that the price, even when iron is lower than that, would be more than 5*l.* I am assuming that as a rough calculation. I am supposing that the cost of wages on a ton of iron, now selling for from 6*l.* to 7*l.*, would be perhaps 5*l.* 10*s.* I assume in round numbers that it is 5*l.*,

and I know that the cost in the manufacturing department is at least 2*l.*

9450. That is five out of seven, is it not?—No, two out of five. I say that if you have a ton of manufactured iron the total amount that has been paid in one way or another in wages on that iron will be about 5*l.*

9451. And what will be the selling price of the whole?—Say 6*l.* 10*s.*

9452. I understood you briefly to say that the wages are three-fifths of the cost of the manufactured iron?—No; that the other wages lost would be three-fifths of the total amount of wages expended on a ton of iron. The Earl of Lichfield asked me what this calculation represented. I say that, taking Mr. Mathews's figures, there would be 5*l.* 10*s.*, in round numbers it would be 5*l.* for the total amount of wages. This amount which I have stated here represents only that part of the wages which is expended in converting the pig iron into manufactured iron, and that would be itself 2*l.* per ton. Consequently there is a margin of 3*l.* per ton for the manufacture of pig iron, getting the coal, and all these other things that are required to come into a calculation as to the total amount of wages in a ton of iron. Therefore, three-fifths of the total amount of wages are unrepresented in this statement of mine.

9453. (*Earl of Lichfield.*) In short, it comes to this, that for every 2*l.* actually lost of wages here there would be another 3*l.* in other departments?—Yes.

9454. (*Mr. Harrison.*) Do I rightly understand you that the wages in manufactured iron pay amount to 5*l.*, and that you are speaking of three-fifths the wages of the residue?—We are speaking now of the forges and mills. When the pig iron is taken into the forges and mills it is ready to be manufactured. Then before that iron goes out as a manufactured article, a cost of say 2*l.* per ton has been put upon it in wages, at the very least it would be that.

9455. I say, what is the cost price of that as a whole?—About 6*l.* 10*s.*

9456. 2*l.* has been expended in manufacturing iron, the cost price of which is 6*l.* 10*s.*?—Yes.

9457. Then the wages of manufacturing that iron amount to one-third of the whole?—Yes, from the pig iron, while you have to take into consideration the wages expended upon the fuel used, then you have to take the wages on the pig iron, and so on, and that makes up the balance 3*l.* more.

9458. (*Mr. Mathews.*) That is a rough estimate?—Yes, because different districts represent different figures, the charge in royalties for instance differs in different districts.

9459. (*Mr. Harrison.*) I think I understand you rightly in saying that the wages of manufacturing the pig iron into manufactured iron are so much, and then out of the cost of the whole pig iron three-fifths goes in wage?—Not quite that. In turning iron from pig iron into manufactured iron you take, in this 2*l.*, no account at all of anything but the wages paid in conversion, but then you have a great quantity of coal to be used, and there are many other matters used really embodying wages which would also have to be added, and thus 2*l.* does not represent the total cost of converting pig iron into manufactured iron. The cost of the coal for instance is mainly wages, but the wages alone paid to puddlers and all those other people in forges and mills would be about 2*l.* per ton of iron manufactured.

9460. (*Earl of Lichfield.*) That North Staffordshire strike was brought about by the puddlers alone?—Yes.

9461. What proportion of the whole number of persons losing their work for that period were represented by the puddlers?—There would be in the North Staffordshire district at that time about 800 puddlers, and the total number of ironworkers I should suppose, speaking roughly, would be 4,000.

9462. We have heard, and I believe that is so, is it not, that the millmen and other persons employed in those ironworks entirely disapproved of this strike?—Yes; I believe that that was true, that is to say, the millmen in the millmen's union.

9463. Therefore, really to support a strike brought about by the refusal of the puddlers alone to accept a reduction of wages which had been accepted by the whole of the rest of the trade in all other parts of the country, all these persons were thrown out of employment against their own will?—Quite so.

9464. I see that on page 3 you refer to the ironworkers having resisted the introduction of machinery upon one occasion. We have been told that there have been no instances of resistance to the introduction of machinery, and I certainly had never heard of any before. You say that they resisted the introduction of some mechanical puddling machines which were tried to be introduced?—That evidence I took from one of the journals of the ironworkers. I fancy it was in Scotland. It was stated in the journal that the men should have payment, if they worked these machines, at the rate of a full payment for six turns for working five heats. There was a case of complaint, and it was brought before the conference, and I recollect that in the evidence it was stated that the men should not work these machines unless the firm consented to give them six heats pay for five heats work.

9465. You cannot refer at this moment to the particular instance?—No.

9466. We have heard to-day something about the rate of wages at the works at Creusot in France, and at other works in France; can you tell us what is the average rate of wages earned by puddlers in this country now?—I may perhaps best answer that question by putting in a letter which I have received this morning, quite unsolicited on my part for I did not write for it, from the North of England. It just answers the question and also a portion of the evidence which was given by Mr. Kane the other day. This, as it happens, is a letter from Mr. Hopkins, the president of the Iron Manufacturers Association, who is one of the principal directors of a large firm at Middlesbrough. He says, at the end, "You may give it as evidence that can be sworn to," and therefore I imagine that this may be put in as evidence. I may say, as mentioned just now, that I simply wrote to inform Mr. Hopkins of the examination that had taken place here. I did think of writing for information to the North of England, but I felt that I had sufficient material by me to have given an answer to that question, though not in the same definite and convincing manner it which it is given here. He says, "I have gone carefully into the earnings of our "puddlers during the last 24 weeks. The net earn-"ings of several, after full allowance for under hands, "have been for the whole 24 weeks on an average of "1*l.* 15*s.* to 1*l.* 16*s.* per week. The forges in that "time worked 215 shifts or about nine shifts per "week, or 4½ shifts per puddler per week, so that the "average daily earning of these puddlers has been 8*s.* "per day net. Many more puddlers at our works "have averaged in the same way 1*l.* 13*s.* to 1*l.* 15*s.* "per week, and no one puddler need have earned less "than the latter amount had he liked. All this has "been taken out promiscuously in about 20 cases; "you may give it as evidence that can be sworn to."

9467. But before you draw any comparison between that rate of wages and the rate of wages given at Creusot, you must take into consideration the sums paid to the underhand. What are the helpers or underhand puddlers paid in the North of England?—I should say that as a rule they are paid about 3*s.* per day.

9468. They are paid by the puddler himself?—Yes.

9469. And only one is employed?—Only one.

9470. Can you speak with certainty as to what they pay them?—I have returns, and most of my returns state that before the late reduction the underhands were paid from 3*s.* to 3*s.* 6*d.* per day. I have not had returns just recently, but I believe they were

Mr. J. Jones.

22 Nov. 1867.

not reduced below 3*s*. In most instances I fancy that the puddlers are paying their underhands about 3*s*. a day at the present time, there may be some few cases where they are paying a little less.

9471. That letter which you have read states the actual amount of net earnings?—Net earnings after paying the underhand.

9472. But will you tell us what the puddlers receive per ton?—In this particular instance, I believe that taking their ordinary mixture of iron, the price would be 8*s*. For all grey, which is used for many purposes, the amount is 9*s*., but their ordinary mixture which they use would be 8*s*. They also give (which fact has sometimes been lost sight of) 5*s*. per fortnight to those workmen who work the full number of heats, and it is a custom to do this in many of the North of England works.

9473. What is the full number of heats?—59 per fortnight.

9474. If they work the 59 heats per fortnight they get an additional 5*s*.?—Yes, in most instances; it is not so in all cases, but it is in this instance, and it is in many others that I could name. In some cases also they have the custom of allowing the underhand some consideration for full work in the same manner.

9475. We have heard from some of the witnesses that great complaints are made on the part of the men in consequence of their treatment by some of the managers placed over these works by the employers. Have any instances come under your observation, where these complaints have been made to the employers by the men against the managers?—I have heard of cases of that kind.

9476. Are they cases that frequently arise?—It is quite natural that the manager of each department should frequently have disputes of various kinds with the men, and in some cases, as a matter of course, there are managers that are not judicious, and then the complaints may have considerable foundation.

9477. We have heard great complaints as against some of these managers. I want to know whether you know many instances where a complaint has been brought before the master in a proper way by those employed?—Those are questions which scarcely come under my notice, but I believe that such questions do arise, and that some managers are far from being infallible.

9478. Do you know whether there is such a thing as a managers association of any kind in existence?—I think there is one in North Staffordshire, but there is not one in the North of England.

9479. There is one in North Staffordshire you believe?—I believe so. I have heard that there is one.

9480. Do you know anybody connected with such an association?—No, I have merely heard casually that there was such an association.

9481. Could you get us the name of anybody connected with the association?—I think not.

9482. (*Mr. Hughes.*) Were you intimately acquainted with the facts of the 1863 strike to which you refer in this paper?—I was in Staffordshire at the time, but I was not intimately mixed up with that strike.

9483. At what period of the year did the improvement of which you speak in this paper begin to manifest itself?—If I recollect right, it was about May. I am speaking quite without book in this case, because it is a long time ago. I cannot recollect the exact period of the year.

9484. When did the agitation about the rise of wages begin?—It had begun sometime previously. I do not know exactly at what particular time.

9485. But you state here, "They then decided to make a movement for the advance of wages." That would seem to imply that it was after the better time came; but you say that that is not so?—"In 1863 an improvement began to be manifested."

9486. Then you say, "They then," that is after the improvement began, in the ordinary meaning of the English language?—It was in 1863. If the strike took place in the spring it would be some time during the earlier part of the year that this agitation was going on, and it assumed a tangible form some time in the spring.

9487. Before the good time came?—Before any declaration of advance had been made on the price of iron. Masters are always ready enough to advance the price of iron, as you are quite aware, if they can possibly do so.

9488. When was the first offer to raise wages made, or was there any offer made to raise wages?—There was no offer made, I think, to raise wages, because the plea was put in that there was no advance in the price of iron, and until there was an advance in the price of iron the masters declined to make any alteration in the wages. I am not very certain about this particular strike, but perhaps some gentleman from Staffordshire will be examined who was intimately associated with that strike. I was not; but I think that these are the correct facts, because they have been submitted to the gentleman in question, and he has passed them as correct facts.

9489. Then the result was that a rise in wages took place?—Quite so.

9490. Can you give us the date of that rise?—I think it was about the middle of the year. I have not got detailed information about this, but I believe it was about May or June.

9491. You should get detailed information, because here we have the facts stated one after another. You say, "This went on for about 14 weeks," and then you say, "The result was that the ironmasters advanced the price of iron." I ask you when the result came, and you say in the middle of 1863, but the strike had not begun then?—I say it was sometime in the spring; it is a question of months. I am not quite certain about the date. The strike begun 14 weeks before the price of iron was advanced.

9492. The impression I get from reading this document putting my interpretation upon the facts is, that there was no offer made by the masters to advance wages?—There was a second advance of wages; there was first of all an agitation on the part of the men, there was a strike, and then wages were advanced. The men's demands were conceded, and the price of iron was at the same time put up. Then shortly after that another pound was added to the price of iron, and wages at the same time were pushed up 10 per cent. by the masters on the advance of the price of iron.

9493. Without any demand on the part of the men?—Without any demand on the part of the men.

9494. The first rise came in consequence of the demand of the men?—Yes.

9495. The second did not, but was given without any demand?—Yes.

9496. (*Earl of Lichfield.*) Perhaps you will tell us what the scale of wages and prices upon which that rise took place had been?—Wages had always been régulated by the plan of allowing 1*s*. per ton for puddling, according to the price of iron, so that when iron was 7*l*. 10*s*. puddling would be 7*s*. 6*d*., and that was the scale adopted about that time.

9497. (*Mr. Merivale.*) Has the Ironmasters' Association, of which you are secretary, any written or printed rules?—Yes, they are here. I will put them in (*handing in the same*).

9498. How often do they meet, is that in their rules?—They have quarterly meetings. It is not mentioned in the rules, because it is a matter rather for trade purposes, a sort of market to compare prices. The members would meet under any circumstances if there was business.

9499. When they take a decision on the subject of The price of iron or the rate of wages, is that announced in any way?—I may say that in the North of England they publish no list of the price of iron.

9500. But the Midland Association do?—Yes, they quote prices every three months.

9501. What announcement do they give of those prices?—They are always given to the newspapers.

9502. The district papers?—Yes, the district papers fully report the next day what is done at the iron-masters' meetings.

9503. As to the rate of wages, did they decide that?—That decided itself, because if iron went up it was understood that wages were advanced, and if iron went down it was understood that that carried a reduction of wages.

9504. I want to ask you a few questions about another portion of your paper. In the first column you give certain extracts from the rules of the unions, and then you say, "The main object of the Iron-"workers Union is to force up wages to the highest "possible point, to encourage emigration with a view "to thin the home labour market, and to provide "funeral money for members and their wives. That "the object of encouraging emigration is simply to "thin the home labour market in order to raise wages "in this country irrespective of the fate of those "sent abroad, is clearly proved by the following ex-"tracts." Now, in your view, is the object of "thinning "the home labour market in order to raise wages in "this country" a bad one?—I do not say that it is a bad one, from the men's point of view. I simply state a fact.

9505. Without meaning us to infer that you disapprove of it?—Without expressing any opinion upon it; I simply state it as a fact.

9506. Did you not mean the inference to be drawn that it was a dangerous and bad thing?—It seems to me a bad thing if the emigration is to be encouraged irrespective of the fate of those sent out.

9507. But supposing that we look at it generally, without regard to the fate of those sent out, should you say that in itself it was a bad thing?—No, I should not say that in itself it was a bad thing; I should say that they would have the power of doing very little in that way to affect such a large interest as this.

9508. You quote these words, "by thinning the labour market you enhance the value of the British workman;" that is a doctrine which you condemn, I suppose?—No, I do not condemn it; I simply state that that is one of the objects, and that circular states that the union is formed for the encouragement of emigration. Now one would naturally infer that they would consider the benefit of those sent out, but it appears from this that the object in view all the while is simply to thin the labour market in order to enhance the value of the British workman; and I have shown in another part of my paper, by an appendix containing letters sent from Pittsburgh, the place to which some of these men from the North of England district went, that they had been entirely misled.

9509. I understand that you mention the objects of the Ironworkers Union which are stated in your paper in order to show the mischief of them, and that that is your purpose in coming here?—No, I simply came here to give evidence on the objects of the Iron-workers Union as I find them stated.

9510. And this statement of yours I am to take as being given without any *animus*, as lawyers say?—Quite so, because this was the view I took in preparing this paper, I could not tell who would have to come first, or how far the men would give evidence of the objects of their union, therefore I simply took publications that have come into my possession, and I took the questions which the Commission had issued and worked the answers out in connexion with the papers I had.

9511. Therefore I may the more freely ask you, in reference to this sentence, "by thinning the home labour market you enhance the value of the British workman," would not it be a very good thing in itself?—Yes.

9512. So far then, if it be one of the objects of the union to induce people to emigrate fairly, it would be doing good to the interests of the working class generally, and not harm?—Yes, looked at in itself, and up to a certain point.

9513. Of course I need not point out to you that when they got to a certain point the thing would defeat itself, because they would raise wages to such a point that they could not get work at all; but up to that point it would be doing good?—Yes.

9514. Now you have given some very strong instances here in which this advice of the unions has been followed by men going away to America and leaving their wives and children behind dependent upon the public. That I presume you, myself, and all would agree in thinking a great evil and a great abuse. But what class of men are those who are thus persuaded to leave their wives and families and go abroad; are they good workmen or bad? As a general rule, may I not safely say, that a man who takes the advice of a union and leaves his wife and children dependent on others is a shifty fellow at the best?—But I imagine tath these men were sent out, and that it was quite understood that they would send for their families to come after them. If persons go from Staffordshire to the North of England, it frequently happens that they go for a certain time, and they do not on speculation remove their families and break up their homes all at once. There are many cases I could mention where they go and stay there for sometime. I know that I myself did not move for sometime, and I should have thought it rather unwise to do so; and I think that the workmen act on pretty much the same principle.

9515. And those who go abroad, in the meantime leave their wives and families on the poor rate?—No. As I suppose these men took sufficient money with them from the union to pay their expenses out there, and were expected to send sufficient money home for their wives and children.

9516. Is there any evidence at all that they were likely to keep their wives and families at home when going out in that way?—I do not know that there is.

9517. Supposing these men to be really shifty and undependable men, are they men whom we are really to trust for a description of the true state of things in America?—I imagine that these are letters written to their friends, and therefore they do not come under the category of things written for a purpose; I think, therefore, that they are to be trusted in stating to their friends that they have been disappointed.

9518. Are they not a class of people pretty certain to be disappointed?—If these letters had been written for a public purpose I should say that they might be, but these are written to their friends, and in writing to their friends they would naturally state the case correctly.

9519. As they found it; but would that be the way in which honest, hardworking men would be likely to find it?—I have no further evidence from Pittsburgh about the state of things at that time, and therefore I cannot say. This was published in an extract from the "Beehive," that is to say, published by the men themselves; it seems, therefore, to have commended itself to the men that the case was correct.

9520. For instance, such information as that 10*s.* here goes as far as nine dollars in America?—I have further information which goes to show that that statement is tolerably correct; I may say that I saw the communication in the "Chicago Tribune," to which allusion has already been made in the examination of a previous witness. The argument was on the pauper labour question. A great deal had been said about the pauper labour of England, and about its being only by such labour that the English were able to undersell the Americans. This communication was written to refute that argument. It dealt with the iron and the woollen trade. In the iron trade the wages paid in the North of England were given, and it was stated that the wages in Staffordshire would be about 15 per cent. and in Wales about 40 per cent. below the wages in the North of England, The wages of the woollen workers were also given, and the article took this view, that the agricultural labourers were earning at that time on an average about 10*s.* a week, that the woollen workers were earning on an average about 20*s.* a week, and that the ironworkers at the

Mr. J. Jones.
22 Nov. 1867.

time these wages were referred to (that was in 1866), would be earning 30*s.* per week on the average, and it was assumed that the 10*s.* per week, on which the agricultural labourers as a class were generally subsisting, was certainly sufficient to draw them over the line which marks off paupers. Therefore the men in the woollen district were twice as well off, and had a margin of 10*s.* in their favour as compared with agricultural labourers, and in the iron districts they had a margin of 20*s.* Then the article went on to give the cost of living, the amount of rent to be paid, and of schooling and taxes, and everything that would come ordinarily into the expenses of a workman. Those were just given as facts in that article. The editor himself put a leading article in the same paper, stating that he had gone over those statistics, and he stated the reasons he had for sending to Europe for that information. The editor, I believe, is chairman of one of the free trade lodges there, and he stated that he had made a comparison between the position of the working men in that country (in the Chicago Ironworks I presume) and the position of the working man in England, and taking into consideration how far the money in England would go and how far the money in America would go, he made out that the English workman would be 33 per cent. better off than the American workman at the wages that were being paid at that time in the two districts. There was a letter in a further number of the paper from a Welsh puddler then at Chicago, calling in question the statements that were made, but in point of fact absolutely confirming them, because he pointed out that wages in Wales were 40 or 50 per cent. lower than those that had been given in the article in question, he evidently having overlooked the statement made in that article, that wages at that time in Wales were 40 per cent. lower than they were as quoted in the North of England. In the printed paper before you I have stated that the president of the Ironworkers Union had advised very strongly that the emigration scheme should be supported, and I simply brought those letters in as evidence which appeared to show that the unions were sending these people regardless of the circumstances on the other side.

9521. (*Earl of Lichfield.*) You say here, "That the "object of encouraging emigration is simply to thin "the home labour market in order to raise wages in "this country irrespective of the fate of those sent "abroad"?—Quite so.

9522. And you insert those letters to substantiate that argument that you made use of?—Yes.

9523. (*Mr. Booth.*) Those letters you found in the "Beehive"?—Yes, published in the paper of the men, and therefore it could not be supposed to have any bias on the part of the masters. It was on that that I based the statement I make, that they evidently had been encouraging emigration, perhaps without knowing what the state of things was on the other side, or taking sufficient pains to inquire as to the prospects of these men when they went out there, but the fact remains that a great number of them were discontented.

9524. (*Mr. Harrison.*) It comes to this, that the union sent out 20 men, and that five returned?—Yes, according to Mr. Hobson's explanation.

9525. (*Lord Elcho.*) Supposing that the officers of the union, who are consulted by the men and who advise the men on these matters of strikes, wished to ascertain the exact state of trade, and how far masters at their meetings are justified in announcing a reduction of wages, would they have any means of finding that knowledge; are there any documents or any other means by which they can obtain such information?—There are papers published which are recognized by the trade; I do not mean by people connected with the iron trade simply, but by people connected with trade in general. Quotations of prices of iron appear in the "Mining Journal," in the "Engineer," and from time to time in the "Colliery Guardian;" in addition to which there are two special iron trade papers, one, of which I am the editor, being published on the North of England but applying to the whole country, and the other being published in Birmingham. Those might, perhaps, be taken by the men as interested to some extent and might not be believed, but there are general papers published in London which give the current prices of metals.

9526. But I presume that the information and the knowledge which lead the ironmasters to announce a reduction of wages are not within the reach of the officers of unions?—Yes, those things cast their shadows long before. Every Monday in the "Times" there appears a paragraph which under the head of all the leading iron trade centres gives the state of trade in those places, and when trade is bad it is to be gathered from the reports which appear in the papers from parties residing in the particular districts; so that everybody, the public in general, can tell when the trade is depressed and when it is good.

9527. Then your opinion is that a person in the position of the secretary of a union, who naturally ought to be conversant with all the information that is obtainable on such points, would be able to acquire sufficient knowledge to enable him to advise the men as to whether a reduction in the rate of wages was or was not justifiable under the circumstances of the trade at the time?—Yes; he might (as I believe the men in the North of England did) form wrong conclusions, for instance, from the state of the export trade. Although as was mentioned the other day the export returns for last year showed an improvement as compared with the exports of the previous year, yet it was the wonderful falling off in the home trade, in the trade connected with the renewing of the home railways, and so on, that caused such an immense depression in the iron trade; so that their inference, which would have been quite fairly drawn without taking into consideration the home trade, led them astray; they concluded that because the export returns were favourable therefore the iron trade must be in a favourable condition, but they overlooked the fact that the home trade was paralyzed.

9528. Do you believe that the secretaries of these unions do endeavour to acquire such information, and to advise the men with the knowledge which they ought to have on these questions?—I cannot speak from any knowledge on that point. I should imagine that they would use these facts to the best of their ability, but I daresay that sometimes they overlook such matters as I have mentioned, owing to their not being sufficiently acquainted with the general bearings of the whole trade.

9529. Must there not be matters connected with previously existing contracts before a rise or fall which might influence the action of the masters, but which these trade circulars and newspapers which you have referred to, and the other sources of information open to the men might not give them any knowledge of?—That is not quite the case, for it is generally known when there is a large contract in the market. For instance, there was a large contract in the market last week for 14,000 tons of iron for Indian railways that was adjudicated last Thursday, and I have seen it stated in several of the newspapers that it was taken by two South Wales firms (I need not mention their names here), and not a single ton of it has come into the North of England. Those are facts not exclusively stated in the trade papers, but also in the public papers. Then, for instance, as to contracts recently running in the North of England district, it was known that the Russian contracts had been taken and that they must be completed by a certain time; indeed, the principal facts about the trade really ooze out very generally as to all these large contracts, so that the secretaries of the trades unions have very good opportunities of getting information on those points.

9530. (*Mr. Mathews.*) That is to say, in the case of large contracts?—Yes.

9531. In the case of the ordinary mercantile iron, bar iron, hoops and plates, and so on, are there any

means which the workmen have of getting at the actual truth except from communication with their masters?—I think not.

9532. (*Lord Elcho.*) If there are not those means open to the workmen, and the information can only be got by communication with the masters, does not that fact rather point to establishing as much as possible that intercommunication between employers and employed?—That information is given to a great extent in the quotations in the papers. The cost of things must be measured by the demand; and, therefore, those prices which are quoted, as long as they are given to the general trade, I imagine could be taken as reliable without the men consulting the masters.

9533. I mean with a view to avoiding disputes in matters of wages; as for instance, when you see it stated in circulars issued by the unions that the masters are proposing reductions which are not justified. If that information can only be got from the masters, does not that show that there should be the means of intercommunication between employers and employed?—I think that the masters are always ready to see their men upon those points. Indeed, I believe that the North of England notice now posted up states that the masters will be quite ready to give them further information as to the reasons for the step which they have taken.

9534. From your knowledge of the views and conduct of the masters in all these matters, do you think that any objection would be taken by the employers to establishing in this country something like those courts of arbitration, or councils of conciliation as they are called, which exist abroad?—I have no knowledge of the councils of conciliation. The ordinary idea of arbitration is evidently out of the question, for the simple reason that the masters would close their works if the decision of the arbitrator were such as to compel them to work at a greater loss than would be involved in closing the works. It does not follow that by closing the works all expenses cease. Taking all kinds of standing expenses, depreciation of machinery, and payment of all standing charges, and rates and taxes, there is a sum amounting from 7*s.* 6*d.* to 10*s.* per ton loss involved in closing the works.

9535. (*Mr. Harrison.*) Does that include plant and rent?—Depreciation of machinery, and so on.

9536. Does that include the value of the ground for instance?—Yes, it would include the charge on that; it amounts in all to 10*s.* per ton on the iron.

9537. On the selling price of bar iron?—Yes; that is to say, it has been stated to me by one firm that they made it out to be about 10*s.* per ton; of course it would be different in different works. Supposing that such a firm could take a contract at 7*s.* 6*d.* a ton loss, knowing that they would lose 7*s.* 6*d.* on every ton made, still it would answer their purpose to take that contract rather than let their works stand idle, for the simple reason that they would be losing 10*s.* per ton in the latter case, which would be 2*s.* 6*d.* a ton more than they would be losing in the former case. I could point to very large contracts now in which it is absolutely certain that there is a loss to the employers; at the present time the cost of manufacture is at least 5*s.* per ton more than what they receive at the other end. But it is accounted for in this way, if they ceased altogether there would be a loss of 10*s.* a ton.

9538. Can you say whether such a fact as that which you have just mentioned is generally known to the employed?—That is one of the things which they do not give their attention to, but if they were really to consider the matter they would soon find it out. As far as that is concerned, the trade look with some interest to the establishment of co-operative ironworks in the North of England, because it will afford a means by which the men will be able to ascertain all those things for themselves.

9539. (*Earl of Lichfield.*) How long have they been established?—They were established sometime about the beginning of this year, but they are not in operation at present.

Mr. J. Jones.
22 Nov. 1867.

(*Mr. Millington.*) As I may not have another opportunity of doing so, I wish to correct some of Mr. Jones's statements now. In the first place, Mr. Jones states that one of the objects of our associations is to pay funeral donations, but he has not seen any in either of the balance sheets. I wish to explain that. The various branches of the association pay each their own funeral donation, and, therefore, they are published in the local branch balance sheets and not in the general balance sheet; therefore, the evidence of Mr. Jones on that point is of no importance. The next point is, respecting the statement that the men receive 8*s.* per ton in the North of England, and that their average wages have been 35*s.* per week; I will show you how that is an impossibility. Six heats per turn, at 4¼ cwt. per heat, will yield upon the average 24 cwt. This amount at 8*s.* per ton will bring the puddler 9*s.* 7¼*d.* per day, and when, according to Mr. Jones's evidence, the forehand has paid out of that 3*s.* per day for his underhand's wages, he will have left 6*s.* 7¼*d.* Now considering, as is always the case, that a forehand pays an extra day's work to his underhand, that will bring the forehand's wages in full to 30*s.* per week, supposing him to work full time. Now I can assure you that I know of no work in the North of England which has worked more than two and a half or three turns per week, with the exception of the Tees-side works.

The following is the statement handed in by the witness, which is referred to in question 9414:

OBJECTS OF THE IRONWORKERS' UNION.

The ironworkers have two organisations. The National Amalgamated Association of Ironworkers has its headquarters at Gateshead. The Associated Ironworkers of Great Britain have their central offices at Brierley Hill. In Staffordshire there is also a Millmen's Union, distinct from the forgemen connected with the Brierley Hill executive, and having its offices at West Bromwich.* In the following statement, these three organisations will be referred to as the Gateshead Union, the Brierley Hill Union, and the Millmen's Union. In the preamble to the rules of the Brierley Hill Union we find the following given as the objects of the society:—

"The object of this association is to raise from time to time, by contributions among the members thereof, funds for the purpose of mutual support in case of strikes, emigration, and for the burial of the members and their wives."

In the preface to these rules we read:—

"The necessity and advantages of combination are so universally felt as scarcely to require one word of commendation. By combination, the working man is enabled to obtain a higher rate of remuneration for his labour; and by constantly associating together, feelings of friendship and unanimity will be the result; we shall get to understand that the interest of the one is the interest of all; and by comparing our own position with the position of those who have no such combination, we shall quickly perceive its value."

In the rules of the Gateshead Union it is asserted,

"That so far as the plan of action between the two "executives (north and south) is concerned, the executive "power to be one in sentiment, one in policy, and one in "action;" hence the objects set forth by the Brierley Hill Union may be taken as representing both organisations. The revised rules state "the objects of the association shall "be to obtain by fair and constitutional means, an "adequate remuneration to the members for their labour; "to secure the rights of the members in all questions "affecting their interests; and to afford mutual protection "and assistance to individual members as necessity may "require." The objects of the Millmen's Association are thus stated: "The protection of the interests of its mem-"bers against oppression; to enable them to secure a just "remuneration for their labour, and maintain a fair "regulation of wages throughout the trade."

As indicated in the above extracts, the main object of the Ironworkers' union is to force up wages to the highest possible point, to encourage emigration with a view to thin the home labour market, and to provide funeral money for members and their wives. That the object of encouraging emigration is simply to thin the home labour market in order to raise wages in this country, irrespective of the fate

* See correction subsequently substituted, answer 9821.

Mr. J. Jones.

22 Nov. 1867.

of those sent abroad, is clearly proved by the following extracts from a circular of President Kane, issued to the members on the 1st February 1865:—

"Our opinion is this, that it would be more desirable to "adopt the following plan than the policy which we have "carried out in the past: Instead of exhausting our funds "on strikes and defending ourselves against the tyrannical "conduct of the employers, as manifested in what is be- "coming quite a common practice—viz., lock-outs, we "would advise the workmen to put up with grievances, "rally round the standard of union, pay their money, but "not grudgingly, so that we may be enabled, with your "approval, to carry out an extensive scheme of emigration. "By thinning the labour market you enhance the value of "the British workman. Where there are three at present "let there only be two, and employers will soon be brought "to their senses." The Brierley Hill executive, at their conference in 1865, expressed views much similar to the above.

The general experience of the trade fully bears out the above statements as to the objects of the Ironworkers' Union. They have never heard these organisations spoken of as friendly societies at all; nor have they any evidence that they expend any of the funds, except payments for funerals, on other than wages questions. In addition to this, none of the balance sheets which have come to hand contain any item for funeral allowance.

The union has tended to separate employers and employed and to destroy the individuality of the workmen. In case of strikes, individual workmen, and, in many instances, whole bodies of men, have been prohibited from speaking, to their employers or their agents; have been bound never to go within several hundreds of yards of the works; and have been heavily fined for merely speaking to a master. Instances in support of the above occurred in connexion with the North Staffordshire strike of 1865. A man was fined 10*s.* because he spoke to his master when the latter asked if the men at the works would appoint a representative to meet the masters in conference.

The union is said to have raised wages in the iron trade, but this is not the case to any marked extent, if we look over a considerable period. Wages in this branch have for many years been regulated, in most districts, by a rough sliding scale based upon the selling price of iron; so that without the action of a union the men experienced an immediate benefit when trade was good, and generally submitted without dispute when prices went down. Had this system alone been followed, and had no strikes occurred owing to wages disputes (originating with the union authorities) the aggregate earnings of the men for the last five years would undoubtedly have been quite equal to, if not greater, than the amount actually obtained. If the sums paid by the men in support of union movements—often reaching 2*s.* or 3*s.* per week—were also deducted from the actual earnings, the advantage would be clearly against the union.

In the matter of wages the principal adopted has been to take the highest rate paid in any place in any department, and to make this the country price, without reference to the special circumstances which may render an exceptional payment in certain places only reasonable.

At a delegate meeting it was urged "that they should "take a decided stand against all reductions, and do to the "utmost of their ability to maintain the highest prices, and "endeavour to bring up the lowest to them. It was ulti- "mately resolved, that the association take a decided stand "against all reductions."

With respect to the employment of non-union men, frequent instances have occurred in which the unionists declined to work unless certain men were either discharged or compelled to join the union. Though the employers have generally declined to interfere directly in these matters, it mostly happens that the strong pressure which the workmen bring to bear compels non-unionists to either leave their job or become unionists. The rules contain the following with reference to non-union men:—

"That no member of this association shall be allowed to render any assistance to non-unionists. Neither shall any member send for, or by any means procure, a situation for any such *obnoxious* workman. Any member disregarding this rule will be fined 5*s.*, or be dealt with as the committee may determine."

The above rule brands those who do not choose to be unionists as "obnoxious" workmen, whatever their character or ability may be.

The policy of the union has been on the whole detrimental to the interests of the ironworkers, as previously stated. As far as the employers are concerned it is not easy to define the effects. There is every reason to believe, however, that many failures have occurred owing to the exorbitant demands of the men and the consequent strikes; also that British merchants have sent orders abroad which would have been executed at home were it not for the uncertainty of getting the work punctually performed. The increase in continental ironworks has been stimulated by the knowledge that our labour market was so frequently unsettled, and our wages so high. Prussian and other continental papers have frequently alluded to this, and advised the extension of their ironworks. All departments of trade depending upon the iron trade have suffered from the effects of the ironworkers policy, as the frequent suspension of operations has acted most injuriously upon tradesmen; but in the end these people calculate the chances of strikes, and accordingly allow a wider margin for profit, which has ultimately to come out of the earnings of the men.

Amalgamation of Unions.

Though there is no definite organization by which the various trades' unions of the country are bound together, there is always a tacit understanding to pull together, and in case of an extensive strike in any department of industry other branches seldom decline to give their support to the men on strike. The ultimate effect of this is to make labour disputes much more protracted in character, and hence to produce more distress to the operatives and greater loss to the masters. If the men affected by a particular strike were left to themselves they would know their resources would at any time be able to calculate their chance of success, and the struggle would mostly be of short duration; but when they are expecting help from various unions throughout the country they are buoyed up with a false hope, and are led to be more obstinate in their adherence to the position they have taken up. Attempts have been made to establish international unions, but at present no particular success seems to have attended the movement. The ironworkers are said to have sent representatives from several lodges in Belgium, with the view of stirring up the men there to agitate for higher wages; but they do not seem to have been successful.

By a trades' council we understand a council composed of delegates from different trades, and such an organization naturally acts prejudicially to the interests of masters and men. In this way the onus of deciding questions, involving many technical details, is thrown upon workmen unacquainted with the industry in which the dispute has occurred; and not being possessed of any special judicial qualifications, they are not likely to sift the evidence nearly so well as would a body of experts; consequently their decisions are mostly unsatisfactory for their clients, and more than ordinarily injurious to the interests of the employers.

The North Staffordshire strike of 1865, and the North of England strike of 1866, were both undoubtedly prolonged, owing to the interference of the London Trades' Council,* and the blunders and mis-statements which they circulated on the matters in dispute. Even were their intentions thoroughly honest, their ignorance of the iron trade, which is particularly complicated as far as wages are concerned, would prevent their understanding the points is dispute.

Effect on the Rate of Wages.

The policy of the ironworkers' unions, as far as wages are concerned, has been already alluded to, and also the effect which this policy has had upon the rate of wages. In proof of this it may be stated that wages in all the iron making districts are now almost as low as they have been known to be during the last few years, though the union organizations have never been more prominent than they have during the last five years. The rapid development of the iron manufacture about three years ago caused an unusual demand for men, and some derangement of the old principle of payment then took place, and altogether wages are now slightly higher than the standard formerly adopted. On the other hand there have been four or five extensive and protracted strikes during the period referred to, and the union contributions would more than reduce the present wages to the lowest point they have ever touched in the iron trade. Uniformity in rate of wages, irrespective of the skill or merits of individual workmen, has a most injurious tendency, as it destroys emulation, and reduces all workmen to a dead level. It seems one of the main objects of the union to secure this by levelling upwards. It has not been found that wages in the iron trade have been rendered more equable owing to the action of trades' unions. There are many disparities between the several districts, and the union has signally failed in carrying anything like uniformity. The ironworkers' union does not appear to take any prominent part in transferring labour from one district to

* See correction subsequently substituted, answer 9420-1.

another. When workmen proceed from one part of the country to another in search of employment, the rules of the union provide that they shall not visit employers, but shall consult the local unions, and shall produce their credentials from the lodge to which they last belonged. If they are non-union men no assistance is afforded them. In cases of strike, when men come in from other districts, the strongest efforts are made to send them back, and to prevent them from working. There is a most marked difference between the treatment of a union and non-union man by the unionists. The "black-legs," as they are termed, are made as uncomfortable as possible by moral intimidation; and instances are of frequent occurrence where physical intimidation has been resorted to. Instances of this occurred in the late strikes, where the new men introduced into the district by certain firms were assaulted. Several individuals were committed to prison for such assaults.

Strikes and Lock-outs.

The principal disputes which have led to a suspension of work in different iron manufacturing centres, since 1860, are the following:—

1. The Staffordshire strike, 1863.
2. The Leeds lock-out, 1864.
3. The North Staffordshire strike, 1865.
4. The Mersey Iron and Steel Co.'s strike, 1866.
5. The North Country strikes, 1866.

1. After the depression of 1857, the iron trade was very quiet for some years, but in 1863 an improvement began to be manifested. The Staffordshire men established a union, and took great care to make the organization as complete as possible. They then decided to make a movement for the advance of wages, though no change had taken place in the official quotations of iron; and it had, up to this time, been always customary to let wages advance and recede according to the official list prices of iron, as fixed at the masters' quarterly meetings. The plan adopted by the union was to avoid a general strike, but to put out a few works for an advance, the other men meanwhile contributing to the support of those on strike. When this line of action became known to the masters, they endeavoured to frustrate the policy of the puddlers by supplying "puddled bars" to the mills where the men were not working. This went on for about 14 weeks; but the arrangement about the puddled bars did not work satisfactorily, especially as a sudden improvement in trade took place, and the works became fully occupied. The result was that the ironmasters advanced the price of iron, and gave the men the wages which had been demanded three months before. So rapidly did things improve, that this advance of iron was almost immediately followed by another, and for some time there was a general activity and prosperity in the iron trade. The men having succeeded in their demands, being aided mainly by the unexpected improvement in the demand for iron, attributed their success solely to the operation of the union, and at once set themselves to consolidate and extend the organization, until they made it a national union.

2. Not many months after the termination of the Staffordshire strike, the union made some objectionable demand in connexion with one of the firms in the Leeds district. The men also insisted that all the hands employed should belong to the union. The firms in the district resisted this, and combined together to close their works except to non-union men. They agreed that a declaration should be signed by every workman, pledging himself not to belong to a union, or to interfere with the liberty of masters or men. The union exerted all their power to resist this; but after spending upwards of 17,000*l.*, and, being idle for 27 weeks, the men gave in, and have never belonged to a union since. The strike was mainly broken up by the introduction of foreign workmen imported by the masters.

3. The exceptionally prosperous state of the iron trade did not last for any length of time; and hence, about the end of December 1864, the masters of North and South Staffordshire, Sheffield, Derbyshire, and the North of England, met together and decided to give simultaneous notice of reduction of wages, equal to 10 per cent. This course of action had never been previously adopted; but the policy of the union compelled the masters to make a joint movement, as it was felt that if one district struck the others would be able to support the men thrown out of work, and it would be very difficult to carry the reduction under such circumstances. It should be mentioned here that the masters had never before attempted any simultaneous action with regard to wages questions; but, as the men had established their National Association of Ironworkers, it was felt that the extensive combination of the men could only be effectively met by a general agreement amongst the ironmasters of the country. The notices for reduction were given simultaneously throughout the above-named districts. Before the notices expired, the men in Staffordshire, the North of England, and other places, had meetings, and it was announced that as they felt there was considerable depression in the trade, they had resolved to accept the reduced wages offered by the masters. Thus, it was thought, that the matter had been quietly disposed of. It soon turned out, however, that the North Staffordshire men declined to accept the reduction, and a strike ensued in that locality. A circular, which had been issued by the president of the northern union, found its way into the newspapers about this time. This document explained to the Scotch ironworkers that the union authorities had resolved to call out the North Staffordshire men, and that all other districts were to support them. As the strike in North Staffordshire thus turned out to be a union movement, the masters of the other districts gave notice that if the men did not return to work at the terms acceded to in other places, they would close their works at the expiration of a fortnight. This notice was carried into effect, as the North Staffordshire men did not show any willingness to return to work. Soon after the mills were closed, the union executives, both north and south, stated that they had advised the men on strike to return to work, but that they refused to do so. The Earl of Lichfield was called in, and requested to act as arbitrator in the case. The masters agreed to leave themselves in his lordship's hands; but the men declined to agree to the proposal, and so the strike went on. In the North of England the union authorities proposed to break off their connexion with Staffordshire, provided the masters would also sever their connexion with the masters of other districts, and would re-open their works. Several conferences between the masters and delegates from the men were held, the final one being on 27th March 1866. The following document was handed in to the masters, signed by the officers of the union and by a number of delegates, representing all the north country districts:—

"We, the delegates representing the various ironworkers in the North of England, do hereby honestly and sincerely declare on behalf of our constituents, that the following resolution has been passed in our respective lodges.

"Resolved—In compliance with the order of the executive, we hereby pledge ourselves to withhold all support from the North Stafford men, either directly or indirectly, during the continuance of the present dispute between them and their employers; and we further pledge ourseives to sever all communications between our union and those of North and South Staffordshire."

After this the mills in the North of England were re-opened, and some confidence was felt in the prospect of a better understanding between masters and men in the future. Meanwhile the strike in North Staffordshire continued, and the masters finding that their men declined to obey the instructions of the union, liberated the other masters from their obligation to close their works, and thus the strike became confined to the North Staffordshire district. It lingered on for some time—about five months' altogether—as Mr. George Potter, of the London Trades' Council, came down, and advised the men to continue their resistance, promising them liberal support from the London trades. Several meetings were held on the subject in London, and the facts of the case were very considerably mis-stated; so much so that the Earl of Lichfield felt called upon to attend one of the meetings and give a correct explanation of the proceedings as far as the arbitration question was concerned. A portion of the trades' delegates appear to have been much dissatisfied with the manner in which Mr. Potter acted on this occasion, and not long afterwards withdrew from the organization with which he was connected. The help obtained from London and elsewhere was only nominal, and the men on strike were reduced to great distress. At length they returned to work; but several of the masters declined to re-open their mills except on non-union principles. The men, however, assented, and have gone on working quietly since the close of this strike. The South Staffordshire works were closed for five weeks, representing a loss in wages of about 150,000*l.* The North Staffordshire mills were idle about twenty-one weeks, representing a loss in wages of about 120,000*l.* The mills in the North and other parts of England were closed from two to three weeks, representing about 50,000*l.* loss in wages. The North Staffordshire men returned to work at the wages originally proposed by the masters.

4. In May, 1866, the men in the employment of the Mersey Iron and Steel Company struck work, on the advice of the union, and a long strike ensued; but after being out for about twelve weeks the men resumed on the masters' terms, and also signed a rigid agreement pledging themselves to give up the union.

5. In the North of England a constant series of disputes occurred from the time of the lock-out onwards. These

Mr. J. Jones.

22 Nov. 1867.

mainly resulted from the attempts of the union to force up prices to the level of the highest paid in any part of the district, though the circumstances of the respective works are so different as to fully explain varieties in the rates for the same kind of work.

In the spring of 1866, the Cleveland pig iron trade was considered in a very prosperous condition, and prices improved; though it turned out that this apparent briskness of trade resulted from speculative operations in the Glasgow market, and ultimately great losses were incurred by the ironmasters on the transactions which took place about this time. The ironmasters, however, had heavy contracts on hand; and would have incurred much loss had they failed to carry these out properly. It was at this time that the blast furnace men, who are merely labourers, and in the majority of departments require no special training, gave notice for an advance of wages, varying from 10 per cent. to 80 and 100 per cent.; and also that they should in future be paid irrespective of the quality of iron produced. The advance of wages demanded was conceded after a good deal of negotiation. Soon after this the financial crisis brought great depression in all departments of the iron trade; and in June the masters intimated to the men that they should reduce wages 10 per cent. The notices were given to expire on the 28th July; and as the men refused to work at the reduction, the greater number of the Cleveland furnaces were damped down—that is, were filled with coke, or were blown out. After a month's idleness work was resumed on the master's terms, and in many cases the reduction was much more than 10 per cent. originally proposed. By this strike nearly 3,000 men were thrown out of work for a month; and as a considerable number of the furnaces were blown out, and have not since been worked, many men were thrown out of employment, and have since been unable to find work in connexion with the blast furnaces. The details of this strike are appended in the evidence given by Messrs. Gilkes, Wilson, Pease, and Co.

The iron manufacturers also gave notice to reduce the wages in forges and rolling mills. These notices expired on 14th July, when the works were closed, as the men, acting on the instructions of their leaders, declined to accept the reduction. The men appear to have been in communication with Staffordshire, and to have received promises of support from that district. Indeed, notwithstanding their pledge to the contrary, the Gateshead executive placed itself in communication with South Staffordshire almost immediately after the withdrawal of the lock-out in the north in 1865. This is proved by a correspondence which took place between the masters' association and the northern union, and by the published proceedings of the two unions. This connexion seems to have been kept up, and to have been much the same as it was before the men entered into their agreement to sever themselves from other districts. The masters based their notice for reduction on the depression of trade, and the consequent decrease in prices throughout the North of England district. The men replied that they would rather work short time than be put on lower wages; that no reduction had taken place in the South Staffordshire official quotations; and that, in short, things were not so bad as represented. The answer to these statements was, that to work mills and forges half-time would increase the cost of the iron very much, owing to the waste of fuel and standing charges; that though no reduction had taken place in the official quotations in Staffordshire, the masters there were selling at prices very much under the list rates; and further, that the North of England had never been guided by the prices of iron in Staffordshire; and that they would rather keep their mills idle than pay the former rate of wages. The strike lasted about five months, and ended in the men returning to work at rates of reduction much greater than was indicated in the original notice. The London trades promised assistance in this case, and sent altogether about 700*l.*, and the unions at Brierley Hill and West Bromwich also sent considerable sums. The London Working Men's Association suggested referring the matter to arbitration; but the masters declined on the ground that it was not a subject which admitted of being settled by this mode. About 12,000 men were out of work for 20 weeks, and owing to increased depression of trade, have since had to submit to a further reduction of 10 per cent., and have only had partial employment on these terms.

A few of the more prominent incidents in this strike may be mentioned.

For many weeks the men, apparently acting on instructions, rigidly kept away from their respective works, and held no communication with the masters.

A fortnight after the strike had commenced, the union issued an appeal to the members of trades' unions in England, Scotland, and Wales, and to the public generally. In this appeal it was stated that the masters of the North of England had planned a conspiracy against the workmen and their families more cruel than the children of Israel suffered from Egyptian bondage. The union officers affirm that during the previous four years they had expended 17,000*l.* in defending the trade. They call upon the trades' unionists for aid in resisting the unjustifiable and indefensible demand of the masters. They specially appeal to the men in South Staffordshire, and refer to the assistance which Brierley Hill received from the north in 1863. This appeal, also, was directed to the London trades' organisation. The London Working Men's Association took up the subject, but urged the men first to agree to submit the matter to arbitration. This, as before mentioned, was declined by the masters, and a meeting was held in London, in order to hear the case of the ironworkers. The result was that the association opened a subscription list, and made very hearty promises of assistance. About this time a brief statement of the facts connected with the strike was published by the masters, and this led to a correspondence of some length, in which it was demonstrated that the London Working Men's Association knew very little about the iron trade, and that it was not an authority likely to bring the dispute to a settlement. Communications were opened up by the men with South Staffordshire, and a proposal was made for an amalgamation of the two districts. After several meetings, the Staffordshire men declined to agree to the proposal, but considerable sums of money were voted in aid of the men on strike. About the end of September about 2,000 men (those employed by the Consett Company) gave in and accepted the reduction. They appear also to have left the union altogether, and exhibited great hostility towards the president of the union, Mr. Kane, who had difficulty in escaping safely from the place.* Several gentlemen who took an active part in inducing the men to return to work received threatening letters. The funds divided to the union men on strike did not average more than from 2*s.* 6*d.* to 3*s.* per week, sometimes more and sometimes less. Of the means used to keep the men together and to maintain the struggle, there is not much to say, as they were the usual methods. The strongest possible pressure was brought to bear upon the members. Every effort was made to put the matter in a false and favourable light before the public; frequent meetings, often public, were held, but gradually one lodge after another gave way, until all had accepted the reduced and revised terms proposed, and which were as nearly uniform for the whole district as it was found possible to make them.

In several of the iron trade strikes, many new men have been introduced. In the Leeds case, Belgian men were brought over and continue to work there. In the last strikes in the North men were introduced from other districts. The number of hands driven out of the iron trade in this district has been considerable. The result of these strikes to the masters was the loss of contracts and the cancelling of orders, as the uncertainty of execution led buyers to send their orders elsewhere. As a general rule, the men on strike received a tolerable allowance for the first few weeks of a strike, but afterwards only a few shillings per week, and frequently nothing at all. These allowances were obtained from their own union, from other trade societies, and from subscriptions.

In most of the strikes above referred to several of the leading union men have not been taken back to work by their previous employers. This has frequently arisen from the fact that the leaders were the last to give in to the masters' terms, and before they expressed themselves as ready to work other men had stepped in and filled their places. One effect of the strikes was to afford an opportunity for the less skilful men to advance to higher positions, which they retained when the union men came to work, and hence many of the experienced hands was compelled to take subordinate places, or lost certain advantages which they had previously enjoyed; but this arose naturally, and without any special arrangement or design on the part of the employers or their agents.

Great depression was produced amongst the general trades in all the districts depending mainly upon the iron manufacture for their support. The amount of money which would, under ordinary circumstances, have been paid away in wages, was stopped from circulating, thus causing considerable interference with all branches of industry.

None of the strikes alluded to secured a permanent wages standard. The advance secured by the Staffordshire strike would have come naturally in a few weeks after it was actually secured, as the improvement in trade would have rendered necessary a rise of 20*s.* per ton on the price of iron at the next quarterly meeting, and this would have carried with it an advance of wages equal to that secured by the strike. The strikes against reduction have been ineffectual, and the result has generally been that the men

*This statement was subsequently withdrawn. See answer 9821.

have had to go to work on less advantageous terms than those against which they struck in the first instance; nor have strikes proved any obstruction to further reductions when trade continued bad.

One feature in connexion with the ironworkers' strikes deserves particular attention. The number of union men who conducted any strike was only a small proportion of the total number of hands affected by the strike. In the North of England case, on the authority of the men, there were 3,000 union hands affected, though there is reason to believe that this number was very much over-stated. The total number of hands thrown out of work directly by the strike, was above 12,000, or at least four times the number of unionists. The labourers and others forming the 9,000 were, in most cases, desirous of working; but they were unable to do anything without the assistance of the skilled labour of the unionists. Thus they were reduced to enforced idleness, and to the greatest distress, by the action of men over whom they could exercise next to no control; but as they were unable to fill up the places of the unionists, they had no chance of obtaining work. There is no branch of industry where a strike of a comparatively small number could produce more disastrous consequences than is the case with the iron trade.

There are no special instances where ironworkers have resisted the introduction of machinery, except in the case of some mechanical puddling machines, which the puddlers declined to work. They have also in many cases offered the strongest resistance to the introduction of improved puddling and heating furnaces, and thus valuable economical inventions have been rendered practically inoperative in the iron trade.

The Internal Working of the Union.

The union authorities are accustomed to speak of their proceedings as if they represented the whole body of ironworkers, and as if the various movements were conducted with general unanimity. The only way the masters have of judging of the correctness of these assertions is by an examination of such union publications as have from time to time fallen into their hands. The union officers, both at Brierley Hill and Gateshead, issue occasional journals, giving privileged reports of proceedings at union meetings, and in connexion with various strikes. If a complete series of these were laid before the Commissioners by the men, the Commissioners would be in possession of much valuable *bonâ fide* evidence as to the object and policy of this union organization. The tone adopted is generally such as is calculated to create ill feeling and bitterness between masters and their men. In a pamphlet issued by Mr. Kane, president of the Gateshead executive, in February 1865, we find such expressions as the following:—"The seven Pharisees in the Leeds district;" "Leeds and Low Moor tyrants;" "they (the masters) enter into combination, or "rather a conspiracy, against the life and liberty of iron-"workers." The Leeds workmen were "craven-hearted cowards and sycophants." In the journal for December 1865, speaking of one manager, "they saw the tyrant was bent upon encroaching on their rights." And much more might be adduced in a similar spirit.

The president publishes an occasional journal of his proceedings when itinerating amongst the various branch lodges. We allude to one of these, as affording evidence of the actual feelings of the men with respect to unionism:—

Held a meeting in Sheffield. Found the men had been sadly divided amongst themselves. The men grumbled because they had not been paid their lock-out money. In 1863 the union was very strong round Sheffield, but since then it had become much smaller. At Swinton he found great dissatisfaction. At Hoyland disorganisation existed. At Wakefield he held a meeting, but says it was the worst he ever attended. The next day he tried another meeting, which was a "wretched affair," and had to be adjourned. Many had fallen back from the union owing to the North Stafford and Leeds dispute, and to the levies for lock-out and strikes in England and Scotland. At Ruabon, he found the landlord of an inn, and his sister, the life and soul of the union. The men at this place were on strike; and a meeting was held, at which a dissenting minister presided. His first act at Blaenavon was to arrange for counter advertisements to those inserted by the masters at Ruabon. In South Wales he lectured on union subjects; and found the men very much irritated at the manner in which they had been treated by the Brierley Hill executive, the result being that confidence was nearly destroyed, and the union almost a dead letter. With the exception of Blaenavon and Blaina, there was very little union in Wales; and against its becoming better the difficulties appeared almost insurmountable. He next held meetings at Llanelly and Blaina. He addressed meetings at Llandaff and Rhomney, but the lodge at the latter place had but a short existence. The men seemed indifferent to unionism; and one man said the union was no good, or why did they not prevent the prices being reduced. At Brymaur there was only a small meeting; but at Llanelly things looked better.

The tone of the journal indicates that the president found, in most of the places visited, no hearty feeling in favour of unionism; and it seems that the strongest language and efforts were required to make the men become permanent paying members of the union.

From the list of secretaries' addresses appended to the journal above mentioned, it appears that a considerable number of the union secretaries keep public houses; 11, at all events, are returned as publicans.

The next report gives the proceedings at a delegate meeting, held at Consett, January 1866. Each delegate was called upon to give an account of the state of union affairs in his particular district. One delegate complained of the conduct of the works' secretaries in failing to make returns. The general state of the north-eastern district was good; but Fence Houses was very bad. The delegate for the north-western district gave particulars of a strike which had occurred at Witton Park, and two weeks' allowance was voted to the men. Other Witton men were dissatisfied with their prices, and the council ordered their cases to be taken up. A matter of dispute was also reported from Middlesborough; and some extremely offensive letters and resolutions are printed in this part of the journal; also correspondence with a Stockton firm, in which the objects of the masters' association are very improperly quoted. The delegate from Scotland, referring to the Middlesborough case, said it was incumbent on the association to bring up the lowest rates to a fair average country price; for the object of the association was to raise the lowest to a position with the highest—not to allow the highest to be brought down. With reference to a grievance of the Consett men, it was resolved that the union should support the men in their demand; but their movements must be guided by the number of men the union had on strike. The men at East Jarrow, who had been sent to prison for neglect of work, were allowed 2*l.* per man as compensation. The Ruabon delegate said the men in that district had been on strike for twenty-four weeks. (The men afterwards went to work without securing the advance for which they struck work.) The case of a man who absented himself from work without notice was not entertained. The London delegate said, that since the Leeds lock-out the London union men had fallen off very much. Several grievances were brought forward by the South Wales delegate, and ultimately a missionary was engaged to spend the whole of his time in propagating unionism in Wales. The reports from the Scotch lodges were in many cases very unsatisfactory. With respect to a patent puddling furnace which had been introduced, it was resolved that the men should demand six heats' pay for five heats' work. The sum of 75*l.* was voted to the committee having charge of the movement, relative to modification of the existing law of master and servant.

The proceedings alluded to clearly demonstrate—

1. That the operation of the union is to take the settlement of disputes out of the hands of the individual workmen affected, and to place such matters under the management of the central authority.

2. That the ironworkers are not unanimously in favour of unionism; nor do they generally admit that the organisation has worked satisfactorily or beneficially for them. There is a pervading tone of complaint about the apathy of the workmen and the appointment of special missionaries to stir up a spirit of unionism in certain districts, and the itinerant work of the president show that the union is only supported in large measure under compulsion.

3. That the levies for the support of the Leeds men, while refusing to work on non-union principles, and for the support of the North Staffordshire men on strike, had not been approved of by a large section of the men, and that these had subsequently left the union.

Ironmasters' Associations.

There are several ironmasters' associations; the oldest is the one in the South Staffordshire district. This association has held quarterly meetings for many years. At these the selling prices of iron for the district have been fixed, and wages were invariably regulated by these prices until recently, when some derangement of the system occurred. The principle is still adopted, however, and wages advance or recede 1*s.* per ton for puddling, and 10 per cent. for other wages, for every change of 1*l.* per ton in the price of iron, according as the "list" prices

Mr. J. Jones.

22 Nov. 1867.

of iron rise or fall. Thus, if iron goes up the men get an advance without any trouble or representation on their part. These list prices are not binding upon members of the association, and it not unfrequently happens that makers are selling at more than 1*l.* per ton under the list rates, though wages are regulated by the standard prices. The Staffordshire association also take general action in connexion with railway, canal, or other Parliamentary bills affecting the interest of the trade. The North Staffordshire association was modelled on the plan of the South Staffordshire society, but has been to some extent modified since that time. The North of England association first assumed a definite shape in 1863. It was established for the purpose of regulating prices and terms of selling iron. There were no rules or code of regulations. In 1865, after the masters of the northern district agreed to withdraw from the general compact on the undertaking of the men to sever their connexion with other districts, a set of rules was adopted, and the constitution of the association was defined. The men were to adopt such modifications in their rules as would make them conform to the spirit of the resolutions they had passed with reference to the separation from other districts. The objects of the manufacturers' association are the following:—

"The interchange of information on all matters connected with the iron trade, more especially in regard to rate of wages and current selling prices.

"The securing of united action and mutual support on these and all other important points.

"The holding free and friendly communication with the representatives of the ironworkers' with the view to the avoidance of strikes, and at the same time the prompt and united resistance of any attempt on the part of the men to enforce unreasonable demands, or to limit the free action of any individual ironworker.

"The promotion of the interests of the trade in connexion with Parliamentary inquiries, foreign tariffs, or any other matter.

"The promotion by legal assistance, when necessary, of the interests of the members of the association as a body."

The objects of the Cleveland Ironmasters' Association are thus defined:—

"The interchange of information on all subjects affecting the interests of the trade; securing united action and mutual support for the general welfare; attending to Parliamentary bills, and proposed alterations in the laws relating to employers and employed; and other similar matters."

It is entirely optional on the part of iron manufacturers and ironmasters whether they join the respective associations or not; nor do the firms holding aloof from the associations experience any unpleasantness; nor is any pressure put upon them in consequence of their isolation.

Appendix A.

MESSRS. GILKES, WILSON, PEASE, & CO., ON FURNACE MEN'S STRIKES.

Instances of the operation of the blast furnace men's union on the Middlesborough-on-Tees district, exemplifying the obtaining an undue rise in wages through the influence of the union, and intimidation of workmen at the blast furnace works of Gilkes, Wilson, Pease. & Co., Tees Ironworks, the firm having seven blast furnaces, five of which were at work, and producing an aggregate of 1,150 tons of pig iron per week; the firm having been established for 13 years, and being the second oldest of the smelting undertakings in the Cleveland district; the members of the firm personally superintending the operations of the works.

In March 1866 the furnace men, after some time agitating for an advance of wages, individually gave notice to leave in accordance with the rules of the works, unless the advance in the meantime was conceded. During this interval conferences with the men were held, and individually they expressed themselves satisfied with the arrangements proposed, with the exception of two departments of labour; the chargers and slaggers, who also agreed in every particular, except to have three groupings of qualities, which they said they would not sanction, stating this was in the hands of their union, and they could not act separately, this being a point of minor importance to the men, and upon which the different works of the district had various arrangements and practices. It was thought that the men would not hold out on this point, especially as their fellows had agreed to the proposed plan, and as no strike had taken place before this period among the blast furnace men in Cleveland, it was fully expected the men (many being old hands), would not act up to their notice, but would re-engage on the new terms.

The day the notice expired, however, it was found they all intended to cease working, and when it was represented to them that, as the majority were perfectly satisfied with the new terms, they should remain; and it would be an easy matter to obtain fresh charges and slaggers. They replied, that as the men of two departments were not satisfied, they must all go out until the concessions required were made. The blast was thus stopped, and the furnaces left standing charged with raw material; and so they remained for three days, when it became absolutely necessary for the men to be induced to return to work, or the loss of the furnaces themselves must have been incurred, for if left to cool down in this condition they could not be made again available in less than six months time, and at a minimum cost of 5,000*l.* per furnace. In vain were the men individually applied to. Usually they said they would gladly return to work, but that they dare not for their lives on account of the union, and new men could not be obtained for the same cause. As a last resource, they were invited to a conference at the works office, when about 15 appeared, whom it was supposed represented the rest; and it was not until negotiations had proceeded to an advanced stage that it was discovered that the deputation were not composed of men entirely employed at the Tees Ironworks, but consisted of men from two or three other works as well, and, in fact, formed a union deputation. The possibility of such a circumstance taking place is explained by the fact that the faces of several of the men were quite familiar. When this discovery was made it was not thought desirable to close the interview, during which the following concessions were made in order to save the furnaces from ruin. In one department, consisting of eleven distinct classes of labour, the advance in wages agreed to amounted from 10¾ as the lowest, to 60 per cent. as the highest increase; the intervening rates of rise being 12, 15¼, 23 and 30 per cent., and so on. In another department of 12 classes the advance varied from 9 to 26¾ per cent., and besides this the men obtained the grouping-of-qualities concession, and an arrangement, which was a serious giving up on the part of the employers in the way of tools and implements. These points having been conceded, the men said they were satisfied, and promised to start work again in a few hours. Presently, however, they returned to the office, and stated they had forgotten one point, and that was that the employers should compel the hoist brakesman to join the men's union, or that they should discharge them. It was represented to them that this was an act of tyranny that could not be countenanced, and rather than carry out this demand the works must be closed altogether. They persisted, however, in saying "that they would not work with him; that so long as he was not a union man he was not fit company for them;" and the matter had to be compromised by the man being removed from his post, and an inferior position given him, though the rate of remuneration remained the same. The result was that this individual joined the union a few days subsequently.

The rate of wages current before the rise in April, 1866, was equal to an average of 27 per cent. higher than the wages paid in 1860.

As stated, the Tees Ironworks are conducted by the principals, to whom the men have access any day they incline, and who are always ready to listen to any grievance or suggestion they may make. There are cottages upon the ground where a limited number of the men have house-room, water, and coals, at less rates than are current in the district. There is a sick club also attached to the works, where, for a subscription of 4*d.* per week, benefit is received to the extent of 8*s.* per week, with proper medical attendance, and 4*l.* in case of death. The funds are kept up by the fines levied on account of infraction of the rules of the works. The institution is conducted by a committee of the workmen; the president and treasurer, consisting, since the commencement, of two of the employers.

The pig iron trade took a turn for the worse, until in July 1866, a reduction of wages was asked for, amounting to 10 per cent., to enable the employers the better to meet the falling market. The men, however, emboldened by their previous success, refused to agree to this, although they were informed that unless they would work at the reduction, one-half of the producing power of the ironworks must be laid idle. They still refused, and three furnaces were in consequence blown out entirely; the men displaying the animus of the union to the last, by endeavouring to leave the furnaces with the iron untapped, the moment their term expired. The strike lasted a month, when the men required to work the two furnaces which had been damped down, resumed their work

on much the same terms as those they refused when the strike occurred in the previous April, and since then have worked contentedly; many of them declaring the union leaders deceived them, and that they would have nothing more to do with it. The three furnaces are still (April 1867) out of blast, and must continue idle until a very marked improvement in the iron trade may take place.

Several of the better hands, who were stationed on the portion of the works out of operation, have taken subordinate positions on the work still being continued.

Appendix B.

SPECIMENS OF HANDBILLS CIRCULATED IN CONNEXION WITH UNION STRIKES.

"Thieves! Fire! Murder!—Caution to the ironworkers of England, Scotland, and Wales.—Strike of the ironmasters of the Mersey Works, Liverpool, commonly termed a lock-out, against their workmen that are united in the bonds of union.

"FELLOW WORKMEN,—The following advertisement appeared in the *Daily Post* and may fairly be denominated a mantrap:—

"'Good puddlers and ball furnace men may find employment, with full rates of wages, at the Mersey Steel and Iron Company's Works, Liverpool, fifteen puddling and ball furnace men are at work with non-union workmen, together with 800 men in other branches. Members of the Ironworkers Union need not apply.—Address by letter to the Mersey Steel and Ironworks Company, Limited, Liverpool.'

"In reference to the first part of it, or that which states 'that fifteen furnaces are at work,' is a gross falsehood; there is not three non-union men there, except the 'doggies,' who are all at work, doing what they can; and as the weather is very warm, we say let them work a little longer, as it is not often they do much, especially the 'head boss,' (Mr. Clay). With respect to the last clause, we would ask, 'why do they object to the members of the Ironworkers Union?' Why, because the directors want to reduce the wages and impose more work upon the men, but the union men will not submit to it, consequently they are trying to get non-union men in order that they may be able to reduce wages when they think proper, and make them do just what the indiscreet 'doggies,' require them. It would probably be policy to just relate the reason why they are compelled to have the above advertisement inserted in the daily papers, and what has caused the present struggle between the directors and their workmen. It appears that there were two shinglers (noe-union men) that consented to get away the cinder from the hammer, and likewise to pay the hammer driver. The manager wanted to compel the other shinglers to do the same, but they being good union men refused to submit to such an unreasonable and unjust demand, consequently the directors struck against all union men, and closed their work, and are now advertising for non-union men.

"If any ironworker feels anxious to work for log wages and have plenty of work, go and be black-legs. If you want to become a disgrace or a stinkard among your fellow-workmen, and fix an everlasting stigma upon your children, go and be black-legs. Before doing so, however, we would ask you to look back to the year 1862, and see what the price paid for puddling was at that time, and you will find that it was 7*s*. 6*d*. per ton, and you had to break the bull dog (calcined cinder), to fettle the furnaces with, as well. What has got you the present price, and what maintains it? Is it the black-legs? Let each answer for himself? Union and good wages. Black-legs and tyranny. Treat all advertising quacks as impostors, and oblige your well-wishers in the bonds of union,

"THE WORKMEN."

Appendix C.

RESULT OF UNION EMIGRATION SCHEME.

The following, headed "Appeal to puddlers, shinglers, and millmen," appeared in the *Beehive* newspaper March 24, 1866, and refers to the condition of certain emigrants who had been sent out under the auspices of the union:—

To the Editor of the Beehive.

SIR,—I shall feel obliged if you will insert these few remarks in your next edition. They will no doubt prove of great value to many ironworkers, who, we know, are fixing their minds on emigration to America. Moreover, we hope that it may have another desired effect, viz., of arousing their practical sympathy in behalf of the wives and children of those men gone from our branch during our strike against a reduction of prices, which has lasted now for twenty weeks. Some twenty weeks ago the foreman of our works offered to us a list of prices, which would have been a disgrace upon us, or any body of men to accept, below the prices of the trade generally. Our refusal to accept those prices was approved of by our association at large, and so we have endeavoured up to the present, to maintain the right. During our struggle the general council have considered the question of emigration, which was approved as one likely to benefit the working classes of this country, by thinning the labour market, thereby keeping up the value of labour. Our men, in preference to submitting to anything against the interest of their fellow-workmen and the principles of the association, choose rather to leave their native soil and try the value of their labour in America. Fourteen of them went at some 5*l*. per head from the association, leaving their families entirely dependent upon the subscriptions we could get from the public and our fellow-workmen, till they could help themselves. The reports of America were of the most favourable description; thus were they confident that they would soon be able to send for their wives and families, again establish their homes, and enjoy its comforts, with something like a magnificent remuneration for their labour. What is the news? The following letters will show:—

Mr. J. Jones.

22 Nov. 1867.

"Pittsburg, Feb. 27th, 1866.

"Dear wife,—I take the present opportunity of writing to you, hoping to find you all well, as it leaves me well in health—thank God for it. I hope you won't put yourself about about me, for I am safe; but the men are all on strike, and they are all a —— sight worse off than ever. We got a good passage, and I thought you would have had to come in the spring. But if I don't get above 1*l*. a day I shall come back to the old country, for if we get money it takes it all to live, for it costs 50 cents. for a breakfast and 30 cents. for a bed. So as soon as I get the money I shall come back to you for it is no go here at all. Take this to Sam and Will, and tell them not to be gulled from home for nobody. It's a pity for people not to tell the truth about the place, and stop other people from coming from their home. But cheer up, I am young enough yet. You had better get in a little house if you can. You will hear from me again soon.

Tell the children I have not forgot them; I have them in my heart. From your loving husband,

BENJAMIN RAYBOLD.

Pittsburg, Alleghany County, Pa., U.S.
Care of Joseph Spencer, Bull Head."

"Pittsburg, February 27th, 1866.

"Dear wife, child, and friends,—I hasten to inform you I arrived safe in America, and enjoy good health, as I hope this may find you and all inquiring friends in good old England. Dear friends, we have been sadly gulled by coming to America. Tell all my friends to content themselves in England, and not ruin themselves and families by coming to America. The works are all stopped for the last six weeks, with no signs of commencing, as the men refuse to work at the reduction of wages. Dear wife, 10*s*. in England is as good as nine dollars here; besides there is a surplus of men, and they seldom work more than half time.

"Dear wife, tell my father how I have been deceived in coming to America. But yet I am of good spirits, as I enjoy good health. Give my respects to your father and mother; tell them I am well, but without money, and no prospects of earning any for some time; and when I am lucky enough to have any money I will take care to bring it to England myself, instead of sending it.

"Dear friends, you shall see us at home, as soon as we get the means to bring us. And we hope our experience will deter others from coming to try their luck in America. Dear wife, show this letter to all the friends who may contemplate coming out here, as God knows we are tired of our experience. Dear wife, be of good cheer, as I am. Your devoted husband,

"WILLIAM HUDSON."

"Pittsburg, Feb. 27th, 1866.

"Dear wife,—I write to you hoping to find you and the family all well, as it leaves me at present—thank God for it. It is with a trembling hand and an aching heart that I write to you. I am happy to say I arrived safe at New

Mr. J. Jones.
22 Nov. 1867.

York, and had a good voyage. But I am sorry to say that we are deceived, for the men were all on strike when we got to Pittsburg, about 431 miles from New York. Go to T. Jones, and tell him not to be deceived as I have been. Tell him to be contented in England, for to meet with a downfall like mine will upset his wife and family. Tell him to tell all his butty workmen not to throw away their lives for 5*l.*, as I have done. G. Yates is with me. We mean to do our best.

"Tell Hannah to take care of the children, and he will pay her back as soon as he can. Cheer up; I will do my best. God bless you and the children. All things work together for good. We have no money, but we have good hearts, and we hope you have. If we start to walk to New York we must die or the road, it is so cold. Cheer up, for I shall to the last. Your affectionate husband,

"JOHN CHERRINGTON."

" Pittsburg, Feb. 27th, 1866.

" Dear wife, and family, and friends,—I write these few lines to you, hoping to find you all well, as it leaves me at present, very well. We have been greatly deceived by coming to America, for they have been on strike in this country for six weeks, and when they are at work there are two men for every situation. The working men of Old England are gulled by emigration. For 10*s.* per ton in England is better than 9 dollars here. Dear wife, make this as public as you can, and let the men of Old England know we have been gulled by coming out here. Take letter to Bradley, and let him make it public amongst the men. My kind love to you.—Your affectionate husband,

" THOMAS STANTON."

The above letters are copies of the originals that have come to hand this week. They slightly show the destitute condition of the men. Now, sir, allow me to tell you and our fellow-workmen of the hardships of the families. Eleven out of the 14 have left families behind; some have left six children, some four, and three, and two. The least family is one child and wife. In most of these cases nearly all their goods were sold previous to the men going to America. Others have sold what they could spare to maintain them since, and we have been able to get them sometimes 2*s.* 6*d.*, 3*s.*, 6*d.*, and 4*s.*, by subscriptions from our fellow-workmen and the public.

But their sympathy has died, or the officials at the different branches are thoughtless about these poor families who stand in circumstances close akin to widows, and fatherless children. To these officials we must again appeal, and to our fellow-workmen and brothers in unity. We are not now pleading for us who are still out and left behind, but for the families above-mentioned. We hope, therefore, again to see your sympathy practically displayed in behalf of these poor families. Poor they are, sir, in reality; I speak that I know and testify that I have seen.

One of these poor women had a child died last week. I was sent for try to get the burial fees reduced in this one case, seeing the destitution of the family, but I am sorry to say without success. No money in the pocket, no food on the shelf, a sorrowful heart, and eyes swollen with grief have I seen, all the result of a man's determination to maintain the prices of his trade and the principles of his association against the unreasonable requirements of unprincipled employers. Yet we who are left are still determined not to fly from our duty, but say, none of these things move us.

In conclusion, I ask, "Remember the widows and fatherless in their affliction."

Subscriptions will be thankfully received by the secretary per post.—Remaining, sir, yours truly,

JOHN BRADLEY, Secretary.

Park Lane, Sandbach, Cheshire,
Associated Ironworkers—Wheelock Branch.

Appendix D.

COPY OF LETTER TO NORTH OF ENGLAND EMPLOYER.

SIR,—This is to inform you that your workmen have had a meeting to discuss the merits and character of the man you chosen to be foreman; and, after due deliberation, they have come to a conclusion that a greater tyrant there is not in the kingdom, and his character is well known both in England and Scotland; and, therefore, your workmen will give notice to close the works, for they are fully determined not to work under him. At the same time think not this is on account of a selfish principle, for it is as much for your benefit as that of the workmen, for you must be aware a man that will act a tyrant over workmen will not stand to be one over you if there is the slightest chance whatever. Sir, the association will be much obliged if you will place your decision in the office window before Thursday, when, if you think proper you can be attended to.

Signed on behalf of the
NATIONAL ASSOCIATION OF PUDDLERS, &c.

April 30th, 1864.

The witness withdrew.

Adjourned to Wednesday next at 11 o'clock.

1, Park Prospect, Westminster, Wednesday, 27th November 1867.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.
The Right Hon. the EARL of LICHFIELD.
LORD ELCHO, M.P.
Sir DANIEL GOOCH, Bart., M.P.
HERMAN MERIVALE, Esq., C.B.
JAMES BOOTH, Esq., C.B.
THOMAS HUGHES, Esq., M.P.
FREDERIC HARRISON, Esq.
WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. J. Jones.
27 Nov. 1867.

Mr. JOHN JONES further examined.

9540. (*Earl of Lichfield.*) There were one or two questions which I asked you the other day to which you were then unable to give me an answer, but perhaps you can give us information on those subjects now. One point was, that you referred to instances in which men had been assaulted in cases of strike which occurred, I think, in the North. Can you refer the Commission to any cases where assaults were brought before the magistrates?—I have referred to the case alluded to in my statement. It had reference to some of the men connected with Messrs. Fox, Head, & Company's works. I saw one of the magistrates who was on the bench at the time, and he stated that one man was committed for intimidation, and was, I believe, sent to prison, but a gentleman will be in attendance here tomorrow who will be able to give details of that particular case.

9541. There was another point upon which you were unable to give me sufficient information. It was with reference to some part of your statement in which you make remarks about a letter that was written by the president of the Ironworkers' Association to the men in Scotland. You say "This document explained "to the Scotch ironworkers that the union authorities "had resolved to call out the North Staffordshire "men, and that all other districts were to support

"them." Have you been able to refer to that since?—I have referred to that communication, but I have not found among the papers in the possession of the association the letter itself. I should just explain that I have only been connected with the North of England trade for about a year, and therefore I have not been able to go into all the papers which have been accumulated in connexion with the association for some time previous to that; I have not had time to go over them since my last examination, having been back only for a very short time; but this is an extract of a letter from Mr. Kane, dated the 28th January 1865, read by Mr. Palmer at a conference between masters and men on March 15th, 1865. The conference was at Newcastle, and this was printed in the "Newcastle Chronicle." "That "a delegate meeting was held at Brierley Hill, and a "resolution was passed to the effect that the men "of North Staffordshire resist the reduction. The "council of Brierley Hill called their number of the "North Staffordshire men out on strike, and acting "in concert with our friends at Brierley Hill, and "seeing the necessity of such, we immediately in-"structed the men of the Hanley district to come out "also to the number of 450."

9542. Is that a letter that you put in?—This is in fact the extract referred to. This was addressed to the Scotch lodges.

9543. In what shape do you put it in?—As an extract from the letter referred to in my evidence.

9544. Where did you get it?—This is from a published statement in the "Newcastle Chronicle." I was not present, of course, at that meeting, but this letter, as I understand, was brought forward at the meeting held at Newcastle on the 15th of March 1865, and Mr. Kane and I believe other representatives of the men were present. I do not myself know whether anybody beyond Mr. Kane was present then, but certainly Mr. Kane was. It seems that Mr. Palmer was in the chair, and called attention to this letter which had been published in some of the Scotch papers, or in one of the Scotch papers, and this is the particular extract which states that the men in North Staffordshire had been called out by the advice of the union. In connexion with the paragraph in my statement referring to the fact that physical intimidation had been resorted to, I did not particularly mention it in my statement, but I had some personal experience of not a very pleasant character, and perhaps that may be taken as bearing out the statement there.

9545. What do you allude to?—I will not put it that it was owing to the union authorities, but I may say that during the north country strike I believe there were 11 or 12 sets of verses published, most of them aimed at me as secretary of the Masters' Association, and in one of these which came under my notice, the writer particularly recommended the men to serve me in the same manner as a man named Bushell had been served. A year or two before there had been some dispute in connexion with the works where he was timekeeper, and he had made himself obnoxious to the men. I do not know the reasons, but the men went out on strike against this man, and the result was that he was mobbed out of the works, his windows were smashed, and he was obliged to leave the place. The case of Bushell had been alluded to in several of the journals of the men, and at one of their conferences it was recommended that one of the principal managers in the North of England should be served in the same manner as this man, Bushell had been. These verses to which I have referred recommended that I should be treated in the same manner. Nothing came of that for some little time, but about the beginning of November, I think, or the latter end of October, when I was passing through the town, and happened to go into one of the shops there, I found that a number of people were collected round the door when I came out, and these gradually got up to, I do not know how many, two or three hundred perhaps, and set upon me yelling and shouting and hooting a good deal, and at last they began to pitch mud and stones. That went on till I reached my office, and I was obliged to be guarded afterwards for some time, because the superintendent of police sent to inform me that he had information that they were on the look out for me, and that as I returned they were going to set on me again. I think that that is a case of intimidation.

9546. Do you regard that conduct towards yourself as being in consequence of anything that you did as secretary to the Masters' Association?—I attributed it solely to my connexion with the Masters' Association. I cannot see that there was any other reason for it.

9547. What strike was that, was it the strike of 1866?—The last strike, the strike of 1866.

9548. The North country strike?—Yes.

9549. (*Mr. Harrison.*) Were those men labourers or puddlers?—I think that they were a mixture of all the people that were out. A great number of people were about, I cannot say who they were.

9550. (*Mr. Booth.*) Were they members of the union—could you recognize them as being members of the union?—I cannot say, I knew scarcely any of the men, and do know scarcely any of the men connected with the different works. These were men that were collected, as the men that were out of work were in the habit of collecting, in the market place. I passed through the market place on my way to my office and these were a number of men collected there. There were, of course, a considerable number of roughs and others that were drawn in, but I certainly may safely state that a very considerable number of ironworkers were there; whether they were mostly union men I cannot say.

9551. (*Earl of Lichfield.*) I should like to know your opinion of the working of the system under which the price of wages has been ruled by the price of iron in South Staffordshire. I believe it is only in South Staffordshire that that system has prevailed, is it not?—It does not apply in the North, because we have no such machinery for fixing prices in the orth.

9552. (*Mr. Mathews.*) But it is the case, is it not, that if the price of iron falls in the north, it affects wages there as much as in South Staffordshire?—Yes; if the price of iron were to go down wages would go down, but there is no arrangement by which the masters meet at certain intervals and quote prices as in South Staffordshire.

9553. (*Earl of Lichfield.*) Is it the case in the north that a fall in wages follows as a matter of course upon a fall in the price of iron?—No, not at all. There is a difficulty there, because there are no recognized means of stating what the price of iron really is. In Staffordshire the masters meet together and quote the prices of iron, bar iron and so on, but in the North of England there are no such meetings where quotations of prices are made, and consequently it can only be determined there by the general state of the trade. If the state of trade is bad, then, naturally, the price of iron goes down, and that fact can only be obtained from the quotations which appear in the public papers.

9554. (*Mr. Mathews.*) In the event of the South Staffordshire masters meeting and declaring a reduction in the price of iron and of wages, the Middlesbro' ironmasters would have to do the same?—I do not think it necessarily follows.

9555. They could not keep up the price in Middlesbro' if the South Staffordshire ironmasters reduced it, could they?—Not for any length of time—but I think that the price of iron went down in the North of England before it went down in Staffordshire, because those departments of the iron trade which more particularly centre in the North of England were affected sooner, and the price of iron went down rapidly in the North of England. That was one point which the men could not understand. They conceived (and naturally enough) that we in the North of England were guided by the quotations in Staffordshire; but the price of iron in the North was really very

Mr. J. Jones.

27 Nov. 1867.

much below the quoted price in Staffordshire, a long time before it was found necessary in Staffordshire to reduce the price officially.

9556. (*Mr. Harrison.*) You put it in the first paragraph in your paper, just at the bottom of the first column in this way, "Wages in this branch have "for many years been regulated in most districts by "a rough sliding scale based upon the selling price of "iron"?—Yes; I do not state there that it is by the quotations of the ironmasters in any one district, but if the price of iron were to go down in the North of England, of course wages would soon be down also.

9557. But it is understood that they follow, is it not; that they go up and down along with the price?—In South Staffordshire that is so. No doubt if the price of iron were to go up in the North of England district there would very soon be an agitation for an advance of wages, but there is no definite and fixed plan, such as there is in Staffordshire, for settling that point. The ironmasters would meet at their quarterly meetings in Staffordshire and fix the price of iron; if they raised the price of iron a pound, wages would go up, and no doubt that would have considerable influence in other districts, and if the circumstances of those districts were anything like the circumstances in Staffordshire, wages would soon go up as a matter of course. The men would make representations, and the masters would doubtless allow the advance as they did in 1863.

9558. (*Earl of Lichfield.*) Can you mention any case of a rise in the price of iron taking place in South Staffordshire without a corresponding rise taking place in the price of wages?—I am not quite aware of the exact details of that 1863 strike, but my impression is that such a case has not occurred. That is my impression, I say, but I do not know the Staffordshire trade so far back as to speak to that.

9559. You are referring to the 1863 strike now?—Yes; I do not know all the details of that strike.

9560. You refer to that strike in your printed statement and say, "The result was that the iron-"masters advanced the price of iron, and gave the "wages which had been demanded three months "before"?—Yes.

9561. Then they had not advanced the price when the men asked for an advance of wages according to that?—No, they had not advanced the price.

9562. (*Mr. Harrison.*) They had advanced the price previously; the price of iron had been advanced some months before the strike, without a corresponding increase of wages, and then the strike came in order to raise the wages up to that point; was not that it?—I think not.

9563. Are you clear that those were not the facts?—I believe that those were not the facts. I believe the facts were that an agitation came on the part of the men for an advance of wages, and that the trade was not at that time thought to be in a position to give that advance. Men were put out on strike in a number of works, and a portion of the district was stopped in that way. That went on for a certain length of time, say about three months or 14 weeks perhaps; then, the demand for iron having increased very considerably during that time, the masters gave the wages asked. They advanced iron 10*s.* per ton and increased the wages at the rate of 1*s.* per ton in puddling and 10 per cent. on other wages. Then a very short time after that, as the trade continued to improve, the masters advanced the price of iron 1*l.* a ton, and gave the men an advance of 1*s.* per ton again; so that the price of iron was advanced 30*s.* and the advance in wages was 20 per cent. I believe that is how one of the sixpences now received above the ordinary average price was obtained.

9564. (*Earl of Lichfield.*) Had that rule been adhered to in the north, or can you tell us any case in the north in which there has been a rise in the price of iron without a rise in the price of wages?—No, I cannot give any case of that kind, because there is no definite method of stating it. The price of iron goes gradually up according to the number of contracts and so on. If there had been a definite machinery for these quotations, of course it would have been quite easy to refer to them; but as there is no such arrangement in the North, I cannot refer to any definite advance of iron. If, however, the price of iron went up in Staffordshire, it is quite certain that that would indicate a general advance in the price of iron, and no doubt the price of iron would go up in the North of England about the same time; and as a matter of fact I believe that the wages movements in the North of England were pretty nearly simultaneous with those in Staffordshire. In 1863 they were advanced three times, amounting to about 30 per cent. in the North of England, and I believe that that was very much the same as in Staffordshire.

9565. It comes to this, that in South Staffordshire there is a published list of prices which governs the rate of wages, but that that is not the case in the North?—Quite so; that is to say, not a list of the Ironmasters' Association; there are plenty of lists, but they are not official in the same way as in Staffordshire. The ironmasters in Staffordshire meet once a quarter and pass a resolution stating what the price of iron shall be for the ensuing quarter, that is to say, the price of bars and so on, by which other varieties are regulated, but in the North of England there are no such quotations as those; you can only get them from the various exchanges, from the public lists, from brokers' circulars, and so on.

9566. Then I understand you to say that there has never been a rise in the price of iron in South Staffordshire out of which the men have not obtained some advantage?—I am not aware of any such case.

9567. How do you consider that that system has worked in South Staffordshire?—I have always heard that it has worked very well. Certainly it works in this way, that the men must at once get the advantage of any advance in the price of iron, and it works particularly to their advantage then, because most masters when prices are low have a number of low priced contracts, contracts at very low rates, which perhaps have to run on for a very considerable period after the nominal advance in the price of iron has taken place; but after this nominal advance in the price of iron has taken place, wages have to be increased, and those wages would apply quite as much to the low priced contracts as to the higher priced contracts. Therefore, in that case the men get an immediate advantage, and under any circumstances they get a per-centage of the rise in the price of iron.

9568. (*Sir D. Gooch.*) Contracts would still be running at high prices for a master when a reduction took place probably, so that the masters would get the advantage sometimes?—But when contracts are high people are very cautious in entering into these very long contracts, and their contracts would not be so far a-head as they would be when the prices were low. At the present time I daresay many makers of pig iron have applications for contracts running over two or three years if they were ready to enter into them, but no one would enter into those contracts when the prices prevailing were at the highest point; at such times they only just buy a short time a-head.

9569. (*Earl of Lichfield.*) When there has been any dissatisfaction expressed by the men with regard to the state of things at the time, has it taken the form of complaint against the conduct of the masters in either raising or lowering the price of iron?—Are you referring to South Staffordshire or other districts?

9570. I am referring to districts where this system prevails of a sliding scale with a published list of prices?—I think that in South Staffordshire in 1863 the objection was that the works were getting fully occupied, and the men thought that as labour was in considerable demand it ought to be paid a higher price. I do not know that they objected to the published list, but they made an agitation certainly for an increase of wages. No doubt it was their impression that the masters were really getting more money than the published list represented, but I am not aware that they made that the groundwork of the objection.

9571. In the case of the strike of 1863, which you have referred to in your paper, the complaint on the part of the men was that they were not getting sufficient wages. But I presume they were getting the rate of wages fixed according to the published list. I take it for granted that that was the case?—I do not know how they expressed their feeling that they were not getting sufficient wages. I think their view was that the trade was getting brisker, and that there was a greater demand for men. I ought to explan here that there had been a considerable depression in the trade for some years previously, and many men had been naturally driven out of the trade. I believe that a large number of men who were engaged as puddlers up to 1857 when that depression came went into other works, and therefore the labour market in the iron trade had been considerably thinned by that depression which had been going on. Consequently when there was a little improvement in the trade there was an increase in the demand for men, and that being so, the men naturally felt that as labour was in very active request they might begin to ask for higher wages, but I am not aware that they made it any special point that the masters were getting more for their iron than was proportioned to the wages. Probably that was their idea, but I am not aware that they made a special statement of that kind.

9572. What is your opinion of the system under which the work is done by contract, the system, that is to say, under which a puddler is paid a certain rate per ton, and then pays all the men under him?—In the case of a puddler and in that department I cannot conceive any other system working, but with respect to the mill work, that is to say, when the iron has been puddled and has been brought out in that department, and has to be converted into merchant iron, into rails and bars and so on, my impression is that there the contract system has been pushed rather too far. It is the general impression on the part of the trade I know that it has worked advantageously. It has been in existence for a very long time, and consequently there is very great disinclination to interfere with existing arrangements; but I believe that a slight modification of it would be an advantage, so far at all events as to allow all of the men to be paid, or their prices to be fixed at the office instead of its being left to the contractors to make what terms they like with the men; I think that it would be an improvement if that contract system were modified so as to have all the prices fixed by the ironmasters. It works so far disadvantageously that the men have shown that in several cases where there has been a reduction they have not been able to get that reduction off the men whom they employ, but if the prices were fixed from the office, then, whether there was a reduction or an advance, all these prices would be regulated to some extent, and still the head man, the man in charge, would have a proportionate amount for the supervision which he exercises.

9573. (*Mr. Mathews.*) Would it be possible to carry that system out where the head man has the entire control of these men?—No doubt there are considerable difficulties in it.

9574. Is it not found to work most advantageously for all parties that the man who has the entire control of the men should pay them?—I believe that that is the general impression of the trade, and that is the reason why they object to make any alterations in their contract system. The disadvantage of it is that a few leading men can throw out an immense number of people, and keep them out. In the case of a long strike the number of men with whom the matter rests is often very small, a number of men are thrown out, and the masters cannot deal with them at all, because they are employed by these contractors.

9575. You mean that a puddlers' strike necessarily brings all other departments to a standstill?—Yes; and even if a mill roller strikes all the men under him are unable to go on.

9576. The puddler employing one man and the mill man several, that is the difference?—Yes; only a roller is a contractor of a larger calibre.

9577. He is a more skilled workman than the puddler?—Yes.

9578. (*Earl of Lichfield.*) Are there any unions existing amongst the under hands?—I am not aware of any. The puddlers allow them to join their union; the puddlers bring them in as underhands. There is a special regulation about underhands in their rules.

9579. (*Sir D. Gooch.*) With regard to the printed lists which the Staffordshire masters issue at their quarterly meetings and which you say are not believed in by the men as representing the true prices that are given, is it the case that the prices mentioned in the printed list are those which are given by the public or is it not rather the practice and the rule that that printed list gives the highest price, and that many of the masters do sell iron under the price in that printed list?—Yes it is so.

9580. The public themselves knowing the price as the standard price do not give more, but the public who are purchasers endeavour to get from the masters something below that printed list?—Yes, I should say that the large proportion of the firms are getting nothing like what are called the list prices.

9581. It is a complaint in Staffordshire that they undersell each other, is it not?—Yes; but that arises from the difference in the quality of the iron.

9582. It is a question of a man who can sell his materials, taking a little less from the customer to have an advantage over those who adhere to the printed list?—Yes, the printed list represents of course the maximum.

9583. (*Earl of Lichfield.*) You say that in some cases they are not getting the prices of the printed list, are they in those cases paying the wages as ruled by the sliding scale upon the published list?—Yes, certainly, consequently a master who is only getting 6*l.* 10*s.* per ton for his iron, which is quoted on the published list at 7*l.* 10*s.*, is at a disadvantage of 10 per cent. in his wages, he is paying 10 per cent. more for his wages than he ought to be according to the rule.

9584. (*Mr. Harrison.*) I think you said something about a general policy on the part of the unions of forcing up the rates of wages above their existing standard. To take the last 10 years, what instances can you give upon any considerable scale in which the unions have endeavoured to do that?—I may state that as far as I gather, the action of the men during 1864 and 1865, in the North of England certainly, was to take out the highest prices that were paid in any mill for any particular class of work, and to insist that the price should be raised to that in the other works. I have already explained that it is impossible, except perhaps in the case of puddling, to institute a close comparison between the prices paid at the different works. Almost every mill has its specialities, almost every firm will be differently situated in some respects from others, and the puddling furnaces are about the only things that are the same in all cases. Therefore, when a price is found perhaps in one mill that is comparatively speaking high, the probability is that there are exceptional circumstances connected with that particular mill which fully account for the extra price which is paid in that special department. Now it is unfair to take that price and to say that everybody shall be brought up to it, since these specialities do not apply to all the works. I state that I gather (and the experience of the North of England seems to prove it), that whenever there was a high price paid at one works in a district the men at their meetings took that high price and endeavoured to force up all the other members of the trade working a similar kind of iron to the same point. I see that in the report of the conference of the men held on January the 3rd 1866 it is stated that "Mr. Parkes of "Glasgow referred to the prices paid at Middles- "borough by saying that in consequence of the "Middlesborough men working for so much less than "their neighbours, it was incumbent on us, as the "directors of the association, to bring up the lowest

Mr. J. Jones.
27 Nov. 1867.

"to a fair average country price; for the object of "our association was to raise the lowest to a position "with the highest, and not to allow the highest to be "brought down." I have pointed out that these higher prices were in many cases explained by the peculiar circumstances of the respective mills. Then, I find that at the same meeting a conversation took place which I perhaps may be allowed to read.

9585. I do not wish for a moment to interrupt you, but I am not sure that you quite understood what my question was; I want to know what are the instances in which by strikes or by combined action of the unions the associated puddlers have forced up the price above what was then current?—I believe that there were three or four strikes in the North of England, which were owing to the men endeavouring to force up the prices for heating, and so on, to these exceptional wages paid in some of the mills. Those are partial strikes of the men that occurred in 1866. I believe the case of Messrs. Whitwell was one in point, and I believe also that in the case of several strikes which took place at Walker and other places, the men struck to raise the prices up to other prices that were said to be paid in some parts of the district.

9586. Did that strike at Walker originate with, or was it directly promoted by, the union?—Yes, decidedly. The men would not have struck in any case except they had the consent of the union; the matter was brought before the local unions, and I believe brought before the conference of the general association, and it was only when they had the consent of the general body that they were allowed to strike. I am not aware that any of these strikes were entered into without the approval of the general union.

9587. Where the Staffordshire meeting of ironmasters declares the price of iron, and, as you say, wages currently follow that at the rate of 1*s.* for every 1*l.* of the selling price per ton, those wages are paid currently throughout the district where that rule applies, are they not?—When the price of iron rose 1*l.* a ton, the wages in all departments would be advanced 10 per cent. or 1*s.* per ton.

9588. And that would be uniform, would it not?—No, because there is no uniformity between the prices. I am speaking of a district where there is not that uniformity in the prices. The circumstances of each works are so peculiar that there is not a uniformity. Take the rolling of railway bars; the circumstances are the same in scarcely any particular case. The number of furnaces that are employed to heat the iron modify the make to some extent. Those circumstances are different in each works, and to some extent it is necessary to have a different price for every works. I am now speaking of the action of the union in such a case as this. Supposing that there are five prices at five different mills, varying from 2*s.* 1*d.* to 2*s.* 6*d.*, the action of the union has been to bring the 2*s.* 1*d.* rate for instance up to the 2*s.* 6*d.*, notwithstanding that there might be particular circumstances connected with these five particular mills to justify a difference.

9589. In the Staffordshire district when the price of bar iron is declared to be 7*l.* the wages per ton given for puddling are 7*s.*, are they not, or is it 7*s.* 6*d.*?—I am not aware that the wages have ever been brought below 7*s.* 6*d.*

9590. That 7*s.* 6*d.* is paid for puddling a ton of iron throughout the Staffordshire district, is it not?—Yes.

9591. Now I ask you, what are the instances within the last 10 years in which the puddlers union have on any considerable scale engaged in a strike for the purpose of forcing that rate up above the proportion with respect to the selling price of bar iron?—I am not aware of any instances in South Staffordshire; my experience in those matters is in the North of England.

9592. You are aware of one instance, I presume, because there is the Staffordshire strike of 1863, which you have mentioned before?—With reference to what I now state as to cases where the men have agitated to force up the prices to the highest paid in the district, I am not now speaking of a given district price, but of a case where they have taken some exceptionally high price, and endeavoured to bring up the others to that.

9593. There is no question that the price of wages for puddling a ton of iron is equal throughout that district; that is admitted by all, is it not?—As to the price of puddling, it may be, but then that is only one out of a very great number of departments in ironworks. The rolling is a very important department, including all the rolling and heating wages after you have got the puddled iron to manufacture it into finished iron.

9594. I will take it in both ways, I will take it in the first instance of the action of the union in raising the rates throughout above their existing standard. Now I want to know within the last 10 years in which of the great strikes that has been the case?—It is not of the great strikes that I am speaking, but of the partial strikes. I say that the action of the union in the districts, certainly in the North of England, has been what I have described, quite apart from these general movements in Staffordshire or the general movements affecting the whole district in the North of England. Certainly in the North of England there have been great differences affecting the price of puddling; there has been no such uniform rate as prevailed in Staffordshire. It is well known that there were till quite recently, and that even up to the present time there are considerable differences in the rates paid at the different works; and it was only after some difficulty that we endeavoured to meet the case last year by fixing a special price for each of the varieties of iron which we should call roughly grey iron, mottled iron, white iron, and refined iron, or plate. We fixed the price for each of these, and then we stated that the price of puddling should be so much, and that the mixture should be *pro rata*, that grey iron should be paid at the rate of 9*s.*, and white iron at the white iron price. That has been maintained up to the present time, and it has got rid of some considerable difficulties, for previously we were constantly met by differences in the price of puddling. I believe that the actual price they are now paying in the North of England will be found in very few instances to be exactly the same. Therefore it would be possible to find one firm paying 7*s.* 6*d.* and another 8*s.* 6*d.* according to the mixture and the circumstances of the case. Now what I am saying is not that it was a general movement, but that it was a sectional movement on the part of the men to advance these particular prices, and I say that in the arrangements of the conference there are indications that that was to be the policy of the union, and not to extend over the whole district.

9595. There can be no question that the policy of the union, and I suppose the policy of working men generally, would be to get the highest rates known to be paid in the trade. That is perfectly intelligible, but I ask you what instances within the last ten years you can mention, on any considerable scale, in which the union has by a strike forced those rates up?—I do not know whether in the North of England they have succeeded. I think the action of the masters was to prevent their succeeding, but that was what they intended to do.

9596. You have mentioned five strikes in your paper which we have before us?—Yes, those are general strikes.

9597. Which of those strikes were directly for the object of raising the rate of wages above that current at the time of the strike?—The Staffordshire strike certainly was.

9598. That is the first of the five. Were any of the other four for that purpose?—One of the north county strikes, there referred to, in the beginning of 1866.

9599. Which was that?—That was the blast furnace men's strike as to which there is an appendix of the evidence given by Messrs. Gilkes and Company.

9600. Then the Staffordshire strike of 1863 is the only strike on a great scale, within the last ten years, in which a general demand of an advanced rate has been made by that means, with the exception of the case in 1866 which you have just mentioned as occurring at Messrs. Gilkes?—It was not simply at Messrs. Gilkes's, it was at the works of all the ironmasters in the district, but I have only brought the evidence of one firm on the subject. In the North of England we have two associations; the pig-iron makers are quite distinct from the bar-iron makers.

9601. With regard to that strike of furnace men in 1866 which was for a rise of wages, those men were labourers were they not, not puddlers or millmen, or skilled workers at all?—Well, they come nearer to the definition of labourers than the men generally employed in mills.

9602. You call them labourers in your paper?—Yes they were for the most part, but not entirely.

9603. Had they a union of their own?—Yes.

9604. But that was perfectly independent of the puddlers' union, or the millmens' union, or those which we have had before us?—Yes.

9605. Throughout the greater portion of the work in manufacturing iron, the payment to the skilled labourer is by the piece, is it not?—Yes.

9606. The puddlers are paid by the piece and the millmen are paid by the piece?—Yes.

9607. And we may take it generally that throughout the work payment is by the piece, per ton usually?—Yes, that is to say as far as the union is concerned, those men that are connected with the union are nearly all I think contract men.

9608. If that is the case it is impossible that there should be an uniformity in the earnings of each man without reference to the skill of the particular labourer, is it not?—Yes, and it is not simply a question of the skill of the labourer, but it is one of the laying out of the works as well.

9609. Therefore, we may say generally that throughout the skilled departments of the iron manufacture, there is no pretence whatever for saying that the union has interfered to produce an uniform payment of men without reference to skill or ability?—The union has moved to produce uniformity in the tonnage rate for the different classes of men.

9610. But I mean in order that each man should earn by the day without reference to his skill the same price. There is no pretence whatever that any such thing has been attempted, or would be possible. It is not possible from the nature of the work in fact?—Just so. It is a piece-work system altogether.

9611. (*Sir D. Gooch.*) You mean that there are different classes of men altogether, the labourers not being paid the same as the puddlers?—No, I am speaking of the union men. They were all contract men, and the union has not said that when they had earned a certain sum of money they were to stop production.

9612. (*Mr. Harrison.*) Twenty puddlers who worked at adjoining furnaces would at the end of the week find themselves in possession of different amounts of money according to their skill?—Yes.

9613. I am going to put to you a rather general question, but perhaps you may be able to give us some general answer. Speaking generally, how do you sum up the injuries which in your opinion the public receive from the operation of the workman's unions upon the iron manufacture. In what respects do you consider that they operate prejudicially to the public?—That is a very wide question, it is a question that really one would have to think about a little before going into it.

9614. I thought you came here for the express purpose of telling us that?—I did not consider the question of the public so much; but taking the effect upon the public, in the first place I believe that the unions have as I have stated not really advanced the amount of money which the men in those particular departments have received. I do not say that they have not forced up wages in certain cases beyond their proper level, as regulated by the trade usages.

9615. What do you mean by "trade usages?"—I am speaking of the rise of 1*s.* per ton in the price of puddling. At the present time in Staffordshire the price is 8*s.* 6*d.* per ton for puddling, whereas the selling price of iron is only 7*l.* 10*s.*, and therefore according to that the price of puddling ought to be only 7*s.* 6*d.* I say that 1*s.* has been obtained I believe (certainly 6*d.* of it has) by union movements. Now on the face of it, that appears to be a direct advantage on the part of the men.

9616. You seemed to be assuming that the rate of wages should not be governed by the supply and demand of the market, but by some trade usages, and that made me ask what you meant by "trade usages?"—I am referring simply to the custom which you have already mentioned, that there should be 1*s.* per pound on the price of iron paid for puddling, and I say that it is not so now in Staffordshire, but the price is 1*s.* above the average, 1*s.* above that price which, according to the usage of the trade which has lasted for many years, it should be.

9617. That shilling has obtained since 1863, has it not?—I believe it was begun to be got in 1860.

9618. It was finished in 1863?—Yes.

9619. Since 1863 it has gone up and down with the selling price of the iron?—Always with the shilling in favour of the men.

9620. Of course that point which you start from is entirely an arbitrary thing, and it comes to this, that the proportion was slightly varied in favour of the men in 1863?—Yes, I am speaking of the trade usage which you refer to, that usage is paying the men a shilling in the pound on the selling price of iron.

9621. (*Lord Elcho.*) When was that trade usage introduced?—A long time ago, in the time of Mr. George Thorneycroft. I daresay Mr. Williams will be able to state definitely when it was. That has governed the trade for a very long time, and in 1863 it was modified. I have said that it appears on the face of it that there has been a special advantage owing to the union operation, and that wages are at all events a shilling above what they would have been, according to the old standard. But then I maintain that the men have not derived the full advantage represented by that, because in the first place there have been a great number of strikes relative to questions of wages, and the union contributions have been very heavy in supporting these strikes—the Leeds lock-out, and so on, all coming from the wages fund; and in addition to that there is no doubt that a very considerable amount of the iron trade has been diverted into Belgium. At the present time the Birmingham merchants are actually buying nails from Belgium, and the pig iron that is used for making that bar iron has in many cases gone from the North of England. Consequently the Belgian ironworkers must have received a very considerable amount of the money which, under ordinary circumstances, would have been paid to the English ironworkers. If there is less money paid in the iron trade that again must affect all the public who are dependent upon the iron trade, and in that way it comes to be a very serious matter for the public. If you stop the wages from coming into the Middlesborough district, for instance, that affects all the tradesmen there, and that money is paid away into some other district—Belgium say, and goes to the benefit of the tradesmen there.

9622. (*Mr. Harrison.*) If, as you tell us, the union has only once in the last 10 years forced up the price of wages above the existing standard, and if it has no means of obtaining, and does not attempt to obtain, uniformity of payment for each man, how do you connect the partial diversion of the trade of Belgium with the operation of the union?—It must be remembered that the operation of the union is quite as effective whether it is to resist a reduction in wages, or whether it is to go for an advance, because if the ironmasters find that they cannot sell

Mr. J. Jones.
27 Nov. 1867.

at a certain price, and that the Belgians are coming into the market and offering iron at a lower rate than they can offer it at, they are obliged to go down to that price, and then it comes at last to this, that they have to insist on a reduction in wages. In North Staffordshire the difficulty arose from the men resisting a reduction of wages. Then in the North country strikes it was manifestly the same. In the manufacturing department, and in the pig iron department, the men resisted in one case for a month, and in the other case for 16 to 20 weeks, a reduction in wages. That reduction, nevertheless, came, but still the action of the men was diverting trade just as much as if they had been moving for an advance.

9623. In point of fact the operation of the union on trade on a large scale has been in the main this, to resist a gradual reduction of the rate of wages which has been going on since 1863 for the purpose of meeting the greatly lower prices of the Belgian and French manufacturers ?—Yes, and in consequence of diminished demand for iron.

9624. (*Chairman.*) I understand the effect of it to be that that which would have been 7*s.* wages when iron has been at 7*l.* per ton has been really 8*s.* ?—Yes.

9625. The action of the union has been for a certain time to get one-eighth more than the current rate ?—One shilling more.

9626. That has not been temporary, but it has been always the case since the time you speak of ?—And is so at the present time.

9627. (*Mr. Hughes.*) Not throughout the country, not in the north, is it ?—No, because prices in that district are not regulated in that way. I am speaking of Staffordshire. The official price of iron is 7*l.* 10*s.* now in Staffordshire, and the price of puddling is 8*s.* 6*d.*

9628. (*Mr. Harrison.*) Was not the Puddlers' Union established after that rise ?—No.

9629. Are you quite sure of that ?—The 6*d.* was obtained, I think it was in 1860, but I am not prepared to say exactly when it was. I have no information as to how it was, but certainly 6*d.* of it was obtained after the strike of 1863, 6*d.* extra was the result of that strike.

9630. What is the date of the Puddlers' Union of which Mr. Hobson is representative ?—It was certainly formed before that strike of 1863.

(*Mr. Hobson.*) It was formed during the strike.

9631. (*Mr. Harrison.*) My impression is that the union was not in existence when the increased rate was given ?—It may not have been in existence in the same form as now, but then it was a union of the men. It might not have been that it bore the exact name and had the exact organization of the present time, but it was a union movement that originated the dispute. There was a distinct organization on the part of the men in South Staffordshire (one part of the men supporting the other part) by which they picked out certain works, and said "such and such works are to "be put out and the men at the other works are to "send contributions to these men to support them." The masters being quite aware of that policy agreed to support those masters where the puddlers were out on strike by sending them puddled bars to work at their mills.

9632. That applies only to the second 6*d.* ?—Yes.

9633. I see that in your paper you mentioned a point upon which you may be glad of an opportunity of making some little correction, namely, with respect to the benefits. You say that nothing appears in the accounts which are made out by the union, except sums spent for trade purposes. That, I think, you know has been explained by the statement that it appears in the lodge returns, which you had not before you. But are you now aware what the benefits are which are given by the Puddlers Union ?—I have no evidence of anything except the statement that was made that funeral allowances are given at the different lodges.

9634. I am informed that there is a superannuation allowance, a non-employment allowance, and a funeral allowance as well ?—It may be so now. I think that must have been introduced recently. I do not recollect anything about it in the rules of the Brierley Hill union sometime back.

9635. You say in the second column that the sums paid by the men in the support of unions, perhaps, reach 2*s.* or 3*s.* a week. You do not mean that that is the ordinary weekly payment to the union ?—The ordinary weekly payment is 1*s.*, but there is extra payment for levies as I find stated in the report of the conference. I think a delegate from Darlington stated that he had paid 2*s.* 6*d.* a week. Those contributions are raised from time to time according to the strikes which are going on.

9636. Do you know that the action of the union has been employed with great success in the saving of waste in the puddling department, by insisting upon the men bringing out the puddled iron with as little waste as possible ?—It is always their interest to do that; the interest of the men in that respect would be stronger than the interest of any union, because if a man did not bring out his work with as little waste as possible, it would influence his wages; and therefore without the influence of the union he must always have the strongest interest to do the best he can. I do not think that the union would strengthen that at all.

9637. (*Mr. Mathews.*) Is not the supply of iron to each man in the puddling furnaces uniform throughout the works ?—Yes.

9638. (*Mr. Harrison.*) I will put the thing in this way; are you aware that the union has materially interfered to prevent its members from following the dishonest practice of stealing iron in order to make up their own yield ?—I have no case in point; I will not say that it is not so, or that cases have not occurred, but I have no information of any.

9639. I have here a resolution which was unanimously carried at a general meeting of the Puddlers Association of the date of February the 10th, 1866, "Moved by Joseph Hawkes, and seconded by "Thomas Tromans, That this meeting recommend "all officials to use their influence to put a stop to the "obnoxious system of puddlers fetching iron (either "scraps or castings) 'puff,'" (that is the technical term) "and that a fine be inflicted upon all members "who disregard a resolution made by the members "at the respective works, 'for no puddler to charge, "'or put into his furnace more iron than the manager "'orders to be sent in to be worked at one heat, (*i.e.*) "'400 cwt. of pig iron.' In consequence of the "system both reflecting discredit upon the workmen, "and doubtless will have a tendency of proving "detrimental to the reputation of the association in "not endeavouring to have such a system abandoned." Are you aware of such a resolution having been passed ?—No, I am not aware of it, but that relates to Staffordshire, and therefore the gentlemen connected with Staffordshire will be better able to speak to it. If evidence is put in as to any income from the operation of that rule that would at once settle the matter; but those fines not relating to the masters, we could not know anything about the men inflicting them.

9640. (*Chairman to Mr. Hobson.*) Do you know anything about this rule being put in force at all ?—Yes, it has been strictly carried out at Messrs. Brown & Freer's works. Since the last reduction the men have fallen away from the union, and the employers have had to resort in two cases to a fine, which did not occur after that resolution was passed. Each workman then determined to give evidence against a workman who fetched any extra iron. Since the union however has fallen off the employers have now had to enforce fines for the action of fetching extra iron.

9641. (*Mr. Harrison.*) What was the fine ?—2*s.* 6*d.* That resolution recommends that the officers of each works shall pass a similar resolution, in order that it be unanimous; I believe that to a certain extent it was so. Mr. Arkinstall, of the Bromford Works, stated that if the men would institute fines for fetching the extra iron he would add

something to it at the end of the year, and the fines could be appropriated to a supper. He said that if the men objected to pay the fines, then if the union officials would apply to him he would enforce the fine or the workmen should leave the premises.

9642. (*To the witness.*) Can you give me now any calculation as to the proportion which the wages paid upon each department in the manufacturing of a ton of bar iron bear to the selling price of the iron?—I could not say upon each department. I made a calculation with regard to the wages for a ton of iron and I think it will vary, at least my own impression from what I know of the different districts is, that it will vary from 5*l.* to 5*l.* 10*s.*

9643. The selling price being 7*l.*?—The price being 6*l.* 10*s.* There will be 1*l.* margin for things which do not enter into the question of wages at all.

9644. I should like to know how you make that out. The cost of the puddling of bar iron we know is 8*s.* 6*d.* a ton?—Yes, on a ton of puddled iron; but it takes a good deal more than a ton of puddled iron to make a ton of finished iron.

9645. Would you just take each of the items on which that 6*l.* 10*s.* is made out?—It would be impossible without taking the whole wages scale of a works. In producing a ton of bar iron you have (I have not gone into the matter as to how many, but I should think) 50 different classes of men employed in works. If you take charges that are not wages you get at it more reasonably. For instance, take the royalties on all the minerals used in producing a ton of finished iron. I should say that you required pretty nearly 10 tons of minerals of one kind and another (that is taking the coal, the limestone, the ironstone, and all the other things used) in producing a ton of finished iron. Now in our case in the North of England we should have to pay at least 10*s.* a ton, and in some cases more (10*s.* a ton under the most favorable circumstances) for the carriage of these minerals alone. Half of that may be fairly taken to represent the profit of the railway company, and one-half would go to wages; that would be 5*s.* And the royalties, speaking roughly, the ironstone, the coal, and the limestone would be another 10*s.*; that makes 15*s.* Then as to other charges which would vary in different districts, it is very difficult to strike an average, because each district differs from the others, and in some cases they have not to pay so much for the carriage, because the iron mines are pretty near to the furnaces.

9646. You have made a calculation, and I only ask you the grounds upon which that rests. I want to know how the 6*l.* is made up?—Each works has its different costs. You can only get to a sort of average.

9647. I ask what the calculation is made upon?—The first calculation is to take a works and find out the amount of finished iron produced, and the amount of money paid in wages. That gives you the amount of wages per ton of iron in that particular department, but then you have to take into consideration the coal and everything on which the wages come.

9648. (*Sir D. Gooch.*) The easiest way is to take first the cost of the raw material?—Yes, if you want to find out what the cost of a ton of iron is you get that from the cost sheets. They will differ in different works, and you have to strike the average, and of course the cost sheet in one district would differ from the cost sheet in another. But supposing the cost sheet to be 6*l.* 10*s.*, and you work out what expenses there are that cannot possibly be brought to wages, that is royalties, railway charges, profit, and so on, it will be found that 1*l.* will on the average about cover all those matters; in some cases it will be a little more, but in some cases a little less.

9649. (*Mr. Harrison.*) "Wages" is rather a wide term; of course, it may be used to mean the wages which are paid to men anywhere in the country who have to deal with any of the materials used, but I am speaking of the wages paid by the person who manufactures that particular thing?—Then in that case, you must take the man that raises his own ironstone and his own limestone.

9650. I do not want to take that?—Those are all items in the cost of iron.

9651. I will give you this case. Take the case of a firm whose work consists mainly (as I believe in some cases in Staffordshire it does wholly) in the manufacture of bars. They buy their pig iron, and they sell their bars. Would you tell me what proportion out of the 7*l.* 10*s.*, which is the price they get for the bar iron, represents the wages which they pay to the men whom they have employed in the manufacture?—That in itself would vary according as the works were making plates, or making small bars or railway bars, and so on. But speaking roughly, taking the different departments, I should think that it would vary from 2*l.* to 2*l.* 10*s.*

9652. The cost of the pig iron being how much?—The cost of the pig iron varying also in the different districts. In the North of England district, probably by the time it gets in the works you may take it at 2*l.* 5*s.*; in other districts it would be perhaps considerably more. Then you have to take all the coal into account, and all the establishment charges, and so on, in getting up to the cost of the iron. But taking the wages alone in a rail mill, producing a large quantity, I should think that in most instances they would be two guineas. I am speaking now without having gone accurately into all the details.

9653. (*Mr. Mathews.*) With your experience, is it practicable for you to answer these questions? Is it not rather the business of an ironmaster?—Quite so.

9654. You have not been in the habit of going into all these details?—No.

9655. Therefore you can only speak very generally and very imperfectly on them?—Yes.

9656. (*Mr. Harrison.*) I am afraid that I have not made myself quite understood. Of course I am aware of the great varieties there are, but you having given us a calculation, I want to know what you have taken as the basis of it?—I think you will find that I said that Mr. Mathews had stated with reference to the evidence given by Mr. Kane or some one else who was examined, that the wages would be about 5*l.* 10*s.*, and I said what I did assuming that that calculation was correct. I did not say that I myself had made that calculation. But now I say that I can clearly make out that that is about correct. The cost of making a ton of iron will differ in different districts, but if you take everything into consideration I calculate that 1*l.* at all events will cover those charges where there are no wages concerned. In the cost of turning pig iron into bar iron there must be say two guineas a ton in simply converting it, that is, simply the wages, without taking into consideration fuel or anything of that kind.

9657. When you say that such and such is the amount paid in wages, if those wages are to include the wages of all the men who work in the quarries and get the ironstone out, the wages of the railway officials who bring it up, and the wages of every one who is engaged directly or indirectly on it, then the obvious answer is that those persons wages are not in the slightest degree directly or indirectly affected by a fall in the price of bar iron?—That is not so, because in Staffordshire a reduction of 1*s.* in the price of puddling in the furnaces affects the colliers, and the same thing applies in Wales. It goes all through the collieries and the ironstone mines and the blast furnaces.

9658. I want to know what proportion of the wages paid are such wages as are directly governed by a rise or fall of the price of the bar iron?—Everything would be taken out, except the charges on railway transit, and in many cases very little would cover them. In our district a good deal has to be allowed on this head, and in the north the railway company have generally met the trade in this way; trade being depressed, they have made a temporary reduction of 10 per cent. In several instances they have done that because the iron trade has been in a depressed state, and when there has been a reduction of wages,

Mr. J. Jones.
27 Nov. 1867.

there has been a reduction on the cost of carrying the minerals, and so on. Therefore, all classes of wages connected with the iron trade would be touched.

9659. Do you mean to say that the wages of the stokers, for instance, were reduced?—I do not say that, but the railway company have reduced the charges; railway charges on minerals, however, are a very small item. I should think that they scarcely come in in Staffordshire at all; in our district they do.

9660. All I should like would be a detailed statement with reference to this subject, and perhaps a subsequent witness will be able to furnish it?—It is a very complicated question; it could only be furnished by taking the royalties, and so on.

9661. (*Mr. Merivale.*) I understand, if I am right (you will correct me if I am wrong), that in your opinion the general result of the unions since the year 1863 has been somewhat to raise or keep up wages, but that that advantage, such as it is, has been wholly or mainly neutralised by the expenses of the unions?—Quite so, and by the shortening of work owing to the diversion of trade.

9662. Then, if so, am I right in saying that the net result is this, that through their operations since 1863 masters have lost something, secretaries and others to unions have gained something, and workmen are left pretty much as they were?—As far as the actual earnings are concerned that is my opinion.

9663. In addition you are of opinion that a great portion of the business has been diverted abroad?—Yes.

9664. Can you furnish us with any statistical or other information as to the amount of that diversion, or are you speaking merely from a general impression which you would naturally have, because of course you must know a good deal in that way?—A good deal might be said on that point, because statistics have been published showing the fact.

9665. From your own papers or from your recollection, can you give us a general idea of what the amount of the diversion has been in the last five years?—I cannot estimate the amount of the diversion. I have not estimated it there in the book which you have before you. It is a very difficult matter to get at. But we do know this, that foreign iron has even come in to compete with ours in our own district, and that buyers on the Tees have actually had quotations from Belgium at lower rates than could be quoted by the works in the locality.

9666. And they have acted on those quotations?—Yes, they have actually purchased.

9667. You cannot at all tell me to what extent that has been the case?—That is a difficult matter.

9668. (*Chairman.*) I understand you to say that buyers in the same market have taken a Belgian article in place of an English article?—That the buyer of iron, the consumer of iron, in an English manufacturing district, is able to buy manufactured iron from Belgium, delivered at his own works, at lower rates than have been quoted by makers in the immediate locality.

9669. (*Mr. Merivale.*) Not only is he able to do it, but it has been done, you say?—Yes. These facts were published some time ago with respect to Belgium. The exports of four descriptions of iron from Belgium to Great Britain were as follows:—In 1862 they were 1,777*l.*, in 1863 1,946*l.*, in 1864 75,648*l.* You will notice that that was just about the time when the price of wages went up so very much; and in 1865, 99,950*l.*

9670. Are you aware yourself of any improvements cheapening in the Belgian mode of manufacture which would in any way account for that?—I am not aware of any. I know that they purchase a good deal of the pig iron from our district on the Tees, and they can send it back to the Tees when manufactured and compete with our own manufacture.

9671. Supposing that there is a certain amount of money thus put into the Belgian pocket, is the result this, that the whole of what the Belgians have gained through the operations of the unions since 1863 is so much lost to the masters here?—It has not all been lost, but very largely so.

9672. Somebody must have lost it?—Quite so, but all that money would not be dead loss.

9673. If it had not been for the operation of the union the masters here would have got it, you say, as I understand you?—No, the masters would have had to pay a portion of it away in wages. They would have lost that much custom but not that much money. Supposing iron has been manufactured in Belgium to the extent of 100,000*l.*, it does not follow that the masters here have lost all that money, but they have lost their portion of that money.

9674. (*Mr. Hughes.*) With regard to those years as to which you have read us the increase of the Belgian imports into England, have you compared the general increase of the English manufacture in the same time?—It would have increased very considerably; probably I have given it in my article in the British Almanac Companion, I cannot recollect whether I have or not.

9675. Are you aware as to the decrease of the last year in our original exports of iron, whether in fact there has been a decrease on the export of iron in 1866, say over 1865?—No, I think that there has not been a decrease in our export trade—it has been chiefly in the home trade that the falling off has occurred.

9676. You say that some portion of your evidence was founded on what was stated in conference by the union, was any report published of that conference?—Yes, there are published statements of theirs that I have read something from already.

9677. Have your association published any such statements of conferences?—These are statements published for their own members.

9678. You say that you have seen reports of their conferences, and I wish to know if there are any similar documents of your own society?—No.

9679. You have not published the reports of any conferences at all?—We have had no conferences; we have simply had meetings.

9680. Those are conferences, in a sense, I suppose. When something has to be settled you have a meeting?—Yes.

9681. But you do not publish any report of those meetings?—Except that we circulate minutes to the members.

9682. Printed?—Mostly printed.

9683. Have you any which you could furnish us with?—Yes; they are simply minutes of our proceedings; but these reports of the men are rather different. As I understand it, these reports of conferences are the reports of general meetings of delegates from the different parts of the union districts, and they are not simply the reports of local meetings.

9684. You have something equivalent to delegate meetings; you have meetings at which you settle what your association is going to do to the other association?—Yes.

9685. Have you any reports of those meetings?—We have simply printed minutes of each meeting.

9686. I should like to see one or two of them as specimens?—These are the minutes of the last meeting (*handing in the same*). They just happened to come to me this morning among my letters, and are the minutes of a meeting held the other day.

9687. I see the first arrangement that is agreed on here is that the price for puddling is to be reduced a shilling a ton?—That is in connexion with the notices of reduction posted up.

9688. What reduction? Has the price of iron fallen, and is iron now selling at 1*l.* a ton less than it was in October, or when the last sheet came out?—These meetings are held at any time. As far as the price of iron is concerned, you must go to what prices are actually taken.

9689. You told us just now that iron was selling at 7*l.* 10*s.*, did you not?—No, I said that the list price in Staffordshire was 7*l.* 10*s.*

9690. This association of yours fixes that the price of puddling shall be reduced a shilling a ton. I want to know whether the price of iron fell 1*l.* a ton?—The price of iron has fallen very much more than 1*l.* a ton, compared with what it was a few months ago.

9691. I will put it in another way. Has the reduction of wages been *pari passu* with the fall in the price of iron, or has it exceeded it, or has it been less?—I think that the reduction in the price of iron is really more than is represented by that reduction in the wages mentioned in those minutes and which will come into effect in a little over a week. If you ask me what the price of iron in the North of England is now, I can only say that, taking for instance this East India contract, to which I have already referred, nearly all the makers in the North of England tendered for that. It was a contract for 14,000 tons of rails, and I believe that the price at which that has been taken, speaking from the best information I can get in the matter, is that it is to be delivered at Liverpool at 5*l.* 17*s.* 6*d.* per ton. The railway charges on that are 11*s.*, and probably there is a commission also, so that we may take it that the money which the employers will obtain cannot be more than 5*l.* 5*s.* per ton. Now that is a very superior kind of rail, which has to stand a very severe test, and if that is the price for that rail, I am quite certain commoner rails can be obtained for at least 10*s.* a ton less.

9692. Then the ironmasters' meetings do not really fix the price?—No, we never fix or attempt to fix prices.

9693. I thought you said just now that they were settled at 7*l.* 10*s.*?—Yes, but that is Staffordshire; this is in the North of England.

9694. Leaving Staffordshire out of the question, do you mean to say that in the North of England wages have fluctuated proportionately during the last three or four years with the fluctuations in the price of iron; do you mean to say that they have gone up as much as iron has gone up at certain times, and that they have gone down as much as iron has gone down at other times?—I mean that they have gone up as much but not gone down as much, because at the present time the price of iron is remarkably below anything that would be represented by the price of wages.

9695. Was it not also at one time very much above?—No, I never remember seeing any quotations of iron being more than 10*l.* 10*s.*, and puddling wages were 10*s.* 6*d.* At the present time the average price of puddling is 8*s.* 6*d.* in the north, and with respect to the average selling price of iron, if you take cable iron, which is a very good kind of iron, one of the best varieties of it has been for a long time selling on the Tyne at prices which would leave considerably under 6*l.* to the manufacturers, whereas they have been paying at the same time on the average 8*s.* 6*d.* for puddling.

9696. During the last three or four years the advances have been made by the masters as the prices rose, have they not?—Yes, about the same time. I do not know the exact period in the North of England because I was not in the North of England then, but in 1863, I believe it was, there were three advances, from 7*s.* 6*d.* up to 10*s.* 6*d.*

9697. That 1863 advance in the first instance was forced as you said last time?—It was forced in Staffordshire, and notices I think were given in the North.

9698. (*Mr. Mathews.*) I think that before you went to Middlesbro' you were assistant secretary to the South Staffordshire Ironmasters' Association?—Yes.

9699. In addition to your occupation as assistant secretary there, you had various other occupations, and have now I believe, connected with schools and workmen's institutes, and other establishments?—In South Staffordshire I had, but in the North of England I have no appointments connected with the educational work of the district, though I hold other public appointments.

9700. Of the educational establishments in South Staffordshire you can speak from intimate acquaintance?—Yes.

9701. Is there in the South Staffordshire district an abundance of schools generally speaking for the education of all the population?—Yes. At a recent meeting I saw it stated that there was accommodation for a very much larger number of scholars than are actually in attendance at different towns in the district.

9702. There either is an abundance of educational means for the population in South Staffordshire, or the ironmasters are always ready to assist in providing it?—Yes, I may mention that I was for a considerable length of time secretary to the Iron and Coal Masters Prize Scheme Association, which did a great deal to promote the efficiency of the schools in the district. Mr. Williams, the honorary secretary to the association, was I think mainly if not entirely, the originator of that scheme, and the subscriptions that have come to it have been from the iron and coal-masters of the district.

9703. Are the iron and coal masters of South Staffordshire principally the means of promoting those schools?—Yes; a considerable number of them have established schools, though there are difficulties in the way of their doing so, owing to the scattered population. It is difficult to centre all the population of the mines and ironworks in one place, but notwithstanding that, a considerable number of firms have established schools, and support them entirely.

9704. Schools exclusively for their own works?—Mainly; others may be allowed to come, but still they defray all the expenses.

9705. I daresay you know that several of the larger establishments in South Staffordshire have schools exclusively attached to their ironworks?—Yes.

9706. And that there are also hospital establishments, and various other means of that sort, for attending to the numerous cases of accidents that occur in South Staffordshire?—Yes.

9707. And those are generally supported by the South Staffordshire iron and coal masters?—Yes.

9708. So that as far as the social duties of the South Staffordshire ironmasters in their connexion with the workmen are concerned, they endeavour to act up to them to the best of their ability?—I have always believed that they have done so; the facts are certainly very abundant to prove it.

9709. Previous to the establishment of these unions, in case of a dispute about wages or other circumstances between the workmen and their masters, was there any difficulty on the part of the men in having free personal discussion with their masters on the subjects arising from time to time?—I never heard that there was.

9710. The general impression was that whenever the workmen had a grievance, the masters were always ready to discuss it personally with their men?—Yes; it was so previous to the establishment of unions.

9711. Has that been in some degree restricted since the establishment of the unions by the intervention of the officers of the unions taking upon themselves to negociate with the masters instead of allowing the men to do it themselves?—Yes, I have heard that that is so. In many instances the masters do not object to meet their own men, but have raised very strong objections to meeting representatives not connected with their own works.

9712. As a rule, they dislike to have other people not in their employment interfering between them and the men who are in their employment?—Yes; I believe that that is the general feeling.

9713. With respect to the hiring, I will take the case of puddlers, because that is the staple department on which wages generally are fixed for other departments, is it not?—Yes, it is so; it is the only department upon which you can institute a comparison.

9714. In the case of hiring a puddler, is it usual to hire him at a certain rate per ton, the puddler finding his underhand, subject to a certain notice, say 14 days

Mr. J. Jones.
27 Nov. 1867.

notice, to be given either by the master for discharging the man, or by the puddler for resigning his place?—Yes.

9715. And when the relation between the master and the puddler is established at a certain rate per ton, that rate influences all the other departments in the works?—Yes.

9716. In the case of a rise of the puddlers' wages, the rise extends through all the works, generally speaking, through unskilled labourers included, and so in the case of a reduction, the reduction extends through all departments?—Yes, and generally even to the blast furnaces and to the collieries.

9717. So that when we speak of a rise or fall in the price of wages, it means a rise or fall in the price of puddlers' wages?—Yes, that is the standard governing all the other wages in the trade in that district.

9718. I think you stated that the relation which existed formerly between the price of puddling and the price of iron was 1*s.* a ton for puddling per 1*l.* a ton in the price of iron?—Yes.

9719. Whenever the price of iron rose the price of puddling followed in the same degree?—Yes.

9720. And whenever the price of iron fell the price of puddling fell in the same degree?—Yes.

9721. But whenever it got down to a certain point, say 6*l.* 10*s.* for iron in South Staffordshire, there was no further reduction in the wages of puddling?—I never heard of a reduction below 7*s.* 6*d.*

9722. So that there was an unlimited area in rising and a limited area in falling?—Yes.

9723. Then you speak of the price of iron as being regulated by the Iron Trade Association; do you not mean the species of iron which you call marked iron?—Yes.

9724. Which only a few houses can make?—Yes, not more than seven or eight.

9725. And which is confined to Staffordshire?—Yes, it is a speciality of the Staffordshire district—marked bars.

9726. That description of iron is made exclusively in South Staffordshire by a few firms who have established a reputation which has lasted for a great number of years?—Yes.

9727. And whose brand is well known?—Yes, there may be some particular manufacturers in other districts who are somewhat similarly situated, and theirs forms an exceptional trade.

9728. But the great bulk of the iron trade in South Staffordshire is not confined to the price fixed by these marked brands?—Certainly not.

9729. The sellers of the marked brands do not require the other makers who have no marked brands to adhere to their price in any way, do they?—No.

9730. In many instances the sellers of iron of inferior brands in South Staffordshire sell at 1*l.* or 2*l.* less?—Yes.

9731. And the makers of the marked brands, except for some conventional understanding; can sell lower than the price of the marked brands if they choose?—Yes.

9732. No restriction is put upon them?—No.

9733. (*Mr. Hughes.*) What then is the meaning of the marked brand being the fixed price if any of the makers can sell at any price they like?—It is simply that it is a convenient mode for regulating wages.

9734. Who is bound by it; is anybody?—Nobody at all.

9735. Then there is no meaning in it?—Except that these marked brand makers as a rule always adhere to those prices. They represent the value of that particular kind of iron.

9736. It is a voluntary agreement to sell at that price if they can get it; is that all that they mean?—It only applies to these marked makers. I do not know that they are in the habit of selling at all below these prices, but they may do so.

9737. I understand you that the prices of these few firms who sell with a marked brand are published periodically?—Yes.

9738. Do they adhere to them or not?—I think they do, but they are not compelled to do so. If they sell at 5*s.* a ton under those prices there is no one to prevent them. It is just quoting a market price. If you quote a market price for anything on 'Change it does not follow that everybody must adhere to that price. That is considered to be about the fair price of that particular kind of iron.

9739. As far as you know there is no obligation whatever upon the firms who sell with marked brands to sell at the price of the published list?—Not at all.

9740. (*Sir. D. Gooch.*) But the puddler gets the full advantage of the high price?—Yes.

9741. (*Mr. Mathews.*) The high price being in point of fact the basis on which the puddlers' wages are calculated?—Yes, and that is why it has been retained so long. If it was found that the market price of iron was increasing then putting it up 1*l.* would represent the highest class of iron made in the district and the highest prices that could be obtained, and the prices of puddling would go up a shilling a ton all over the district.

9742. (*Mr. Hughes.*) But supposing one of these marked brand manufacturers to sell iron, say 2*l.* or 3*l.* under the price of the marked brand, would he go on paying his puddlers according to the marked price?—Yes; people selling at 1*l.* or 25*s.* under this marked price are still paying the same wages, the 8*s.* 6*d.* per ton, therefore it never can act except in favour of the men.

9743. So that in fact this published list is a benevolent arrangement in favour of the puddlers?—I do not suppose that it is meant for that.

9744. It comes to this that they are the only people who really benefit by it apparently?—No, it comes to this, that you fix the top prices, and it is well known in the trade, and any consumer of iron knows that certain makers are, as a rule, selling 5*s.* a ton under the list price, that in fact is their list price, and when the price of iron goes up 1*l.*, their particular relative price would go up 1*l.*, and therefore, quoting 7*l.* 10*s.* for instance as the list price, leads the consumer to know exactly what the prices of all the firms in the district are.

9745. But the only people who necessarily benefit by that are the puddlers?—The ironworkers as a body.

9746. You say that the wages generally are settled by the puddlers wages, therefore we speak of the puddlers as representing the wages earned?—Yes, it is so.

9747. (*Mr. Mathews.*) There is no question of benevolence involved in this arrangement, I think, is there?—No, it is a purely hard business matter.

9748. In this arrangement there is no profession of benevolence on the part of the masters or acceptance of benevolence on the part of the men?—No.

9749. It is simply a convenient standard of prices. If a man with a marked brand is selling at 7*l.* 10*s.*, and the price goes up, then the price of the inferior brands goes up in the same proportion?—Yes.

9750. The nearest approach to uniformity is in the price of the marked brands, and therefore that is the best ground on which to base uniformity of wages in the case of puddlers?—Yes.

9751. That being so, when the puddlers are discontented, what is the usual practice that the union have suggested to the puddlers, has it been to fix upon one or two works to strike at first?—That was the case in 1863 markedly.

9752. What was the course they adopted upon that occasion?—It was to single out a certain number of works, and I believe that they were guided to some extent by what they thought to be the stability of the firms, and they picked out those firms where they thought they would have perhaps the best chance, and it was for the workmen engaged by the other firms in the district to support by the payment of a pretty good levy these men while they were out of work.

9753. That is to say, they fixed upon one or two works, not the stronger works of the district but what they thought weaker works?—Yes.

9754. And while they were out on strike at those particular works, the men in the other works in the district made a weekly contribution for the support of those men who were out on strike?—Yes.

9755. Was not that policy extended in the case of the North Staffordshire strike of 1865 to districts instead of individuals?—Yes, instead of a few isolated works in one district, the smallest district was put out.

9756. North Staffordshire being a smaller district than some of the other districts for a strike, they fixed upon that as cheaper to their funds than a large district like Middlesbrough or South Staffordshire?—Yes.

9757. And they persevered in that process in the hope that the north Staffordshire masters would be forced to give way and that then a rise would be compelled from the other districts then at work at a lower rate?—That was undoubtedly the policy.

9758. You have been asked some questions about the proportion of the price of labour in a ton of iron to the other charges. Taking an iron works who make their own pig iron and have their own ore, the first charge is the charge for royalties on minerals?—Yes.

9759. And all subsequent charges consist in the name of labour except a few trifling articles which constitute the fixed charges?—Yes, depreciation of machinery and all those things come in as fixed charges.

9760. What the proportion of the labour is it is exceedingly difficult to define in each particular case?—It must differ in each particular case and specially in each district.

9761. Scarcely any two works are alike with respect to the relation of the charges?—I should think that no two works and no two districts are alike.

9762. I have a paper before me professing to show those details. Although this may be correct in the main, the circumstances vary in each particular works according to the facilities or conveniences attaching to those works?—Yes.

9763. (*Earl of Lichfield.*) Those returns are made up from information from the Chamber of Commerce, or wherever the information comes from, I suppose?—That applies to no other district except South Staffordshire.

9764. (*Mr. Mathews.*) Then generally speaking, taking the price of bar iron at 6*l.* 10*s.* the fixed charges upon a large ironworks would be from 10*s.* to 20*s.*, according to the circumstances of the works?—Yes.

9765. But all the rest must necessarily be labour and nothing but labour?—Yes.

9766. Therefore, assuming that to be the case it is absolutely necessary in the case of a reduction in the price of iron to reduce wages to meet that reduction? Yes, and the wages ought to be reduced through the pig iron, and through the coal too.

9767. And that is generally the case?—That is generally the case; it is not the case in all districts.

9768. In the case of a works which raises its own minerals it would be the case?—Yes, there it would go through all departments.

9769. If the price of iron were to fall 20*s.* a ton, and the ironmaster were to retain the rate of wages which he paid previous to the fall, if a large work it would very soon either bring his work to grief or cause the ironmaster to stop production?—Yes.

9770. So that it is not a mere caprice on the part of the iron masters when he lowers the wages, but an action of self preservation?—Yes, and there comes a certain point at which he would find it absolutely beneficial to close his works.

9771. Even if he had reduced his wages as far as he could?—Yes.

9772. He is compelled, you mean, to restrict his make very materially or stop his work altogether?—Yes; that is the case even now. There are instances that could be mentioned where they are working at a price very considerably under the cost price of the iron, but that is preferable in their case to ceasing work with the heavy standing expenses of the works, because the loss per ton of iron by reason of the actual standing expenses would be greater, supposing they were to stop altogether.

9773. It often happens, does it not, that an ironmaster goes on for a considerable time working at a loss rather than incur the very heavy expense of stopping his works altogether?—Yes, because the standing expenses in connexion with an ironworks are really very heavy.

9774. You spoke of the cost of labour in ironworks here compared with the cost of labour in Belgium, do you know what the relative difference is between the two, what the rate of wages in Belgium generally is compared with the rate of wages in this country?—To speak candidly I am not prepared to answer that myself, because I have depended mainly on the statistics of gentlemen who have visited Belgium.

9775. You say that there is an exportation of iron from Middlesbrough to Belgium?—Yes.

9776. That as manufactured iron, being returned in some small quantities to England, but being sent in a very much larger proportion to the continental countries, supersedes the English iron in the continental markets?—Yes, in Belgium and Prussia.

9777. Although the proportion brought back to this country is not very considerable, it serves to keep down the price of English iron?—Yes.

9778. And therefore it serves to keep down the price of wages in some degree?—Yes.

9779. There is no doubt of the fact that Belgian iron has superseded the English iron on the continent?—No, and a good many things from Belgium are coming here. I believe that some of the large nail merchants in Birmingham buy goods from Belgium. It is well known that the neighbourhood of Birmingham, Dudley, and all round there, has been for some time the head quarters of the nail trade.

9780. You mean that a Birmingham merchant would buy nails in Belgium for exportation to foreign countries, shipping them at Antwerp, and so supersede the labour of the English market entirely?—Yes, Birmingham merchants are buying now very extensively from Belgium for that very purpose.

9781. I ask that question because a Birmingham merchant told me that he had been in the habit of paying 12,000*l.* a year for nails in the neighbourhood, and that last year he only paid 500*l.* there, because he had bought most of them in Belgium and had them shipped there?—I have heard those figures stated.

9782. When there has been a request for a large contract, say for the Russian Government, that has been generally taken by English houses, I think, for some years past?—Yes, almost invariably it used to be.

9783. The Dowlais Works, in South Wales, generally had the greatest proportion of the Russian contracts, for instance?—Yes, the rail orders came there; to Ebbw Vale and the large houses in Wales and the North of England. We have had in the North of England a considerable portion this last year.

9784. Has it not been the fact that lately a large contract has been taken for Russia by the Belgians?—Yes.

9785. To what extent?—I am not aware. I have seen it stated that they are now mainly occupied with these Russian rails.

9786. Are you aware of any Belgian or Prussian rails having been bought for the English railways?—I cannot speak of that further than what I have heard of it.

9787. You were asked a question about the emigration of puddlers. It is never the practice, is it, of the ironmasters either in South Staffordshire, Middlesborough, North Staffordshire or elsewhere, to interfere with the puddlers or other workmen in the slightest degree with respect to their desire to emigrate?—No, they have no means of doing so, and no wish to do so as far as I have heard them express an opinion.

Mr. J. Jones.

27 Nov. 1867.

9788. On the contrary if the masters consider that they have some puddlers connected with these unions who give them more trouble than other men, is it not their desire to encourage the emigration of such men?—The general impression is that those men who are desirous of going away are those which give the most trouble.

9789. There is no sort of hindrance placed in their way by the ironmasters to induce them not to emigrate?—No, I do not say that those who have gone have given more trouble, but that that is the general impression.

9790. Without going to particular facts, there is no disposition at all on the part of the masters to put any obstacle in the way of their going abroad if they like?—No; but very few have gone abroad comparatively speaking.

9791. But if they were to go abroad and thereby lessen the labour market (which is the impression the puddlers have according to all accounts), and thereby the puddlers remaining behind were to get a higher price for their labour that would affect other labour as well as the puddlers, I suppose?—This matter of emigration must be very much more marked before it could have any effect. But their impression is, that by sending a dozen men out (at least they would lead people to imagine so) they could affect wages through the whole district. I believe it is said that in one case 20 went, and out of the whole number in the country that is very small.

9792. Supposing that the object of sending out these men was to raise the wages of those remaining behind, would it place the men in a worse position with respect to their employment, considering that although they got a higher rate of wages they would have less employment than they had before in consequence of a lower price obtaining in other districts?—The men going abroad would soon bring down the price there and would place the master abroad in a much better position to compete with the master in England, and therefore they would still bring down the price of iron, and wages would come down in this country in that way.

9793. If the ironmasters found that that really had the effect of raising wages, could they not remedy that by bringing forward the underhands and making them substitutes for the puddlers?—That would soon have remedied the matter.

9794. I believe that that was the case during the strike in North Staffordshire?—A great number of under hands became puddlers, and it was so also in the North of England strike; a considerable number were introduced then.

9795. So that, though there is no impediment placed in the way of emigration on the part of the South Staffordshire ironmasters, or the North Staffordshire ironmasters or the North of England ironmasters, they do not apprehend any advance of wages through that operation?—No.

9796. The machinery is too feeble and incompetent to effect such a result?—Yes, it would take an immensely larger amount of emigration to effect any alteration.

9797. What is your opinion of the social relation of the ironmasters to their men in South Staffordshire previous to the establishment of the unions and since the establishment of the unions?—My impression is that there has been a very strong breach created between employers and employed during the last few years.

9798. That is to say, the men have been placed in a much more atagonistic position to their masters and the relations that have existed between them since the establishment of the unions have been less cordial than they were before?—Yes; I may just mention a circumstance in connexion with that. A working man, or a person who has been a working man, wrote to me sometime ago, and he brought a case of this kind before me. I shall suppress the name, but I believe that the works in question had always got on tolerably well with their men. This is what he says: "I will "just relate to you the effect of the union upon the "men employed at these works, just previous to the "Messrs. ———— taking to them. It was on a "Saturday morning, after the night turn had finished "work, when the secretary of the union in connexion "with the works went to the manager and accosted "him in the following manner: 'I say, Gaffer, you "'musn't think you are going to do as you like with "'these men because you won't; I'll let you know "'I'm secretary over these men, and they'll do as I "'like, and not as you like;' and the only fault "belonging to the manager was that he was too easy "and quiet. I have just mentioned this to show you "an instance how arrogant and unreasonable the "trades union tends to make a large number of its "members." The writer further says, "But in a "very short time this secretary was detected in mis-"appropriating the contributions, and now there is "not one in the whole of the works that is a member." I speak in general terms in my paper, but I think that that is an instance, perhaps, showing the kind of feeling that there is. There has been a great breach between the masters and the men, occasioned by, perhaps, the injudicious action of some of these officials. I am not speaking of the general union, but of the union connected with each of the works.

9799. That is to say, in consequence of the interference of the unions there is a less cordial and friendly relation existing between the masters and their workmen than there used to be?—Yes.

9800. There is a disinclination on the part of the masters to deal with the officers of the union, and the influence of the officers prevents the men coming in contact with their masters directly?—Yes.

9801. Are you aware whether it is the habit of the unions to dictate to the masters what particular kind of manager they shall employ?—I have plenty of evidence here of cases where managers have been objected to.

9802. That is, the men say they will not work under such and such a manager?—Yes.

9803. And they require the master to discharge that manager?—Yes; I have cases of that.

9804. Do you think that that has arisen from the influence of the union?—It was never known before the unions. I cannot say how it was managed; if there was an objectionable manager, I suppose that the men then might go to the master and make representations. But I believe, that nothing of this kind was known some years ago. I never heard of any such cases. All the cases that I have heard of have been of recent occurrence.

9805. In the case of a strike in the South Stafford or Middlesborough district, is it easy on the part of the masters to get men from other districts, or is there any impression on the part of the men in other districts that it is dangerous for them to come?—There is an impression and a strong feeling among the men generally that they had better not. It is a sort of understood rule that they do not go and take another man's job off him; but I believe there are cases which have occurred where they have been compelled to leave (by some very strong pressure being put upon them) when they have gone into a district to work, the men in that district being on strike.

9806. You spoke of a letter addressed by Mr. Kane to the Scotch workers to solicit subscriptions on the part the of the North Staffordshire union when they were on strike, have you got that letter?—I put in an extract from a letter relating to that this morning. "That a delegate meeting was held at Brierley Hill, "and a resolution was passed to the effect that the "men of North Staffordshire resist the reduction. "The council of Brierley Hill called their number of "the North Staffordshire men out on strike, and "acting in concert with our friends at Brierley Hill, "and seeing the necessity of such, we immediately "instructed the men of the Hanley district to come out "also to the number of 450."

9807. (*Earl of Lichfield.*) I rather think that I saw it stated at the time in some letter from Mr.

Williams that that letter from Mr. Kane to the iron-workers in Scotland had some influence with the masters in deciding them upon taking the step they did in locking out their men upon that occasion?—By referring to the papers it would be seen that resolutions on the subject were published. It was stated in the "Daily Post" that the men at Brierley Hill had had a delegate meeting there, and that, taking into consideration the depression of trade, they had agreed to accept the reduction, and it was understood that that reduction was to be accepted by the districts generally. It only just oozed out by the publication of this letter that it had been an understanding by the union authorities that the men of North Staffordshire were to resist the reduction.

9808. If I remember right, I saw at the time a statement of the nature I have mentioned, in a letter written by Mr. Williams. Perhaps Mr. Williams himself will be able to tell us whether that letter had not something to do with deciding the masters to take the steps they did.

(*Mr. Williams.*) That is the letter (*handing it in*).

9809. (*Mr. Mathews to the witness.*) I have not been very well acquainted with the rules of the unions in the South Staffordshire district myself, but are you aware whether there is any rule with respect to the influence of the unions upon non-union men leading union men anywhere to refuse to work with them. Have any facts of that kind come under your knowledge?—They have a rule about non-union men.

9810. What is the nature of that rule?—"That no "member of this association shall be allowed to render "any assistance to non-unionists; neither shall any "member send for or by any means procure a situation "for any such obnoxious workman. Any member "disregarding this rule will be fined 5*s.* or be dealt "with as the committee may determine." I point out in my paper with reference to that that "The "above rule brands those who do not choose to be "unionists as obnoxious workmen, whatever their "character or ability may be."

9811. So that the inference would be that in the case of a minority of non-union men working with a majority of union men in any works, the non-union man's position is made very uncomfortable?—Yes. The evidence of Messrs. Gilkes, Wilson, Pease, and Co., contained in my appendix, refers to a case of that kind. The men would not go to work unless a non-union man was removed, or became a member of the union. Then he got another job, but he found the place so uncomfortable, I suppose, from the moral pressure brought to bear upon him, that he very soon joined the union.

9812. Moral pressure is brought extensively to bear upon a non-union man to make him join the union; is that so?—Yes. I do not say that it is a part of a definite understanding on the part of the union as a body that they shall bring any pressure to bear upon non-union men, but that union men and bodies of union men do that. It seems to be recognized.

9813. (*Mr. Harrison.*) With regard to your answer to Mr. Mathews just now with respect to the proportion which the wages paid bear to the total cost of the ton, your answers are not based upon an actual calculation of the figures, I think?—No; I have not made those calculations.

9814. In the case of the letter which you read just now with respect to the interference of a secretary, do you know what class of union that secretary belonged to, was it a labourers or a puddlers union?—It was a division of one of the associated bodies, a division of one of the unions.

9815. Was it a puddlers' union?—Yes; one of the two puddlers' unions.

9816. That man was a branch secretary of one of these two puddlers' unions?—Yes.

9817. Do you say that it is the practice for union men to refuse to work with non-union men?—I have had several cases brought under my notice where that was the case.

9818. You have had several cases brought before you where objections were made, but do you mean to say that as a fact the men working in one works are all unionists, and that in another works they are all non-unionists; is it in each of the works the usual rule for them to work together side by side?—I should say that in most instances the contractors generally do belong to the union. Either the greater part of them are in the union or the greater part of them are out. If the majority of them were in I believe that they would soon bring the others in. If a large section of them were out, at any time when union matters came to be considered, I think that probably the non-union men would be strong enough to retain their position.

9819. Can you mention any works at which the men now working refuse or have refused to permit the employment of a non-union man?—Cases were brought under my notice in connexion with the works in the Tyne district, where they refused to work with, I think, two non-union men. I wrote to ask for information from the manager, and I asked him whether he would come and substantiate any of those facts before the Commission, but he wrote to me a few days ago saying that those were such small cases that he thought it would not be worth while. Those were cases where the men had positively said that they would not work unless certain men were discharged or joined the union.

9820. Can you produce the case of any single works at the present time where the men employed are exclusively unionists and where they refuse to admit non-unionists?—My impression is, that at the present time the union men are not at all so numerous as they were, because bad trade and so on has affected them very much. I do not hear of union men being so marked or the distinction being so marked between union and non-union men as it was when trade was good, and when union movements were very brisk.

9821. That means to say that you do not know of any case in which the union men insist upon exclusive employment?—Not any special case. I do not think that I have information at present about that. I should like to make some remarks with regard to the paper I handed in. In the first part I have stated that "three organizations will be referred to," and I have stated the rules of these different associations. On referring to the papers more carefully, I see that I have quoted the rules quite properly, but I do not see that the Millmen's Association of West Bromwich has been mixed up in these conferences, and therefore that part of the statement which says that "these "three organizations will be referred to, as the Gates-"head Union, the Brierly Hill Union, and the Mill-"men's Union," may be so far modified as to run thus: "In the following statement the two organi-"zations to which the evidence relates are the Gates-"head Union and the Brierly Hill Union." But as far as the Millmen's Association are concerned, the rules are correctly extracted in my paper. I have not had an opportunity of knowing much about the proceedings of the Millmen's Association. I believe, however, that it would be unjust to them to say that all that is in this paper, which has been drawn to a very considerable extent from publications of the unions, would apply equally to them; therefore, it is only fair that I should just make that explanation. With reference to another statement that I made, having received from the representatives of the union information that it was not correct, I have referred to the case more particularly, and now I wish to make a correction in my paper, as I am very anxious that nothing should be stated that is not, as far as I know, correct. I refer to a passage in connexion with the strike in the North of England, where the Consett men are said to have gone into work. The passage is this:—"About the end of September about 2,000 "men (of those employed by the Consett Company) "gave in, and accepted the reduction. They appear "also to have left the union altogether, and exhibited "great hostility towards the president of the union, "Mr. Kane, who had difficulty in escaping safely

Mr. J. Jones.
27 Nov. 1867.

"from the place." Now Mr. Kane made a representation to me that that was incorrect, and I find it is so to a very considerable extent. I may say that I took that statement from the published accounts, which were not contradicted, and I imagined that they were correct.

9822-3. (*Earl of Lichfield.*) Can you give us any information as to practice which is said to exist among some of the employers at Middlesbro', and which has been alluded to here?—Referring to the evidence given before the Commission relative to deductions made for bad rails, I communicated with the firm mentioned by a previous witness, because I thought it was a question that might arise, and the information that I have is contained in a communication which I have received from that firm. It seems that on the 5th of October 1864 this agreement was entered into:—"In order to settle the "differences respecting deductions made for the bad "rails, we hereby agree to cancel the arrears now due "from the men, and in future to pay them on "all rails which pass the saws, making a deduc-"tion of $2\frac{1}{2}$ per cent., which is to cover the "amount of bad rails found after passing the "saws, be the same actually more or less than "$2\frac{1}{2}$ per cent." It was stated, I believe, that that agreement was entered into by the men and the masters, and was kept until the strike of 1866, but that after the strike that agreement had not been enforced. The manager writes to me to say, "I am "prepared to prove by your books that ever since the "men's resuming work in January, 1867, $2\frac{1}{2}$ per "cent. has been regularly deducted week by week, "and neither more nor less than $2\frac{1}{2}$ per cent." So that he is prepared to prove that that agreement has been adhered to. It was on October 5th, 1864, that the agreement was entered into, and the men struck in 1866. And since the men have resumed work this year the firm state that they have deducted $2\frac{1}{2}$ per cent., and neither more nor less than $2\frac{1}{2}$ per cent.

(*Mr. Kane.*) My statement was this. Of course I spoke of the communication made to me, a meeting having been called there in consequence of the men receiving their pay notes, each with a fine ranging from 1*s.* up to 20*s.* Amongst other evidence that came before me on that occasion was a statement to the effect that the agreement entered into in 1864 had not been kept on the part of the company. But according to the statement received from Mr. ——— it has been kept. I therefore have no wish to press that statement of mine, but as far as the other statements are concerned I am not prepared to withdraw them, because I have the pay notes in my possession with the illegal deductions from the men.

9824. (*Chairman to Mr. Kane.*) You will not put your evidence against that of Mr. ——— if he states that the $2\frac{1}{2}$ per cent. has been abided by?—No, I shall write a note to him to-night, and state how the circumstances occurred.

The witness withdrew.

Mr. W. Williams

Mr. WALTER WILLIAMS examined.

9825. (*Chairman.*) You are honorary secretary to the South Staffordshire Iron Masters Association, are you not?—I fill that post.

9826. And a considerable proprietor of ironworks, I believe?—I am.

9827. What are the works with which you are connected?—The Wednesbury Oak ironworks, Tipton, in the county of Stafford, the Union furnaces, and sundry other collieries and places in the neighbourhood.

9828. There is a union of masters, I believe?—An association of masters.

9829. When was that established?—I imagine that it dates back for a matter of 40 or 50 years ago so far as the association is concerned.

9830. What are the purposes of it?—It was for regulating the prices of iron, looking to secure an average rate of wages agreed upon, and parliamentary business.

9831. (*Mr. Mathews.*) Have you any rules that you can put in that govern the transactions of the South Staffordshire ironmasters?—I have got the rules as passed on the 29th of March 1864, and I will put them in (*handing them in*).

9832. Were there any written rules previous to these?—None.

9833. It was simply an association for general trade purposes, governed by no particular rules?—Just so.

9834. Your position as honorary secretary of the South Staffordshire Ironmasters Association coupled with your reputation as one of the largest iron makers in the district, and as a maker of marked iron, gives you an opportunity of being well acquainted with the circumstances of the trade, the prices, the policy of the association, and other circumstances relating to the district?—Certainly.

9835. Can you speak as to the exact period for which the agreement has subsisted that the puddlers should be paid 1*s.* ton upon every 1*l.* of the price of marked iron?—I should say that that was the arrangement entered into after a strike in the year 1847 or 1848 if I remember rightly, and it was an arrangement which was entered into between Mr. Thorneycroft and his men as the means of settling the dispute at that time.

9836. Mr. Thorneycroft being one of the principal ironmasters in the district?—Yes, at that time. A considerable dissension arose between the masters and the men, the men feeling themselves aggrieved that the price of iron had run up rapidly to 12*l.* a ton, and yet that the rates for wages had not run up in the same ratio. After sundry reductions which came from falls in the price of iron, it was then considered desirable and an offer was made by Mr. Thorneycroft to his men, that from and after that date all prices should slide with the nominal rate of iron, 1*s.* per ton for the puddlers wage to represent 1*l.* per ton in the price of iron; and that agreement existed up to, I imagine, the year 1857 or 1858. I cannot tax my memory with the actual date.

9837. What took place to alter that relation between the price of puddling and the price of bar iron?—I imagine that there were less men and more work.

9838. That in consequence of an increased demand for puddlers, the puddlers established a different relation between the price of puddling and that of marked bar iron in Staffordshire?—They did.

9839. Were there any unions in the district at that time?—The present unions (if they really exist now) will be the third set of unions that I have known.

9840. That is to say, in the course of your experience you have known three different periods at which unions have been established?—I have.

9841. (*Sir D. Gooch.*) And each of them died?—each of them died.

9842. (*Mr. Mathews.*) What was the cause of their death?—Want of funds and want of objects.

9843. When the price of iron came down and the demand for puddlers was less urgent than it had previously been, the puddlers did not pay up to the funds, and the unions died?—They could not afford to pay anything for secretaries and associations, and I believe that they also died, because as an almost invariable rule their secretaries managed to walk off with their funds.

9844. That was generally the termination of the union?—Invariably, in my experience.

9845. It has been stated that the Staffordshire union took its rise in the strike of 1863?—Yes.

9846. Were unions existing then?—There had been unions.

9847. So that the effect of the unions upon puddlers' wages in relation to the price of marked iron, did not

date previously to 1863?—It had dated previously, but was not then in existence.

9848. With respect to the price of marked iron, your firm is one of the largest firms of Staffordshire, have had a reputation for making a superior sort of iron, and you in conjunction with three or four of the other large firms in Staffordshire have made iron that could not be made generally by the bulk of the ironmasters in South Staffordshire?—Certainly.

9849. Thereupon you found it politic as well for yourselves as for the public to fix a uniform price among all those members of the trade that made that particular sort of iron?—Yes.

9850. That price being more uniform and less subject to fluctuations than any other, was found to be the most convenient basis on which the rate of puddlers' wages could be established?—Yes.

9851. The price of marked iron being less fluctuating than the prices of other descriptions of iron in Staffordshire, it was found convenient to fix the price of marked iron as the basis for the general rate of wages?—It was considered the most equitable gauge as being subject to less fluctuations.

9852. And therefore less liable to affect the action of prices upon puddlers' wages?—Yes.

9853. Puddlers' wages being fixed upon the price of marked iron, and puddlers wages being the standard upon which all other wages are fixed, when puddlers wages rise it affects the wages throughout the whole mill, and when they fall it equally affects them?—I imagine it does.

9854. And generally speaking this principle has been recognized by the men on the one hand and by the masters on the other?—Yes.

9855. And until the recent resuscitation of the Puddlers' Union the relation of 1*s.* a ton upon wages upon the 1*l.* of bar iron has been for many years the understood relation on which the trade has worked?—Not quite so, because in April 1857 or 1858 there was already a 6*d.* advantage in favour of the men.

9856. Previous to the year 1857 or 1858 that relation which I have stated had always existed?—Yes.

9857. But above the year 1857 or 1858, there being an increased demand for puddlers, they established an advance of 6*d.* over the old rule?—Yes.

9858. And the second 6*d.* was established in 1863?—Yes; it now stands at 8*s.* 6*d.* as the wages for puddling, and 7*l.* 10*s.* as the price for iron.

9859 (*Earl of Lichfield.*) As I understand, the rise continues the same, only the minimum price has changed?—To make it quite clear, I should say that in August the 18th, 1863, the price of iron was 7*l.*, and wages 7*s.* 6*d.* On August the 19th, the price of iron was 7*l.* 10*s.*, and wages were 8*s.* 6*d.* It was a mild way of admitting that the masters were defeated.

9860. (*Mr. Mathews.*) That is to say, by the instrumentality of the unions the men established something like an addition of 20 per cent. all round to the previous relation that subsisted between the price of iron and the rate of wages?—That is the fact.

9861. What has been the effect of that with respect to the recent reduction in the price of iron. The price of iron having been reduced now considerably below what it formerly was, and wages remaining 1*s.* a ton higher, does not that place South Staffordshire as well as England generally in relation to foreign countries in a disadvantageous position?—As a matter of course there is exactly that amount of disadvantage to them that is advanced on the rate as compared with what it was before.

9862. And not only with relation to the foreign countries, but with relation to the different districts in England. Taking Wales, for example, they have established a 10 per cent. greater relation in South Staffordshire than in Wales?—Yes; but I should like to say in justice to the men that when the demand for puddlers increased it was not so much the fault of the men that they found three masters looking for two men as it was the fault of the masters themselves. The masters were outbidding one another for the men, and the men took the precaution (I should say wisely, as I think on their part) to seek an advance of wages, which I think the puddlers were entitled to, that is to say, so long as three masters were looking for two men to do three men's work, the men were entitled to an extra wage. And that was in reality the origin of the unions.

9863. If there are only two puddlers to do the work of three men they would get the best price they could, and that price would naturally be a higher one?—Quite so.

9864. And that without any imputation upon the unions of dealing unfairly?—Certainly up to that period.

9865. On the other hand, if there are now three puddlers seeking after two masters, you would naturally infer that the masters would say, "We cannot "afford to give you more than a certain rate of wages, "we must revert back to the old relations?"—That is the natural result.

9866. There is no tyranny in that is there?—It is the law of supply and demand.

9867. You have had some experience, I think, of foreign countries; I think there was a book published some time ago by yourself and Mr. Creed on an investigation which you made into the iron trade in Belgium and Prussia. I believe that you found there that the rate of wages were very much lower than it was in England?—I think I stated that they were from 20 to 30 per cent. lower in those countries.

9868. If the wages of ironworkers in a foreign country were 30 per cent. lower than in England, and it came to a battle for the iron trade between Great Britain and that foreign country it would be absolutely requisite, would it not, that that battle should be fought in the interest of all parties, not only in the interest of the masters but in the interest of the men, too?—Undoubtedly.

9869. The men would be compelled, in point of fact, to accept a reduction of wages without any desire on the part of the masters to act oppressively towards them?—Certainly; they are participators in the advantage or disadvantage of circumstances as they arise.

9870. I believe we have it in evidence from Mr. Jones that a very large proportion of the pig iron made in the Middlesborough district is exported to Belgium and Prussia?—There was some previously, but during the last 12 months it very much exceeded what it had been previously.

9871. And that, when manufactured, has been exported to other countries?—Yes.

9872. That is to say a reduction in the price of iron has stimulated exportation?—It has stimulated them to undersell the English.

9873. And they interfere with the large demand for iron here from Russia and other countries?—Yes, to the extent of their power of production.

9874. So that putting aside the operation of unions, whether any offensive action was charged upon the union by the masters, or any defensive action was alleged by the union on the part of the masters, the circumstances of the trade are such that the masters are compelled to reduce the men's wages in order to fight the battle in some degree with other districts in this country, or with foreign countries, where cheaper labour is employed?—Decidedly. I maintain that the interest of the masters and the men are identical in the advance or reduction of iron. No master will reduce the price of iron if he can help it or reduce wages if he can help it.

9875. The operation of reducing wages is a very unpalatable one to an ironmaster?—It is an unprofitable as well as an unpalatable one.

9876. That is to say that generally the fall in iron is more than commensurate with the fall in the rate of wages?—Yes.

9877. If iron falls 20 per cent., a master cannot recoup himself by any reduction in wages?—No.

9878. The interest of the master therefore is to guard himself as much as possible against any reduction

Mr. W. Williams.

27 Nov. 1867.

in iron and in wages, and to avail himself as much as possible of a rise in the price of iron and wages?—Decidedly.

9879. But the action of these unions tends I suppose to a certain extent to interfere with that process?—It has done so.

9880. By some artificial contrivance the unions have in some degree prevented, or aimed to prevent, the natural result?—Yes. I look upon it that there was an unnatural demand for the labour of iron-workers, and that demand was so stimulated that they were enabled to get an increased rate of wage. That position of things as long as it continued was all in their favour.

9881. (*Mr. Harrison.*) You say "an unnatural demand," what do you mean by that expression?—I mean that there were more employers than there were men. There were only 1,000 puddlers and there were 1,100 or 1,300 puddling furnances.

9882. You mean an increased demand?—Yes, I meant to say an increased demand.

9883. (*Mr. Mathews.*) That being the case I suppose the operation would always be some reasonable expectation on the part of the men under the circumstances of an increased demand for their labour, and they look for a certain advantage from it?—Yes.

9884. On the other hand if there is a fall in the price of iron there is the absolute and inevitable result of a reduction of wages?—Either reduction of wages must follow or ruin for the master.

9885. Do you think that any contrivance either in the way of unions or anything can materially influence that inevitable result which you have been describing?—I do not think that it has been invented yet.

9886. No operations of unions will prevent a reduction of wages in bad times, and no contrivance of masters will prevent a rise of wages in good times?—I think not.

9887. It is a social necessity that those results must follow?—An actual necessity.

9888. From what you see on the continent, do you think that any contrivances on the part of the masters here to prevent a reduction in wages or any contrivance on the part of the men to keep up the price of wages after a reduction has taken place, would have the slightest effect in the long run?—I think not the slightest. If it were continued it would naturally have a detrimental influence upon the iron trade in this kingdom as against the iron trade in other kingdoms; because if we maintain a high rate of wages while they maintain a low rate of wages there is a margin of profit left for them on the continent in which we cannot possibly participate.

9889. I think that Mr. Harrison as well as myself will be glad to have from you a little practical information on a point which seems to have somewhat puzzled him, namely, as to the actual cost of labour on a ton of bar iron. I will take your establishment as an example. You have your own mineral properties, you raise your own coals, you raise your own iron ore, you make your own pig iron in the blast furnaces, and you make that pig iron into bar iron. Now, taking the price of your marked bar iron at 7*l.* 10*s.*, can you tell us how much of that in the rough is comprised of wages, and how much of fixed charges like royalties, (under leases, or under some arrangement) which you could not move either one way or the other?—At the present moment I should say that labour was nearly 90 per cent. on the whole.

9890. If that be the case and a fall occurs of 20*s.* a ton upon bar iron, then in your works, where perhaps you produce 700 tons of manufactured iron a week, that fall in the price of bar iron might involve to you a difference of 700*l.* a week?—The fact of a reduction of wages goes a great way towards a reduction in the price, though it does not go the whole way.

9891. But seeing that the 1*l.* a ton would make a difference of 700*l.* a week to you, it would be absolutely necessary for you to reduce wages in some degree proportionate to that?—Yes, but we must draw back to the fact that at the present moment we are only doing half work.

9892. Whatever the extent of work may be, it is in that proportion that the fall in the price of iron would affect you?—Yes, in our capacity in relation to manufactured iron. It is not 700 tons a week, it is not 300 tons a week; indeed our actual make is now little more than 100 tons a week.

9893. You do not make more than that in the whole of your two forges?—No.

9894. A reduction of the wages is not so much a matter of choice on your part as an absolute and inevitable necessity?—An absolute necessity.

9895. However unpalatable it may be to you, and however unpalatable it may be to your men, the necessity exists and you are obliged to bow to it?—Yes.

9896. What is the effect that the unions have had in respect to the relations between yourself and your workmen in endeavouring to settle these questions without the necessity of a strike?—For a time during the height of the union action it was certainly a most unpleasant period; but I am happy to say that I think all that feeling has died away.

9897. Has it died away from the want of influence of the unions do you think, or from any other cause?—I do not think that there is any union now, at any rate that I am personally connected with. I personally have nothing against the unions, because when I have had to do with them they have acted straightforwardly, honestly, and as far as I could judge truthfully. But that the effect of unions upon the kingdom and the trade of the kingdom has been disastrous I certainly believe.

9898. (*Chairman.*) Do you speak of unions generally or unions in the iron manufacture?—Of unions generally.

9899. I understand you to say that as far as the iron trade has been concerned you can speak with considerable respect both for the judgment and for the feeling of the unions which you have had personal intercourse with?—Yes.

9900. (*Mr. Mathews.*) Personally you have never come into any hostile collision either with the unions themselves or with their officers?—No. I have never come into hostile collision with them or with their officers, but I must tell you that as far as I am personally concerned I have entirely ignored unions. They are as much at liberty to have unions on the part of the men as we, among the masters, but if any men inform me that they are under the rules of the union, I inform them that they must look to the union to protect them, that we admit no union rules to interfere with us.

9901. That is to say, you give your men to understand that they are at perfect liberty to enter into any union they please, but that if their rules conflict with the regulations of your works, and thereby one of the two must give way, you do not intend to give way?—Yes.

9902. The inevitable inference is that if there is any giving way it must be on the part of the union and not on your part?—Yes.

9903. Standing upon that doctrine and knowing your position in the iron trade in South Staffordshire, you have never come into any objectionable contact with the unions?—Never.

9904. They have not given you any personal annoyance?—No.

9905. Are you at all aware what proportion of the men in your employ are in union and what are out?—I do not think that there is a single union man in our employ at the present moment.

9906. Do you imagine that your works are less advantageously and less amicably conducted than they would be if you had a great many union men?—I do not consider that it makes any difference to us; we go on one way as well as the other.

9907. Supposing these unions to be objectionable, looking at the weekly contribution which the men have to pay for the expenses, the liability to levies and various other things out of their weekly earnings, do

you admit that the men are better off under the influence of the unions than they would be if left to settle matters with their employers without unions?—Under existing circumstances I think that they would be quite as well off without them. Unions have been beneficial, but their general influence is to handicap men; the worst workman they say are entitled to as high wages as the best workmen. They consider that a bad workman should receive, if he does the work that a good man would do, the same wage. We do not agree to that, and I maintain that that is the one disastrous operation connected with unionism.

9908. If this handicapping system were generally adopted throughout the South Staffordshire district, or any other district, what would be the result as to a really beneficial effect or otherwise upon the ironworks?—I consider that it would be disastrous.

9909. It would place the ironworks where such a system existed at considerable disadvantage in comparison with the ironworks where no such system existed?—Yes. During the time that the union was in active operation, we were paying men who certainly were worth less by 10*s.* a week the same as we were paying to better men who would have had the extra 10*s.* but for the fact that unionism prevented our picking them out.

9910. (*Mr. Harrison.*) Were they not paid by the ton?—Yes.

9911. Then I cannot understand what you have just said?—One puddler is able to do his work so much better than another that he may save in yield and in the quality of his workmanship so much in favour of his master that he can afford to pay him a higher price. Another man will work to a bad yield, and you will lose the difference. For instance, we will take it that the ordinary rule is that the yield of a ton of good iron for 20 cwt. would be 18½ cwt. of puddled of iron. Now a bad puddler would only bring out 17¼ or 17½ cwt., so that we should not only have the loss of the pig iron, but the loss of the coal and the labour on that quantity.

9912. Is it not the case that the amount of the pig iron supplied to the puddler is a fixed quantity, and that he is bound out of that to produce a certain quantity of puddled iron?—I am not aware of that.

9913. (*Mr. Mathews.*) If a fixed quantity is given to the puddler, he is bound to produce as much as his abilities will enable him to do?—Yes.

9913*a*. And if it is found that he does not produce a certain average quantity, he is put down as a bad workman?—Yes.

9914. Is it the practice among these bad workmen to steal "puff," and to do certain other things that have been alluded to?—Yes.

9915. What means has the master of preventing that?—Punishing him by fine if he can, or sending him to gaol.

9916. Therefore it is perfectly consistent on the part of the Ironworkers Union to establish a rule discouraging this sort of predatory operation?—Yes.

9917. And the ironmasters as well as the officers of the union would be perfectly willing to encourage any scheme to prevent such a practice going on?—Delighted.

9918. In the event of its being discovered, the master fines the puddler or discharges him?—Yes.

9919. If he fines him, and if the puddler objects to pay the fine (which he can do by law), he is dismissed?—Yes.

9920. The masters do not go to the union to enforce the fine?—I believe that some masters have done it.

9921. That is to say, some masters have co-operated with the officers of the union in endeavouring to put a stop to that practice?—Yes, I believe that at one time the union had a good effect in preventing that pilfering going on.

9922. So that one of the advantages of the union is that it has really been beneficially operative in preventing this disreputable practice on the part of the bad puddlers of stealing iron to make up their yield?—It has for a time.

9923. That sort of thing has existed for years I suppose, and the masters have always discouraged the practice?—Yes, certainly.

9924. (*Mr. Harrison.*) It is not the practice to allow each separate puddler a different quantity of pig iron to work up, is it, but each man has his fixed amount?—There are distinctions of what are called five and six heat turns; those heats vary in different districts and for different qualities of iron.

9925. I mean in the same works, taking precisely the same work and the same kind of iron A, B, and C, would each have the same measured quantity of pig iron given them to puddle?—Yes.

9926. And each of those men is expected in the turn to produce the same amount, is not he?—Yes, he is expected to do so.

9927. He cannot make the difference up, except by stealing more pig iron, more puff, can he?—No, but each man does not bring out the same quantity from it; the expectation is very natural, but the fact never arrives. A good workman will bring out a great deal more in the course of the week out of the same given quantity than a bad workman. A neglectful workman will always waste his iron, and therefore the neglectful workman, although working at the same rate per ton, receives less money actually on the Saturday night, and is worth very much less per ton on the ton of iron when finished, because he has not brought out the same quality. If he brings out an inferior quality it is worth less to his master than the good workman's iron.

9928. That is a matter of quality not of quantity?—It is a matter of money, it comes to the same thing. One man may bring out more of very bad iron than another man would bring out of really good iron.

9929. (*Mr. Mathews.*) That is to say there is a degree of excellence in the capacity of the puddler which enables a good workman to bring out as great a quantity of good iron as another man would bring out of bad iron?—Yes.

9930. (*Mr. Harrison.*) At your own work are the men paid different rates per ton on precisely the same class of iron?—No, the same.

9931. There is no union to produce that uniformity, but you do that without a union?—Yes.

9932. How do you show then that it is the union which has produced the uniformity, which in the absence of any union you yourself do not attempt to prevent?—I say that the action was that.

9933. The action no longer subsisting, and you not having any union men now, you still (for other reasons we may suppose) maintain a uniformity.

9934. I do not know if you have heard Mr. Hewitt's evidence that the uniformity in the rates of payment was even greater at the works at Creusot than it is in England. I should like to know whether that would accord with your experience. He told us that there was still greater variation in the rate of payment according to the skill of the workman in England than there was in France where there is no union?—I do not understand you. Do you mean that taking work of the same quality and material to be executed by men in this country as by men there, the uniformity would be greater on the part of the Frenchmen than on the part of the Englishmen?

9935. His evidence is to the effect that men are paid in England with variations in proportion to their individual skill more completely than they are in France?—That I imagine.

9936. Then if in your own case and also in the case of Creusot where there is no union, there is an uniformity in the rate of payment, how do you show that the uniformity which you complain of as being very detrimental to the trade, is caused by the operation of unions, because there you have two great instances in which in the total absence of unions the same uniformity obtains?—It would arise in this way. There are various descriptions of iron worked in England, and they vary much more than they do abroad. For instance, grey iron is paid for at a different price from common iron. In some instances the men are paid

Mr. W. Williams.

27 Nov. 1867.

for working 20 cwt. of iron the same as we should pay them for 24 cwt. If they are making wide iron they are paid allowances; if they are working double iron they are paid allowances, and so on.

9937. In this series of letters published by yourself and Mr. Creed which I have been reading, there is given in the appendix a useful tabular statement from the Avonside Engine Company Limited, of the rates of wages paid there. That I suppose, you can give as an average specimen of the rate of wages paid in England?—I think that Mr. Slaughter's letter, to which you are now referring explains what his object is.

9938. There are a few things about that which I will direct your attention to. These are the rates of wages paid to upwards of 900 men and boys in those particular works, and I have been at the pains to count them up, and I have ascertained that there are 262 different classes under which the wages are arranged?—Yes, I daresay that is so.

9939. For instance take it in this way. Among the smiths there are 49 smiths employed, and they are paid at 13 different classes of rates. There are eight men paid at 36*s.*; six men at 35*s.*; seven men at 34*s.*; four men at 32*s.*; five men at 30*s.*; three men at 29*s.*; three men at 28*s.*; three men at 26*s.*; two men at 25*s.*; three men at 24*s.*; two men at 22*s.*; one man at 12*s.*, and three men at 10*s.* Now it would hardly be possible to carry the proportionate payment of wages to a greater extent?—To save you time I may say I am not prepared to go into that paper of Mr. Slaughters' at all. It is there on its own merits.

9940. But you print that at the end of your volume as a very good specimen of the rates in England, and I presume that it is a fair specimen. I will take another case, that of the machine fitters employed by the same company. There are 68 men employed in the machine fitting shops, and they are paid at 16 different scales, beginning at 36*s.* and going down to 4*s.* In the erecting shops there are 18 different scales for 56 men, beginning at 35*s.* and going down to 5*s.* And throughout the whole of the works for 900 and odd men and boys there are 262 classes of wages. Now something of the same kind, I suppose, I mean some analogous system of payment, holds good in similar works, and in ironworks generally throughout the country?—Yes.

9941. So that the classification of the earnings of each man according to his skill is carried to a very high point indeed in England in the iron trade?—Naturally.

9942. So that in dealing with the question of the effect of unionism upon the iron trade in England, we must altogether discard from our consideration its alleged tendency to produce an uniform rate of earnings per man, without reference to skill?—Uniformily of the class of labour and uniformity of men carrying on that class of labour will apply equally. For instance, puddlers are puddlers everywhere, and whether or not they may be doing exactly the same work at one work as at another, the uniformity would be the same. For instance, I will say that we have 100 men who are puddling; 60 of those shall be good men and 40 of them shall be bad; the 40 men would have the same rate per ton as the 60 good men if they were doing similar work.

9943. You think then that it is possible to carry the classification further than the 262 classes out of the 900 men?—I do not go into that paper of Mr. Slaughter's at all.

9944. You print it in your book as evidence?—And there it is on its own merits.

9945. (*Sir D. Gooch.*) I understand you that comparing a bad workman with a good workman, supposing that there was not this uniformity, you could afford to pay the higher class workman 10*s.* per week more than you do because he produces more valuable results?—Yes.

9946. And therefore the system of handicapping, whether you are paying per day or per ton, does not work well for the man or for the master?—Certainly not.

9947. (*Mr. Harrison.*) But you do handicap them in your works; you do not pay according to this selection?—We handicap them by making a selection and getting rid of those that are bad.

9948. Then it is quite possible to pay men at an uniform rate per ton in the operation of piece-work, and not to be at all hampered in putting the proper workmen to the proper work?—Quite so, when there are sufficient men to do it.

9949. (*Mr. Mathews.*) Would it not be impossible to carry on the operation of puddling without handicapping in that way?—Quite. Years ago men had a premium upon the amount of iron produced. I believe the modern term is co-operation. If they produced a certain quantity and certain results, they were allowed to co-operate in certain benefits, and that was done.

9950. (*Mr. Harrison.*) If it is impossible not to handicap men in this way as you say, why do you charge unionism with handicapping them, and producing an uniformity which as a fact does not appear in the iron trade?—Times are changed as compared with the time when the effect of the union was so strong upon the iron trade. The effect of the union is not so strong as it was simply because there are three men looking for two men's work, and many of those discrepancies which then arose are wiped off again.

9951. (*Mr. Mathews.*) If these puddlers were not controlled by machinery which obliges them to co-operate, and if you could take them separately, each puddler on his own account without any co-operation with other men, would you think it advisable to handicap them, or would you let each puddler get what he could?—Yes, we would let each puddler get what he could.

9952. But this system of handicapping is one incidental to the particular process?—Yes.

9953. (*Mr. Harrison.*) It is not in consequence of the operation of unionism?—Not entirely.

9954. Is it at all?—We get back again to the time when the union was in strong force, which we all admit it is not now.

9955. You told us just now, and we have heard it before, that many years ago, say 20 years ago, the sliding scale was established in Staffordshire by which the wages of the puddlers were regulated in accordance with the price of the bar, and that that has been maintained, with the exception of a certain break which occurred in 1863. Do you consider that that is a desirable system, that the wages of a puddler should be regulated by the price at which the bar is selling?—Yes, I think it is desirable.

9956. That is quite contrary to the rule of allowing wages to be fixed by supply and demand, is it not?—No.

9957. It does not take into consideration the supply of the labour of the puddlers, or even the demand for their labour?—Yes it does, in this way, that if the price of iron advances so does the price of wages, and then the price of wages advancing is an inducement for fresh labour to take to that particular trade.

9958. But supposing that from certain circumstances there is a very great fall in the demand for iron, and that the price falls to meet it, and at the same time there is a great fall in the supply of the men's labour?—You mean, I presume, to say that if the demand for iron decreased and the demand for men increased (by emigration or their taking to some other trade) this system of regulating the price of wages by the price of iron should not exist. If I understand you right, I think that that answers itself. It is the law of supply and demand.

9959. But it cannot take into consideration the number of men who are in the market, can it?—Decidedly.

9960. How can it?—If three men want two men's jobs, if those two are to retain them they must take less money.

9961. (*Sir D. Gooch.*) But I suppose it operates in

the other way also. A low price of iron means a small make, and a high price of iron means a large make?—Yes.

9962. (*Mr. Harrison.*) Did you not hear Mr. Jones tell us the contrary just now, namely, that there were small contracts made at large prices and large contracts made at low prices?—That is to say that a beneficial state of trade does not last very long.

9963. But the fluctuation of wages in accordance with the price of the manufactured article necessarily leaves out of consideration the number of men at that moment in the market, the price of provisions, and a variety of other things by which wages are frequently supposed to be regulated?—I do not quite catch your meaning. I understand you to say that the supply of labour on the market has nothing to do with the price of iron, and that the price of food enters into any question of the rate of wages which men should be paid.

9964. I am not laying down any statement in political economy. I only say that regulating the wages by the price of the manufactured article necessarily leaves out of consideration the number of men at that moment in the market?—As a matter of course the state of demand regulates everything. We do not inquire whether there are many men or few men. If we have to sell our iron at a reduced rate we must reduce the cost of production, and as a matter of course as labour enters so heavily into the cost of production, that reduction in some measure falls upon every grade of labour.

9965. You said just now that the wages paid would be something like 90 per cent. upon the total cost of the manufactured bar?—Yes.

9966. In that 90 per cent. do you include the wages of the foremen, the overseers, and the clerks?—Everything.

9967. But the wages of the clerks in your establishment would not vary according to the wages of the puddlers, would they?—Not entirely.

9968. (*Chairman.*) Is the 1*l.* that does not go in wages the masters' profit?—No, it would be for bad debts and for various other circumstances over which we have no actual control. For instance, we may have a colliery, and then we have to pay the pumping and all those things. There is probably 10 per cent. difference between the amount positively paid out for labour and the amount we can receive, profits included, and all those points.

9969. (*Mr. Harrison.*) But would the 10 per cent. include as well as profits the cost of management and overseeing?—No, the 10 per cent. includes no management.

9970. (*Earl of Lichfield.*) Does the 10 per cent. include interest upon the capital and upon the whole expense of maintaining a large works?—Yes.

9971. (*Mr. Harrison.*) The 10 per cent. includes the plant and the wear and tear—all those fixed matters come into the 10 per cent. in your calculation?—The fixed matters would be interest of capital alone.

9972–3. Take the case of your own firm reducing the price of the bar 1*l.* What proportion of that 90 per cent. which is paid in wages is governed by the reduction of the puddlers' wages?—I really cannot tell you off-hand; I cannot tell you to 1 or even to 5 per cent. We will say, for instance, taking 6*l.* 10*s.* as the selling price, and taking for argument's sake 5*l.* 10*s.* to represent the labour on a ton of iron, that a reduction of 10 per cent. takes place, 5*l.* 10*s.* would be 110*s.*, and it would be about 10*s.* off on labour.

9974. If the price of a bar of iron falls 1*l.*, it is necessary at once to reduce the wages of the workmen whom I employ at the manufactory 10 per cent. That is the argument, I think?—Yes.

9975. The reason stated for that being that a very large proportion of the amount expended in manufacturing that bar of iron represents the wages of those men. Now, I ask what proportion?—I have heard today that 5*l.* 10*s.* is taken as the amount spent on labour. If you reduce 10 per cent. on 110*s.*, you take off 11*s.*

9976. Then you have said that 90 per cent. of this is expended in wages, or in payment of men's services; but a portion of those are not that class of men whose wages are reduced according to the puddlers, and I want to know, excluding that portion, what you reduce the 90 per cent. down to?—Really, I have not taken those matters into my consideration. I did not know that that was the object of this inquiry.

9977. The argument to show the necessity of reducing the wages of the men employed, in accordance with the selling price of the ton, entirely rests upon that calculation being made out, does it not?—Upon my word I do not know; I cannot go into that. If you assume the figure of 90 per cent. as the amount of wages paid, and you reduce the selling price 10 per cent., it is evident that you will be producing your article for nothing, unless you reduced wages also. If you reduce the price by taking off 10 per cent., and you sell the article at 90 per cent. of the former cost, without reducing wages at the same time, then it represents the positive fact that you are working at a loss.

9978. But the reduction does not go upon the whole 90 per cent., you told us?—It does pretty nearly.

9979. The calculation requires that everything should be discarded out of that sum except the wages of those workmen whose wages are governed by the puddlers?—I have no means of calculating these things in my head.

9980. (*Mr. Mathews.*) Is it not a self-evident proposition that, given that the royalties and the other fixed charges are so much upon the ton of iron, all the rest must be labour?—Yes.

9981. And will not that vary from 80 to 90 per cent.?—Yes.

9982. It may be 80, 85, or 90 per cent., but betwixt 80 and 100 the fixed charges constitute a certain proportion, and all the rest is labour?—Yes.

9983. And no ironmaster could give the actual amount?—No. To reduce it to plain English it means this: at the present time we are making iron at a nominal price; we are not making salt, and if we did not reduce wages, it would be a dead loss to us of 1*l.* a ton.

9984. (*Earl of Lichfield.*) What proportion of the 90 per cent. which you say is paid in wages is not affected by a rise or fall in the puddlers' wages, the puddlers' wages ruling the others; that, I think, is what Mr. Harrison asks for?—Mr. Harrison wants to get what I am not able to give him.

9985. Cannot you tell us about what proportion of the wages which you include in that 90 per cent. are not affected by a rise or fall in the rate of wages paid to the men who actually manufacture the iron?—No.

9986. Could you tell us in rough figures, as to your own establishment, about what would be the cost of your permanent staff of paid managers and persons whose wages would not vary with the price of iron?—I should have to answer that question by asking another. Supposing that we make 300 tons of iron per week and divide the dead charges over that 300 tons (and we will say, for the sake of argument, that it is 5*s.* a ton, that being 10 per cent. on the whole), if the state of trade reduces our make from 300 tons a week down to 100 tons a week, what ratio of dead charge will it be upon the 100 tons as against the 300 tons? That is the answer that Mr. Harrison wants, and I cannot give it.

9987. (*Mr. Harrison.*) Then in point of fact it would be impossible to say what proportion of the total cost of manufacturing the bar represents precisely the wages of those men whose wages are regulated by the puddlers' wages?—It would.

9988. (*Mr. Mathews.*) Is it not the fact that when a notice is given in a works like yours for a 10 per cent. reduction it extends to all classes of labour?—Yes.

9989. And if there is any departure from that practice it is because the special cases are brought before you and you do not think right to reduce them so much as 10 per cent., but then you would reduce the others more?—Yes; but if the price of the bar is

Mr. W. Williams.

27 Nov. 1867.

reduced 10 per cent., then 10 per cent. is the figure, and we should not take more than 10 per cent., if we had agreed to that.

9990. If you did it by special bargain with the men you mean?—Yes, I should. We will take it for instance that 5*s.* shall be the common charge—that, on a make of 300 tons, will be 10 per cent.—but if you put the common charges on 100 tons instead of 300, it makes it 30 per cent. And, therefore, for you to do a small quantity of work is simply ruin; you must carry on your works, and you must reduce your cost in order to be able to carry on your works when a depression takes place.

9991. Is it not the case that you must have the conditions of any two works exactly the same for any calculation to be made?—Yes.

9992. And is it not impossible to have the circumstances of any two works exactly the same?—It is impossible.

9993. Do not you think that any other ironmaster might differ in opinion from you as to the exact percentage, his works differing from yours?—Yes.

9994. (*Sir D. Gooch.*) Supposing your works are in full employment with 300 tons, out of the 90 per cent. would there be as much as 10 per cent. for clerks and fixed charges?—I should say that about 10 per cent. would represent it.

9995. (*Mr. Harrison.*) But that does not rest on any actual calculations which you have made?—No.

9996. You would not, I suppose, go so far as to say in accordance with some who have spoken or written about this matter, that in the iron trade within the last five years, the unions have systematically forced up the current rate of wages, but rather that they have been engaged in resisting a gradual fall?—Well, I cannot say that. The effect of the unions was to support the advance, and if I may use the word, it was a high pressure on the advance that was being made by the aid of the unions. I do not find fault with the action of the unions. Seeing that labour was scarce, they had a perfect right to get what they could for their labour—they have as much right to get for their labour a higher price, because it is scarce, as we have to get for iron a higher price because iron is scarce.

9997. Speaking generally, do you attribute in any appreciable degree the injury to the iron trade which is supposed to have resulted from foreign competition, to the pressure of the unions for a higher rate of wages?—I do certainly. I consider that the effect of unionism has been to maintain a higher average rate of wages than would have been maintained had the iron trade taken its natural course, that is to say, had they gone into competition with foreign countries to win those orders which foreign countries have won.

9998. Do you think that the wages of the iron-workers would have been lower than they are but for the unions?—I certainly think they would.

9999. They have now fallen 30 per cent. within three years, have they not?—I am not aware of that.

10,000. What were they in 1863?—They have been reduced 20 per cent. since 1863.

10,001. What are puddlers' wages now?—8*s.* 6*d.*

10,002. (*Mr. Mathews.*) There have been two reductions since 1863?—There have been two reductions in Staffordshire.

(*Mr. Kane.*) And three reductions in the North.

10,003. (*Earl of Lichfield to the witness.*) Is the rate of wages lower in North than it is in South Staffordshire now?—I really am unable to say.

10,004. (*Mr. Harrison.*) It comes to this, does it not, that the prejudicial action of the unions has been their unsuccessful attempt to withstand a reduction of wages which has varied from 20 to 30 per cent. within the last four years?—I do not see if it is unsuccessful how it could be prejudicial. If you mean that the reduction in the price of iron has not taken place in the way it would have taken place had it not been for the rate of wages, I think that it has been prejudicial to the iron to the iron trade.

10,005. (*Earl of Lichfield.*) Do you think that there would be a better trade and more employment at this moment if it had not been for the action of the unions. Do I rightly understand that to be your opinion?—I think that the North of England would have been better able to compete with France and Belgium than it has been if the price of iron had been lower and the rates of wages lower to meet it.

10,006. And therefore there would have been more iron trade at this moment in the country?—To some extent.

10,007. (*Mr. Booth.*) That the wages would have been lower, but that the employment would have been more extensive?—It would have been in some cases greater. I think it only fair to say that the present most exceptional times are not at all a fit criterion of what the iron trade is. I do not think that we can speak of the depression in the iron trade at the present moment as being effected by unionism alone when so many other things have contributed to make it bad. It must not be understood that the whole blame is laid to unionism.

10,008. (*Chairman.*) Can you state the leading causes of depression?—The commercial panic for one thing has been universal in its effects. Then there has been the railway depression, and the shipbuilding depression.

10,009. What has stopped shipbuilding?—The disturbed state of the money market.

10,010. (*Earl of Lichfield.*) That is only a question of degree. As I understand you, you give it as your opinion that whatever the degree of those other influences may be there would be more employment at this moment in the iron trade if it had not been for the competition that has previously been encouraged on the part of manufacturers abroad?—Yes, that is my impression.

10,011. (*Mr. Harrison.*) In your very interesting letters upon the iron trade written during your visit to Belgium I see that you contrast favourably the position of the Belgium iron trade with respect to the state of the law and the regulation of the Government with the position to which the trade is exposed in this country. What are the particular points upon as to which you think that the Belgium iron trade is under more favourable legislation whether through government intervention, or through the absence of government interference, than it is in the country?—I think that that alluded to a question beside this Commission. I do not think that it was at all intended to allude to anything that this Commission is connected with.

10,012. We are sitting here to see what alterations in the law may be desirable with respect to combinations, and the interests of workmen and employers in association generally. Now, no doubt the laws in England may be very usefully contrasted with those in Belgium, and I ask what is that species of legislation which is best for the trade for all persons concerned?—I must observe that that is a wide question, and that I entered further on political economy in that book than I can possibly do here. I made remarks there that have no possible interest for this Commission, as for instance, in the case you speak of now; If you put it in this way, "Have the laws, as "existing between master and workman any distinct "operation there different from what they have here, "then I shall be able to answer you."

10,013. Then I will put it in that way?—I am not aware that there is any difference, but unions were not in existence there to the same extent that they are here.

10,014. (*Earl of Lichfield.*) Did you compare the position of the Belgian workmen with the position of the workmen in the country?—Yes.

10,015. What was the result?—I considered that the workmen there were as well off, or better off than the workmen in this country. I went on to say, to follow out the argument, that they were free to take

their labour where they liked, at what rates they liked, and to whom they liked; that they were regulated by no laws amongst themselves; that they were not prevented from working at high rates or low rates; and not prevented from working six days or five days a week. In fact, as to the last point, they work sometimes on Saturdays and Sundays, and every day except high days and holidays, according to the demand. Whilst they received a lower wage per ton than the men here, I stated that they were in receipt of a general average of wages satisfactory to them, and that the Government does not interfere with them either by inspection or by any interference whatever.

10,016. (*Chairman.*) Cannot a workman take his labour to any part of our kingdom he chooses?—He could not sometime previous to this when there was a rule of the union that union men could not work with non-union men.

10,017. That would not be the law of the land?—Certainly not. I did not allude to the law of the land.

10,018. (*Mr. Harrison.*) You found in several of the works abroad a great deal of women's labour current, and I think you even found them working underground in coal mines, did you not?—Yes.

10,019. Did you find that that as a system was spoken of in the country as very unsatisfactory or injurious?—No, it was not spoken of as a system as being injurious. In certain districts it is not approved of, but in other districts they are very willing to let it exist. I think you will find in that pamphlet a passage saying that for a certain distance round the Liège district they did not allow the services of women to be employed underground, but that round the Mons district and the Charleroi district they did allow them to be employed.

10,020. (*Chairman.*) I suppose that it depends in great measure upon the physical capacity of the women whether it is an evil or not?—I think so. I am not a defender of women's labour, but I must say that where I see women labouring, they are generally a stout healthy lot of women.

10,021. (*Sir D. Gooch.*) Do you employ women in Staffordshire?—Yes, there are some employed, and they are stout able women; there are a great many of them that I should not like to have a passage of arms with.

10,022. (*Earl of Lichfield.*) What is the difference between the rates of wages in Belgium and in England in the same departments of labour?—I think it varies from 20 to 30 per cent.

10,023. Are you able in any way to account for that difference in the rate of wages between Belgium and this country?—In the first place, they live in Belgium in a much more meagre way than our people do, and they work more continuously. Then, too, they have not the same habits of spending money in public houses and elsewhere.

10,024. Did you perceive that they had any advantage in Belgium over the advantages possessed by the workmen in this country, which enabled them to live upon a lower rate of wages?—I say in that pamphlet that they worked six and seven days a week where our men work four or five. When the trade with us is good, men will only work four or five days, so that we never put the utmost ability and strength we can find into the producing power of our establishments, whereas in Belgium they continue working through the other days of the week. Their fixed charges are less. Taking repairs, for instance, if a furnace is lighted for three weeks, and never put out, there are no repairs, but with us that is a matter of weekly occurrence, because they must be repaired after being once let out.

10,025. (*Mr. Harrison.*) Did you ascertain to what extent the practice of workpeople owning bits of land was carried in Belgium?—No. In some districts the men had their cot and their piece of land or garden, and that they have with us.

10,026. (*Chairman.*) Do they rent them in Belgium, or are they freeholders, and have they them in perpetuity?—They have them in perpetuity.

10,027. (*Mr. Mathews.*) How did they acquire them?—The land is very cheap, and the houses and pieces of land are sold by the different proprietors. The laws there making land cheap, it changes hands frequently.

10,028. Is land cheaper in Belgium than in England?—No.

10,029. (*Earl of Lichfield.*) Can you draw any comparison for us between the price of land in Belgium and its price in this country?—No; but the difference is just this, that on the one hand I could not afford to sell any land near the works on any consideration, because of the mines; whereas in the sale of land to the men in Belgium they let them have their houses at what appear low rents. Suppose that the land is worth 100*l.* an acre, they take 100*l.* an acre for it, and that is a very small sum to the puddlers when you consider the small number of square yards attached to his house.

10,030. (*Mr. Mathews.*) Is not the price of land in Belgium affected by proximity to the works, as with us?—Not in exactly the same way as with us, because it is the interest of the masters there to collect round them a population, and in many instances they give it as a sort of bonus to the men that they shall possess the fee simple, and so become the residents.

10,031. At all events there is no greater facility in obtaining land in Belgium than in South Staffordshire?—Certainly not, except that where there are no mining rights they can afford to sell the land cheaper.

10,032. (*Mr. Harrison.*) You mean that there is no difference beyond the immense difference in the laws relating to property?—Yes.

10,033. (*Chairman.*) Supposing that you sell a quantity of surplus land and work the mines under, you do not want more than a couple of acres for 100 acres, do you, to put the refuse upon?—We do in Staffordshire.

10,034. How much?—I think that out of, say 100 acres, we pay for damaged land to the extent of about 30.

10,035. (*Mr. Mathews.*) With regard to the intimidation of the men, in the case of strike, when the men in one district are all out, do the unions exercise any intimidation upon men from any other districts who come in to take their duties. I am not particularly speaking of puddlers, but of puddlers, colliers, or other ironworkers. Is there any fear of violence deterring men from coming to take their duties?—There has been undoubtedly.

10,036. Generally speaking, would that result from the case by the organization of the unions?—It has been so undoubtedly.

10,037. And would be so now I suppose if there was a strike?—If the unions existed in strength probably it would be so.

10,038. If there was not so it would be owing to the attenuated condition of the strength of the unions?—Yes.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

1, Park Prospect, Westminster, Thursday, 28th November 1867.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.
The Right Hon. the EARL of LICHFIELD.
Sir DANIEL GOOCH, Bart., M.P.
HERMAN MERIVALE, Esq., C.B.
JAMES BOOTH, Esq., C.B.
JOHN ARTHUR ROEBUCK, Esq., M.P.
THOMAS HUGHES, Esq., M.P.
FREDERIC HARRISON, Esq.
WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. G. T. Clark. 28 Nov. 1867.

Mr. GEORGE THOMAS CLARK examined.

10,039. (*Chairman.*) Are you connected with the Dowlais Ironworks?—I am the trustee of the Dowlais works.

10,040. It is a private property, not a company?—It is a strictly private property. I am a trustee under the will of the late Sir John Guest.

10,041. How many men are there in the employ of the Dowlais works? How many are paid on the pay night?—There are between 8,000 and 9,000 persons in our employment.

10,042. Does that include men to raise coal and iron ore, and canal men, and men in the furnace works?—That includes all the persons who are employed by the Dowlais Iron Company at Dowlais for all purposes.

10,043. Have they mines of iron or of coal on their works?—They have mines of iron and coal, and works for the production of iron.

10,044. And a canal?—No.

10,045. Have you considered at all the proportion between the price of bar iron at Dowlais, and the price of the brand bar iron of South Staffordshire?—No, I have not considered that, for the simple reason that I am utterly unacquainted with the South Staffordshire manufacture, therefore I have not the means of making a comparison.

10,046. Is there any meeting among the proprietors of the South Wales works from time to time for fixing the current rate of prices for bar iron?—No, there is no meeting of that sort. Perhaps you will allow me in answer to the question, to state that there is or was what is called a South Wales Iron Masters Society. I have been the chairman of that society for about 10 or 11 years, and we have met I think on an average about once every 15 months. We met once to consider some bills before Parliament, but we have met generally upon the question of wages. We met upon the question as to whether the state of the trade does or does not justify an alteration in the rate of wages; but it has not worked particularly well, and of late we have not met, and whether we shall ever meet again I know not; but that we do very little business may be best proved by the fact that there is no paid officer. I think it right to mention that there is such a body, but it does not rule or govern us in any shape except now and then as to the question of an alteration of wages.

10,047. It is a voluntary meeting for the purpose of information?—It is a voluntary meeting, the decisions of which do not bind the minority, to decide upon what we are going to do with respect to the question of wages, but not as to the question of price. The question of price is never discussed; I conceive that it would be utterly impossible to fix the price.

10,048. According to your experience is the price settled by the bargaining between the buyer and the seller, between the party proposing the contract and the party who is about to accept it?—Yes. I recognize no other power.

10,049. Upon each occasion as it arises, you the parties settle the price according to the circumstances?—We settle without the slightest reference to any other man, I do not think that I ever asked any other ironmaster in my life what price I should sell at. Now and then two iron masters take a contract together, and of course they agree upon the price, but as a rule we are each and all perfectly independent.

10,050. We have been told, and probably the fact is so that you have no unions among the working men?—We have no trades unions at all. Some little time ago when the Commissioners wrote to me, I thought that the more convenient plan would be to put my general opinions in the form of a letter which I addressed to the Commission, and which is now on the table.*

---

* The following is the letter referred to:

Dowlais House, Merthyr Tydfil,
8th April 1867.

SIR,

I HAVE the honour to acknowledge the receipt of your circular, enclosing a paper of questions on the subject of trades unions. These questions I now return annexed with such answers as I am in a position to render.

I have been resident trustee of the Dowlais ironworks for above 11 years, during which period there have been employed here about 8,500 persons, a mixed population, chiefly of Welsh Dissenters and Irish Roman Catholics, of both sexes and various ages, either colliers, miners, or those engaged in the various branches of the iron manufacture. To the works are attached schools, on the unsectarian principle, in which are taught, under Government inspection, about 2,400 children; there is also a savings' bank and a reading-room, and there are sick funds, administered by the workmen, amounting to 3,000*l.* per annum.

There are therefore here existing all the usual incidents of a large manufacture, with the addition of a peculiar language and two very distinct races of persons. Also in the colliers and ironworkers we have two classes of workpeople who have played a very prominent part in the operations of trades unions and of strikes during late years in England.

Among the people exist about 50 benefit societies, numbering about 5,000 members; and there are in Dowlais 18 chapels, built and supported by voluntary contributions among the workpeople. The Welsh especially have great capacity for organization and self-government, as shown in these societies, and in their ecclesiastical arrangements. Combination, therefore, is well known among all classes, and for certain purposes largely had recourse to.

It, however, is a fact that for many years past we have had neither trades unions nor strikes, and although we have passed through very serious fluctuations in our trade, including periods of great depression, and wages have been both raised and lowered sometimes by considerable jumps, these occurrences have never produced a breach of harmony between employers and employed, nor have the works nor the collieries been brought to a stand. This remark applies to all the larger ironworks in the district.

I have therefore no personal experience of the working of trades unions, but my attention as an iron and coal master has for many years been much and anxiously directed to their proceedings elsewhere, and this is my reply to the questions as to my "position," and as to the "sources" of my information.

I. (1.) I am sure that the action of trades unions, as at present directed, does not tend to "improve the dealings and relations between workmen and their employers." They are opposed to the interests of the employers directly, and I think they tend to diminish trade, and on the whole and as now conducted are injurious to the general interest of the employed.

(2.) I can conceive no question between the employer and employed in the decision of which the union would operate beneficially for the general and permanent interests of the latter.

(3.) No direct experience.

Mr. G. T. Clark.

28 Nov. 1867.

10,051. Is there any class of workmen in your works whose wages are in a manner applied to the wages of all the other workmen. As to Staffordshire, we have heard for instance that when bar-iron is, say 7*l.* 10*s.* a ton, 1*s.* a pound in the ton goes for the puddlers' wages, and that the wages of all the other workmen rise and fall in proportion to the puddlers. Is there any such ratio as that with you?—There is an old custom which regulates the proportionate rate of wages, but which is not and cannot be strictly adhered to. I may say that I have had two papers drawn out which I thought possibly might answer the questions which the Commissioners were likely to put on the subject. One states the rates of wages in different classes of labour in 1866, which I have taken as an average year and this gives the wages of colliers, furnacemen, puddlers, and so on, up to those who produce the finished iron. The other paper represents the proportionate rate of wages. Assuming that the rate of wages in 1848 is represented by the figure 100, then I have calculated the rate of wages for every year down to 1867. Taking it in 1848 as 100, in the next year it is 90, the next 83, the next 75, the next 79, the next 83, the next 91, the next 100, the next 90, the next 100, the next 80, the next 72, the next 79, the next 87, the next 78, and the next 71. In the former paper the wages are taken for 1866 as representing the average of the later years.

10,052. (*Mr. Mathews.*) The chairman means to ask whether in fixing the rate of wages either for a reduction or a rise, you do not take the puddlers' wages as the standard upon which the other wages are to be regulated. When you give notice for a reduction of wages, you reduce your puddlers' in the first instance, do you not?—I do not see that it operates in that way. There is generally a certain proportion observed all through, but we do not begin with one class. The reductions apply regularly over the whole, either practically or theoretically, and we do not begin with one class.

10,053. (*Chairman.*) And I presume that the reduction over the whole is a per-centage reduction?—Yes, it is a per-centage reduction. You give notice that on such and such a day wages will be reduced so much per cent., and then that is easily adjusted. I

(4.) and (9.) In the South Wales iron trade, in which there are no unions, the workmen for many years past through some good and more bad times have received constant employment at wages as high as the trade would bear; whereas in England there have been in those years many strikes, much suffering, and a great destruction of those intimate relations which still subsist in South Wales between masters and men, very much to the advantage to both.

(5.) None personally.

(10.) and (11.) An amalgamation of unions necessarily increases their power, while it diminishes their knowledge of the circumstances of each particular district, or even Work, upon a thorough appreciation of which a settlement satisfactory to both parties can only be brought about. Where the amalgamation includes many different trades, or even the same trade in different countries, the power exercised is still greater, and the chance of discrimination or of considering each case upon its own merits still less.

(12.) I do not know, technically, what is meant by a trades council. If it be a council of selected employers and employed to hear complaints and regulate wages, I think this would be fatal to the great industries of the country, such as iron, coal, and cotton.

(16.) and (17.) I am not aware that the present law is defective upon any material point. It certainly in no way checks combination either of employers or employed, and it secures, so far as law can do, free action to both parties.

The great objection to a trades union is the moral and social intimidation which it invariably exercises over the workmen not in union. This it is beyond the reach of law to prevent, and the only remedy is in the general increase of knowledge, and of the principles of toleration and free trade.

II. (1.) Trades unions were for the most part established for mutual aid understood in the sense of a benefit society. Upon this has very generally been grafted the regulation of wages and hours of labour, the support of men on strike, and an interference with the freedom both of the individual members of the union and of the non-unionists. The ordinary casualties of a large manufactory have been observed over long periods and can safely be made the subject of a benefit or assurance society, but the statistics of strikes have not been so studied, and may or may not admit of being reduced to the same safe average, so that the employments of funds raised to meet a known demand to meet the contingency of a very different and unknown demand is a great injury to the interests of the subscribers. Societies for the support of workmen on strike, if formed, should be independent of benefit societies in the ordinary acceptation of the term.

(2.) Their effect has, I think, been to raise the rate of wages, but also to check the development of trade, and thereby proportionally diminish the wealth of the country and the total earnings of the working class.

(3) and (4.) It would be a poor compliment to the common sense of the Commission to suppose that there could be more than one rational answer to these questions.

It is the tendency and aim of trades unions to render equal the wages of those employed in the several branches of each trade, and in proportion as they succeed in this do they reduce the standard of skill, and place the less gifted man on a level with the greater. Piecework or payment by merit is the means by which the possessor of natural or acquired ability surpasses the man who is less gifted or less industrious, and by which all improvements are brought about. Beyond everything its tendency is to raise the character of the workman, giving him a strong stimulus to improve himself, and it removes the necessity for watching that he works his full time and does not idle. To pay all equally is to place all on the same dead level, and to remove any tendency to progress.

The limitation of apprentices and the attempts to check competition are of the same character and open to the same objections. Competition, though it often, perhaps necessarily, produces distress, is essential to progress.

III. (1.) I have, happily, and from the absence of trades unions here, no experience under this head.

V. (1.) At this time, in the Dowlais Works, when disputes arise they are most commonly settled by the head of the department. Should this fail, every workman is aware that he can see the general manager at any time, and have a full investigation of his grievance, and so well does this system work that these investigations are remarkably few, not over 30 in the year, and perhaps the best evidence of its success is, that out of 8,500 people employed, not two per annum find it necessary to seek the ultimate remedy of a decision in open court by the stipendiary magistrate. No court of arbitration could work better than this most natural and obvious method, and the existence of such a court would offer an encouragement to discontent on either side. Of all the devices of modern times I think this of courts of arbitrators the least practical, and likely to be the most mischievous.

(12.) I have no personal experience of large partnerships, but the practice of the last few years has been very favourable to their free operation, and has shown their weaknesses, and not, I think, any strength. Whatever may be the promise at starting, their direct tendency is always towards a numerous and individually irresponsible governing body, and this is about the most unfavourable condition for the management of any large commercial concern.

Speaking generally, it appears to me that the tendencies of trades unions are opposed to the principles of free trade and to personal freedom of action, and attempt to fix by artificial rules certain relations which long and bitter experience has shown to lie, happily, beyond human control. A strike, however injurious to both parties, is, like war, sometimes a necessity, and the fear of it has a wholesome and moderating effect upon all.

If any branch of trade be unduly harassed by the workmen it will fall off, and if the masters attempt to reduce wages below a certain point the men will leave them. In either case there is suffering, but the suffering has a tendency to work the cure.

It seems to me that masters and men should be left to take their course within the present legal bounds, to combine or not to combine at their pleasure. If the tendency of the unions be, as I think it is, to cripple trade and produce misery, their power will in time cease. Meanwhile the conflicting parties should be left to settle their own affairs, with as little interference as possible from without with natural laws.

I have the honour to be, sir,
your obedient servant,
GEO. T. CLARK.

J. H. Patteson, Esq., Secretary,
Trades Union Commission.

Mr. G. T. Clark.

28 Nov. 1867.

never heard of a dispute on that subject, but it is a question that an actual manager would be able to answer better than I can. I never heard the question raised, so that I presume that it is not a practically important one.

10,054. (*Mr. Mathews.*) In Staffordshire whenever we reduce wages, we fix upon the puddlers' wages as the standard, and we raise them 1*s.* according to the 20*s.* rise in the price of iron, or lower them 1*s.* according to the 20*s.* reduction on iron. You take, I presume, something like a money proportion or actual per-centage?—I think that I had better not answer a question which I am not able to follow out in all its consequences, but if the Commission should wish for information on that subject, I think I had better put the manager of the works before them. When notice is stuck up to the effect that wages will be altered, I believe that every skilled workman in the works knows at once how it will affect him.

10,055. (*Earl of Lichfield.*) How long have you been connected with the iron trade in Wales?—I think about 12 years.

10,056. During the time that you have been connected with it, has there ever been any combination among the men?—Not to my knowledge. No strike.

10,057. Have they ever taken action together to secure a rise of wages, or to resist a reduction?—No, there has been no strike, and I believe no combination that we know of, which I suppose is a sufficient answer to your question. I do not believe that there has been any combination whatever.

10,058. Have they taken any action at all in the matter?—Yes.

10,059. In what shape?—You hear a general voice when the men think that wages ought to be raised, and when the different gaffers walk through the works they are perfectly aware that the men think that the wages ought to be raised.

10,060, But it has never assumed the form of combined action on their part?—No.

10,061. (*Mr Roebuck.*) They have never waited upon you as representing anybody else?—Yes, once or twice I have had as many as 40 colliers coming to me to say that they really thought something ought to be done.

10,062. But did they state that they represented the rest of the colliers?—I dare say they would have done so. I pointed out to them that I really could not talk to 40 men, but that if one or two of them would come to me I would attend to them.

10,063 (*Sir D. Gooch.*) I suppose those are your own men?—Our own men.

10,064. You do not receive men from other works, say from Mr. Fothergill's works?—No. What would they say if I interfered with them? They would turn me out. Surely it is a question between the workman and his employer. We do not employ Mr. Fothergill's men.

10,065. (*Mr. Hughes.*) But you say that you have told the 40 men that they had better appoint one or two to come to you. You thought that that would be the best way, I suppose?—Certainly, you cannot well talk with 40 men.

10,066. Therefore you think that any arrangement which would enable them to be so represented to the master would be a good one?—If 40 men come to me and tell me that they have a grievance, I tell them that they had better appoint two or three men to come and talk to me about it.

10,067. And you think that a better arrangement both for master and for men?—I do.

10,068. (*Mr. Mathews.*) Assuming that you would receive these 40 men if they were wholly in your employ, you would decline to receive any men not in your employ, I suppose?—I could not decline to receive any workman who came to me and told me that he wanted to speak to me, but if he came to speak to me about what I paid my men, I should say, "My good friend, that is not your business."

10,069. You have nothing to do with any other men but your own on any question relating to wages or the details of your work?—No.

10,070. (*Mr. Hughes.*) But supposing that these men who came to you as representatives, not only represented the men on your own premises, but also happened to represent the men employed at half a dozen neighbouring places, and supposing that you came to terms with them, would it be a disadvantage that their actions should bind also the men in the neighbourhood?—If I went on (which I probably should not do) with the affair at all, I should endeavour to eliminate the representative element outside the works from the representative element inside the works.

10,071. Then though you think that it would work well for the men to be represented as a body in each particular work, you do not think that it would work well for them to be represented as a general body in the neighbourhood?—That is an inference of yours I think, and not a statement of mine.

10,072. You have told us that you think it would be a beneficial thing, if instead of 40 men coming into your room to consult you on a question of wages they would appoint one or two who would confer with you upon the subject?—Certainly, because the 40 would all want to speak at once, whereas one or two men are easier to talk with.

10,073. And that I understand to be the objection of all representative institutions to prevent the whole mass of the world talking. You think, as I gather from you, that you can draw the line sharply between the men of any one particular establishment in a district, and the others and you think that it might be, (I will only say that it "might be") beneficial that the men of one establishment should be represented by one or two, but that it would be certainly harmful that the whole district should be represented in that way?—I think that it would be equally injurious that the workmen in any one district should be represented by one or two, or by one or two dozen. If the colliers in a district have a grievance they can come to the coal agent and discuss the matter with him and settle it, but if the colliers, and firemen, and puddlers were all to come together, they would be mixing up very different things.

10,074. (*Earl of Lichfield.*) Have you always been ready and willing to receive deputations of your own men, to talk over with them the subject of wages?—Certainly. My own men are like my own children, and I should as soon think of refusing to listen to my own child as of refusing to listen to any man who came from the works to talk to me on any matter, because I think it of equal importance that my men and I should be on good terms as that I should be on good terms with my own family.

10,075. We have heard that there is a considerable difference between the price of iron in Wales and the price of iron in the north of the country, and in Staffordshire, are you aware what that difference is?—No, I am not. I happen to have had lately brought under my knowledge the fact that we cannot compete with Middlesbro' for ship plates, a manufacture which we have lately introduced into our part of Wales, because they have the advantage of the sea. The Commission will hardly follow me, perhaps, when I point out how completely isolated in manufactures we are from England.

10,076. But in the case of ship plates I understand you that they can be produced cheaper at Middlesbro' than in Wales?—Middlesbro' plates can be sold cheaper in London than Welsh plates, because Middlesbro' is on the sea. I can only tell you the fact that Middlesbro' people can undersell us in ship plates on the Thames.

10,077. That applies also to the foreign trade, I suppose?—Taking London as a point of departure, it applies, of course, to a large part of the world.

10,078. We have been told that you can produce iron (I think rails have been more particularly referred to) at a considerably cheaper rate than they

can be produced in Staffordshire, or elsewhere?—I do not know that that is the case.

10,079. Has not a large contract for rails been taken at a very low price by some Welsh houses?—I do not know that, but I know that we have taken, and are taking, contracts at low prices, and I know that some of our neighbours are occasionally taking contracts at low prices, because they are willing to lose money upon those contracts. I mean that the fact of a house taking a large order at a low price must not be looked at alone; there are other questions which are to be taken into consideration in determining what that means. It means, generally, that the trade is very bad.

10,080. But we have been told that you can produce iron in Wales at a lower rate than in Staffordshire and the North, and the reason assigned for that has been partly that the wages in Wales are considerably less, and by other witnesses it has been stated that that is in consequence of your employing in Wales a considerable number of women and children?—We do employ in Wales a considerable number of women and children. I suppose we shall cease to employ them soon, and as I think, happily. The great difficulty is in the people themselves, they wish to be employed, and they object not to be employed. I believe that the Act now about to come into operation will affect that question materially, and I am very glad of it.

10,081. Your own opinion is against their employment?—I think it a monstrous thing that a woman should be working out on the hillside, and exposed, on a wet day.

10,082. Do you think that the employment of women and children in your part of the country has a very sensible effect upon the cost of the production of the iron?—I have no doubt it has, because there is a certain labour that women and children do, and if you had not women and children to do it, you would have to employ full-grown men, no doubt.

10,083. With regard to the wages paid to the men, we have been told that they are considerably less than the wages paid in Middlesbro' and in Staffordshire, are you aware that that is so?—I am not acquainted with the Staffordshire wages, but I am with the Welsh wages. I have had a careful list made out, which is now on the table.

10,084. I suppose we may conclude that if more women and children are employed in Wales about the ironworks the wages for men would, as a matter of course, be lower than they would be in other districts where women and children are not employed to the same extent?—I do not see, myself, that it has that effect upon the other descriptions of labour. It has an effect upon the cost of producing, but I do not think that it affects anything else. It is a matter of opinion, however, and probably any one else could form as good an opinion as I could. It will soon be removed.

10,085. Have you found that the Belgian iron trade has interfered with your trade at all?—Yes.

10,086. To what extent?—To this extent,—that every now and then we hear that an order goes to Belgium. We apply for an order, and tender as low as we can, and then we find that it has gone to Belgium. That does not very often happen, but it does happen, and it has a tendency to check prices in England.

10,087. (*Sir D. Gooch.*) I presume that in employing women in this work and similar work there is not the great economy to the master as against employing men that might be supposed, inasmuch as though a woman is paid less money she does not yield the same amount as a man?—No; but in making bolts, and screwing nuts, and those small matters, there are many things that a woman or a boy can do (like a door boy in a colliery) as well as a man. It will be a blow to us, no doubt, to have a check put upon the labour of women and children, but I suppose we shall survive it somehow.

10,088. (*Chairman.*) Do the women so employed become prematurely old?—Strange to say, they do not. If you were to see on Sunday those Welsh women who work out in the open air you would find that they look as healthy as possible. We have, or had until the last few months, a large industrial school, where 80 or 90 of the women came in the evening to sew. They come in their working dresses, and all we require is that they shall wash their hands and faces, and if you were to see them sitting round the table and singing as they work (the Welsh are very musical), I think you would feel convinced that they were in a very respectable state of health.

10,089. Take an Englishwoman at 30, and a Welshwoman employed in this work at 30. Have you ever cast your eye over their countenances with a view to that test of the effect of the work?—I have, but I certainly have come to the conclusion that the Welsh women look uncommonly well. But I am not exactly unprejudiced on that point. Seriously, I do not think that it either shortens life or affects their looks, but I think it wrong on moral grounds.

10,090. I will put the question with reference to the Irish women, because the notion is that they come to premature old age in consequence of their hardships; have you ever made a comparison of your Welsh women with the Irish?—I think that field labour, which is generally accompanied by low wages, and probably insufficient wages, affects women very much. You see it in Italy, and you see it in England, in the case of the women employed in field labour, but the Welsh women employed in out-of-door labour do not age nearly so much as I should have expected.

10,021. (*Mr. Booth.*) Do you attribute that circumstance to the higher rate of wages that they are receiving than the ordinary wages of women employed in field labour?—It must be remembered that they are not women alone in the world, they are for the most part either the wives, or more generally still the daughters of the men employed, and the whole family earnings go together, and in that way the family do very well. The Welsh in the immediate neighbourhood of the ironworks live in a state of very considerable comfort. I can appeal, I think, to Sir D. Gooch, who knows the country. If you go up the main street of a Merthyr Ironwork you see the fire, the chest of drawers, and the clock, and other signs of a great deal of comfort.

10,092. (*Earl of Lichfield.*) You have told us that there are no unions among the men in your district; are there any provident societies established among them?—A great many. The Welsh are very remarkable for their power of combining, and their power of self-government. Their power of self-government is something marvellous. For instance, in our schools, which are large, nine-tenths of the people are Dissenters; they go to their own chapels, they build their own chapels, they pay their own ministers, and they manage the matter entirely themselves. There are, I think, 18 chapels in Dowlais alone, erected by voluntary subscriptions, and supported entirely by the voluntary subscriptions of the people. With respect to benefit societies, I think there are about 50 benefit societies, and they are supported by about 5,000 members.

10,093. Can you give us any particulars as to any of those societies connected with the men in your own employ?—They are very jealous of interference, and I never interfered in any shape (and they would resent it I think if I did), except that they used to meet in public-houses, and ten years ago we remonstrated, and said to them, "If "you will meet in our schoolhouse you shall have a "fire and light, and a room to meet in," and many took advantage of that. We have a fund in the works independently of these.

10,094. These societies are benefit societies that hold out great advantages?—They are pure benefit societies that hold out great advantages.

10,095. And they are well supported by the men in your employ?—Yes, very well supported. I am chairman of the Board of Guardians, and therefore I

Mr. G. T. Clark.

28 Nov. 1867.

have the means of knowing a good deal about the condition of the poor.

10,096. In short in that district they must be of very provident habits?—Well, these facts which I tell you are true, but there is a great deal of drunkenness in the district I am sorry to say. The facts being as I tell you, they are certainly provident as a mass, but one's eye is struck with the amount of drunkenness, though there is much less than there used to be.

10,097. (*Sir D. Gooch.*) You say that you have a benefit fund in your works?—At the request of the men we stop 2*d.* in the pound of the wages, and we pay that over to a treasurer, and it is divided among the firemen, colliers, and miners funds. Each class of workmen elect a committee. We give them a room to meet in, and they distribute the allowances to the sick according to their own fashion. We do not interfere at all except to this extent; when I first came to Dowlais the chairman of each committee was a Dowlais agent; I thought it better to leave them to manage the thing themselves, and therefore abolished that arrangement; but four years ago I found that the funds were getting into a bad state, and that there was a good deal of mismanagement, and I suggested to them that as we did them the kindness of stopping the 2*d.* at our pay-table (which we would rather not do), we had a right to see that it should be properly administered, and the Dowlais cashier suggested a certain check system. That has been followed, but there has been no further interference, and the fund is now flourishing.

10,098. Does that include the medical fund?—No, besides that there are two funds for which 2*d.* more is stopped; one is for the provision of doctors, and the other of schools. Out of the medical fund we pay the staff of doctors and find the drugs. Out of the school funds we support the schools. We have 2,400 children in our schools. We get a vast deal more money out of the Government than we should do, indeed we are the largest recipients of the public money, but we fulfil all the conditions, and if we get the money we have a right to do so. The company find the school buildings and playgrounds. We are out of pocket upon those items, and upon those items alone, about 500*l.* a year, but everything else is supported either by Government or by the 2*d.* in the pound stopped, or by 1*d.*, and in the first class 2*d.*, which is paid week by week by each child. Last year when the cholera was raging there was a great excitement in the place, and I may say that the people went almost mad (as people do sometimes on such occasions), and they came to me about some matters that were ordered by the Board of Health; but they also said, "We really think that we ought to manage our own affairs entirely." "Well," I said, "10 years ago I wished it; we did not wish to under-"take schools or doctors, and if you think that you "ought to manage these matters yourselves be it so, "and I will give the notices." We did so, and notices went out to all our numerous staff of teachers and doctors that in three months they were to leave. Before the three months were over the current set the other way and we had all sorts of applications, and at last there was a very large meeting convened by the men which I attended, at which they asked us to go on with the present state of things. I took some trouble to explain to them that we got no money advantage out of it.

10,099. The Board of Health is very much composed of the men themselves I suppose?—No, it represents the entire district of Merthyr, and there are no workmen in the Board of Health; it would be a great deal better if there were some. The members are tradesmen chiefly.

10,100. (*Earl of Lichfield.*) The schools are mainly supported by the contributions of the men employed at the works?—The schools are not voluntary, they are mainly supported by the forced contributions of the men at the works. We do not give any individual workman the option of refusing to pay to the school. I wish it was otherwise, but we should get no schools if we did give that option.

10,101. Do you find cottages for the men employed in your works?—No, we are cottage owners in common with a great number of other persons, but we do not find cottages for them. The ambition of a Welshman, like that of a Cornishman, is to possess a cottage, and when he has saved 50*l.* he builds half a cottage and mortgages it for the other 50*l.*

10,102. (*Mr. Mathews.*) How does he procure the land?—He gets the land on lease from anybody. We are always ready to give a leasehold.

10,103. It is leasehold not freehold?—It is 99 years. We try to make him as independent as possible. We want to dissever politics from ironmaking, with which we think it has nothing to do.

10,104. (*Earl of Lichfield.*) Have they any difficulty in obtaining freehold if they choose to purchase it, and if they have put by sufficient money?—No, only that the place is getting rather crowded, and they do not like to build on the outskirts, they would rather build in the centre.

10,105. The whole of that is a mining district I suppose?—Yes, and it is on the edge of mountains, so that if a man were to live a mile off from the centre of Dowlais it would be a different thing from living a mile off from the centre of Westminster.

10,106. If a man purchased a plot of ground there for a freehold would he not have to pay for the mines as well as the surface?—No, Dowlais is a mining district, but we are on the northern crop of the minerals, and the houses for the most part are built on ground which is outside the basin, and the few houses which have been built upon ground that is mined are in a most dreadful state, and we should be most happy to get rid of them, but the people cling to them. That, however, does not apply to above 50 or 60 cottages. The cottages are on solid ground for the most part.

10,107. (*Sir D. Gooch.*) They cannot get freehold there at all?—A 99 years' lease. We give freeholds for other purposes, for instance, for burial ground, and we also give ground on easy terms to a chapel.

10,108. Yours is only a lease is it not. It is partly freehold. The minerals are leased on a very long lease, it is the second lease we are working on now.

10,109. (*Earl of Lichfield.*) Have they generally gardens let to them with their cottages?—We have tried that, but we are 1,000 feet above the sea, and 1,000 feet above the sea, with a certain amount of smoke such as you get there, does not improve vegetation. I have a garden of my own, but I cannot grow green peas in it. We tried letting out a market garden, but vegetables can be brought so much more cheaply from the vale of Glamorgan than they can be grown on the spot, that the garden amounts to nothing.

10,110. (*Mr. Booth.*) In the answers that you have been kind enough to send to the printed questions, you say that in South Wales where there are no trades unions, the workmen have for a number of years had constant employment, do you attribute that circumstance in some degree to the absence of trade unions?—When the men have any difference with the master the question is settled then and there within the circuit of the works, and I conceive that that is a very easy way of settling a dispute. Every man who comes there has an interest in getting it settled; they are all workmen, and there is no man who lives upon a strike, or would live upon a strike in the event of its occurring. They wish to get it settled, and they do get it settled. There is this curious fact, which I have mentioned in my letter, that there being in the works the large number of people I have spoken of, when there are disputes the men go to their immediate superior, the agent who is immediately in charge of the department; if they cannot settle it with him or the gaffer they go to the manager, if they cannot settle it with the manager, they go to the stipendiary magistrate of the district who is a barrister, a very competent person, and a very just man. The manager tells me that he has had 30 cases per annum that have come to him,

and the stipendiary magistrate tells me that on an average about two cases per annum have been before him. Therefore I think that I have a right to say that our system works well. The men are an exceedingly sensible race of men.

10,111. I presume you think that a master is a better judge what wages he can afford to pay so as to keep his works going, than any trades union can be?—I think that the masters and men together are the best judges.

10,112. The best judges of what the master can afford to pay?—It is like a double hammer; you meet in the middle, and the heaviest shoves the other a little one way or a little the other. Now, at this present moment, everybody knows that in Wales we are earning no money by iron making, and that there are a great many losses. If the thing were settled theoretically wages ought to go down, but for various reasons they do not go down. The fact is, that beyond anything it is important to be on pleasant terms with your men, and it does not do to be on the look out to screw them down. You deal liberally with them, and then if they know that you have a heavy contract they will not throw you over.

10,113. Do you think that in places where trades unions prevail the attempts of unions to force up wages when circumstances do not admit of a rise are, in the long run, productive of injury, or of benefit, to the men?—Well, I have had no experience of trades unions, I am happy to say, but as I tell you the question is settled by us between parties who are deeply interested in its speedy settlement, and I conceive that any question, whatever it may be, whether of wages or not, is more likely to be settled if it is confined to two parties who are most deeply interested in its speedy settlement than if you import into it other people who are not.

10,114. (*Mr. Hughes.*) Then I understand you to say that you think it right that the men should have a voice in the settlement?—Am I to call the man to me and tell him what I am to pay him?

10,115. You were asked just now whether the master was the best judge of the matter; you say the master and the men together are the best judges?—Yes.

10,116. And you think that the men therefore ought to have a voice?—And they do have a very substantial voice.

10,117. (*Mr. Booth.*) The question was, whether a master was not the better judge of what he could afford to pay so as to keep the works going than a trades union could be?—Yes, I think he is. But then I am a master. If the men came to me and pressed me at a time when I was making no profits for a rise of wages, I should say, "Come now, really this is "absurd, this won't do. You all read the papers, I "know, and you can see there what is going on in "the world."

10,118. The master who has to pay the wages must judge whether he can afford to pay more?—Yes. Sometimes it his interest, however, to give way, and to pay more than he thinks right.

10,119. I said with reference to keeping his works going?—Yes, or keeping the men together.

10,120. (*Sir D. Gooch.*) Is it a constant practice of the ironmasters in Wales to keep their works going for the men, though at a loss to themselves?—At this very time it is being done. The owner of a very large Work and a wealthy man told me that he was paying a large number of his men from something short of 21*s.* up to 26*s.* a week in order to keep them together, in the hopes that times would mend. That master has at the present time a perfect village of puddle bars in stock.

10,121. Do you think that unions tend to introduce a different feeling on the part of the masters?—I need not tell you that under those circumstances a strike would be, to a certain extent, a gain. But the master in question looks further than that. He says, "I should "be glad if I could be saved the trouble of supporting "these men, but if I let them go I may lose them "altogether, and, moreover, these are men that worked "for my predecessors, and where would the good feel-"ing be?"

10,122. (*Mr. Booth.*) He could not so well afford to go on thus supporting the men if there were a trades union in the neighbourhood, which as soon as trade became brisk again would insist on a rise of wages?—I suppose that if there were a trades union at his place even the trades union would say, "Really we cannot expect you to pay the men for doing nothing."

10,123. But as soon as a rise came would they not say, "We must have a rise of wages without reference to bygones"?—Really I do not know, not having had any experience of trades unions.

10,124. (*Sir D. Gooch.*) Is it your experience that the good feeling that exists between masters and men in South Wales is productive of comfort to the men in the way you describe, namely, that they are kept on at times when there is no profit to the master?—It is productive of a very good feeling. A very kindly feeling has always subsisted, I believe, between masters and men there. The masters live among the men, and the men have access to them at all times, their difficulties come to the surface, and I conceive that that is not only a good thing socially, but also, speaking as a manufacturer, I conceive it to be an excellent thing, and I think that if I could not meet my own men, and if a person who represented, not my men alone, but the whole district, came to me to discuss questions, that feeling would be broken into, and I do not think that we should settle matters so advantageously to both parties.

10,125. (*Mr. Mathews.*) Anything that would disturb that genial feeling between master and men would not only be a misfortune to the particular works, but would be a general and social evil?—Yes; I think so.

10,126. (*Chairman.*) Is any of that good feeling attributable to the Welsh quickness of temper, which shows itself in a moment when they are out of sorts, and makes them very soon recover again?—The Welsh temper is no doubt warm. They are peculiar in many respects. They are very musical, they are fond (there is no accounting for taste) of hearing lectures, and there is hardly a week that they do not come and ask for the schoolroom, and sometimes they have a concert, and do me the honour of asking me to preside. One is exceedingly glad, of course, to meet them on those occasions, and when I meet them publicly, which I do many times a year, we are very good friends indeed.

10,127. Have you an admixture to a great extent of Saxons, because when we in Somersetshire found that any uncomfortable man was gone away we always thought that he was gone to Merthyr?—I have heard eminent Judges say that they were wonderfully struck at the small amount of crime committed in the Welsh districts; and we attribute that amount of crime which is committed to the English who come over.

10,128. It is not a sufficient number to disturb the good feeling which you have described?—The number of English employed in the works is small, but there is another element far more important, that is the Irish. The Irish are for the most part not skilled workmen, but labourers. The Welshman does not like them. I do not think that he keeps them down, he would if he could, no doubt, but other circumstances prevent that. We have a very large number of Irish. I do not know how many, but we treat them in all respects as we do the Welshmen, in fact so far better that they have a school for themselves, which of course is a Roman Catholic school. There is a Roman Catholic priest, with whom I am on excellent terms. We have never had an Irish row. I believe that they are one and all Fenian sympathisers, and I daresay they all subscribe, but I can only say that they are perfectly orderly.

10,129. (*Mr. Mathews.*) Is the Roman Catholic priest a better educated man than sectarian ministers?—We have some admirable Dissenting ministers in our district, but we have some who are tradesmen,

Mr. G. T. Clark.

28 Nov. 1867.

and I confess that I do not like a minister of the gospel to be in a position to be accused of dealing out sanded sugar.

10,130. (*Chairman.*) Dissenting ministers have been always reported as having very great influence indeed with the population, quite as much or more so than Roman Catholic clergymen in the Roman Catholic part of our kingdom. When for instance the men in Wales meet about schools or otherwise, do they meet from a spontaneous movement on their own part or from the influence of the Dissenting minister?—My observation goes precisely to what you say; I believe the Dissenting minister to have more influence with the Welshmen than any man living, far more than his master, and far more than the Roman Catholic priest has with the Roman Catholics in Wales, because the Roman Catholic is unhappily often so ill-educated that he is below those influences which the Dissenting minister exercises. The Dissenting minister does not interfere about the question of wages at all, at least I never heard of a Dissenting minister interfering about the question of wages; but on any question such as an outburst of cholera or anything of that sort, you are perfectly certain that you will have their support in doing the thing that is right. They (not the Wesleyans) are a little given to interfere in politics.

10,131. With regard to these ministers, have they followed the teaching of Whitfield?—Yes, far more than that of Wesley. Wesleyans, though they are a highly respectable body, are a small body there. Dissenters are mostly Calvinistic Methodists, Baptists, and Independents, and there are a good many Presbyterians.

10,132. (*Earl of Lichfield.*) Everything appears to go on very smoothly and comfortably between you and the persons whom you employ. Are you aware whether the same comfortable state of things exists between the masters and the men at other works in your district?—It does at Cyfartha, Aberdare, and Plymouth, which, with Dowlais, form the "Merthyr Works." Penydaran, which belonged to Mr. Forman, was unprofitable, and has been shut up. Over the hill we have many other works where I never heard of any differences. I believe they get on very well. I believe that as a general rule the masters and the men in the hilly country of South Wales draw well together.

10,133. You are probably aware of some cases then in which they do not get on together as comfortably as one would wish?—Round Pontypool there is a strong Staffordshire element, and they do not get on so well there certainly as they do in the pure Welsh district.

10,134. What do you mean by saying "a strong Staffordshire element?"—I mean that there are masters there who have imported men and managers from Staffordshire, and they follow, I am told, the Staffordshire customs rather more than the Welsh customs. They have few Welsh and a good many English, while we on the other hand have but few English and a good many Welsh.

10,135. (*Mr. Mathews.*) Are you aware of any delegates being sent from South Staffordshire into the Welsh districts to exhort the people to form unions?—I have heard of it. I did not know it personally. They came, I believe, asking the Welshmen to subscribe. Now your Welshman is (like the Scotch Highlander) penurious, and you may be sure that he will not pay towards putting money into the pocket of the English.

10,136. Supposing that delegates did go from South Staffordshire to ask the Welsh at Pontypool to contribute to that payment, their success was not great?—I do not know what was done at Pontypool. We were in a little alarm about it in our valley, but nothing was done.

10,137. When you say "alarm" you mean that you very much deprecate the interference of unions?—I very much wish to settle any difference with my own men myself, and not to have any stranger imported.

10,138. When you speak of the Staffordshire element in Wales do you refer to the masters who have gone into the district, or to the men who have shifted their employment?—I am speaking of what I do not of my own knowledge know, but it is a well-known fact that some of the masters of the works at the Monmouthshire end of the iron range have imported Staffordshire agents, who have employed Staffordshire men, so that there is frequently a clashing of the customs of the two districts.

10,139. Does it originate with the masters or with the men?—I do not know at all.

10,140. (*Earl of Lichfield.*) Still as a fact, you know that in some instances there is an uncomfortable state of things existing between the employers and the employed?—The works down there belong, some of them, to joint stock companies I believe, and that does not tend to produce harmony. The manager of a joint stock company, or the chairman of a joint stock company, has not the power that a man who stands alone has, and that creates a difficulty.

10,141. Can you give us any information upon a point which has been raised before us as to the proportion of the total cost of the production of a ton of iron that is represented by wages?—That is not a very easy question to answer. Of course there is the royalty, which goes in as an element, there are rates and taxes, and there is the cost of selling, which is partly labour, namely, the labour of the persons employed to sell, but beyond that I should say it was all labour.

10,142. Would you consider five-sixths an over estimate for labour?—No; it is a question that does not admit of any other than a general answer, but speaking roughly, I should say that all those rates and taxes and elements of that sort, may amount perhaps to 10*s.* a ton, and over the last eight or nine years the profits of iron in South Wales have been certainly not ever 10*s.* a ton, and I conceive that all the rest is labour; that, with bars at 6*l.*, would be about five-sixths going to pay labour.

10,143. (*Mr. Mathews.*) I think you stated that there is very little profit in the iron trade now?—No profit on iron now; a little on steel.

10,144. Putting out the element of profit, the labour, exclusive of royalty and other little incidental charges which would not be much on a ton of iron, would be five-sixths, you say?—Yes.

10,145. (*Mr. Hughes.*) When you say there is no profit, do you calculate the profit after deducting interest on capital or before? Is there no deduction made before you reckon profits, for interest on the capital invested in the works?—No, we make no such deduction. We recognize two descriptions of capital. One is the floating capital which is invested in bills, in money at your bankers, largely in stocks, in iron made, and so on; that is to say, which is turned over in the course of the year. Another description of capital is that which is invested in steam engines, railways, coalpits, and so on. Now that description of capital, which of course is an enormous one, we utterly ignore, and I believe that the reason that we have done well whereas railways have not done well is, that we have stoutly resisted a capital account. We at Dowlais have to pay everything as we go, and I believe that to be the only healthy system for either railways or ironworks to be conducted upon.

10,146. (*Mr. Mathews.*) You have closed the capital account for some time?—Yes, we know nothing about it; we once paid Mr. Stephenson a large sum for valuing it.

10,147. (*Mr. Hughes.*) The simplest production of iron is pig iron, I take it?—Yes, we make about 3,000 tons of pig iron in the week.

10,148. What you want for that is ironstone, limestone, and coals?—Yes.

10,149. What is the present price of pig iron per ton?—I cannot answer questions of price; we do not buy pig iron, we make pig iron and we sell it. I cannot tell offhand what it is, because our pig iron varies so much. For instance, we are selling it for tin-plates, that is a high description of it.

10,150. How much per ton for wages is paid on pig iron?—That I cannot tell you further than you

have it before you. I looked upon those as trade questions, which I conceived the Commission would hardly press me upon.

10,151. We are very anxious to ascertain if we can the proportionate amount paid for labour and for materials, that is to say for all the minerals used in pig-iron and for wages?—The question with us is very much complicated. We buy a great deal of iron ore from distant places.

10,152. (*Mr. Harrison.*) In your answer just now you said that five-sixths of the cost were expended in wages; you include in that I suppose the wages of clerks and managers and so on?—Yes.

10,153. But that is a portion of the cost which does not vary along with the reductions of the workmen's wages?—The amounts paid to your coal agent, your general manager, and so on, do not vary, but a reduction affects every man who is paid weekly. The proportion paid in management is very small.

10,154. Could you give us any calculation to show what proportion of the cost of a ton of bar iron represents those wages which are paid weekly, and which fluctuate upon a reduction or a rise in the price of iron?—I have no doubt that with a good deal of trouble I could get all that out, but speaking candidly these are times when ironmasters are set upon pretty heavily on all sides, times in which we can hardly hold our own, and therefore times when one must be exceedingly careful what one says.

10,155. I am asking for the average roughly?—I cannot say what it is.

10,156. You think it would be very difficult to make such a calculation?—Yes, to make it minutely; but to get an opinion, which on the whole should be pretty true, would not be very difficult; it would involve some little trouble, that is all.

10,157. The question arises in this way. The argument has been put thus: When the selling price of a ton of bar iron falls it is absolutely necessary to reduce the wages immediately, because the wages represent nearly the whole of the cost?—We do not do that.

10,158. If you reduce the price of your bar iron 1*l.*, do you find it absolutely necessary to reduce the wages of every man on the works 10 per cent.?—No, because we draw upon our capital. If you moved always up or down with the selling price you would be in a state of perpetual hot water. You must bear it; that is both your gain and your loss. You must bear the loss in one case, and take the profit in the other.

10,159. (*Mr. Hughes.*) And on an average of years that system, I suppose, pays?—Yes. The profits in iron making are as nearly as we calculate them 10*s.* When I say that Welsh ironmasters are not making anything by making iron, I should add that we are making steel, and that there is a profit made on that, but not much. Then again we are making money by selling coal. I do not say that we are coming upon the poorhouse, but as regards iron we are making no profit.

10,160. (*Mr. Harrison.*) I suppose that the payment of the greater part of the manufacture of iron, puddling, and so on, is by the ton; that it is piecework in fact?—Yes.

10,161. The men consequently will receive at the end of the week a proportionate amount of that which they have produced, and their earnings will differ man by man according to that which they have produced, will they not?—Yes.

10,162. Is each puddler paid the same price for the puddling of a ton of precisely the same quality?—Yes, he is.

10,163. I am speaking of a case where the iron is precisely the same. Supposing that the same quality is taken off the same heap, and there are two puddlers side by side at two different furnaces, are those men paid the same price for the ton?—Yes, they would be, but puddling is an eminently skilful occupation, and I am sorry to say that the old race of puddlers are dying out. There are, however, a few remaining, and an old puddler, though he does not get a higher rate, would certainly earn more, because he turns out more.

10,164. As a rule the pig iron supplied, being precisely identical in quality, puddling is at a certain rate per ton through the works?—Yes.

10,165. (*Mr. Roebuck.*) Is there much difference in the skill of one puddler and another?—A great deal.

10,166. I do not mean as to the quantity, but taking one piece of iron that he puddles, will one man make it better than another man?—Certainly.

10,167. So that different puddlers will produce different qualities?—Yes.

10,168. (*Mr. Harrison.*) You make no attempt to pay them differently for the same quantity of the same iron?—No. But the good puddler would make it quicker.

10,169. (*Mr. Booth.*) And so he would gain more wages?—Yes; if it were a question of parting with puddlers, you would not part with him. If it were a question of supplying some one with a cottage, of course you would let the skilled puddler have it before the unskilled one.

10,170. (*Mr. Harrison.*) It has been suggested, and we have had it in fact in evidence before us, that the operation of the union is to produce an uniformity of earnings, so that the value of individual skill is lost and that it would be better if each man were paid simply with respect to his special individual skill. Now, what I ask you is, in the total absence of anything like unionism or any combined pressure in the matter, do you at your works pay each man according to his individual skill, or do you meet him in this way, "We pay for a certain distinct class of iron a certain "price for puddling per ton, and the better workman "gets the advantage in every way"?—I will undertake to say that if you were to compare the skill of the workmen with the money received at the paytable, you would find that the skilful man, if he was also prudent, would earn most wages.

10,171. That of course is the case in all ironworks throughout the kingdom, but the question is this, whether throughout your works in the case of two men puddling each a ton of precisely the same iron, the one receives a different sum for that ton from that which the other receives?—No. The same rate.

10,172. (*Earl of Lichfield.*) Would any defect be easily detected when the iron comes away from the puddlers' furnace?—No.

10,173. Then would you have an opportunity of judging of the quality of the iron so as to enable you to give a sum in wages in proportion to the quality when it came from the puddlers' furnace?—Yes. There is only one way of judging of the quality of iron, that is to test it, and you could not test it in the shape of a puddle ball; you must roll it into a bar and then test it. There is an inspector who looks at the bars as they come out, and he cuts off a little bit now and then to see if it is right, and in that way you know accurately enough what they are doing.

10,174. In point of fact, it would be very difficult to pay a puddler according to the quality of the iron he produces?—Within certain limits it would, but if he sent out a very bad lot, and if it was obvious that there had been considerable neglect, you would come down upon him.

10,175. (*Mr. Harrison.*) But you are not aware that there is at your works greater discrimination in the different rates which men are paid in the same works than in Staffordshire?—No, I am not.

10,176. (*Chairman.*) Are your colliers bound to carry out quite the same rule that is adopted elsewhere, of limiting the coal that each collier sends to bank?—They do as much as they can; they send what they please. Our great difficulty is in getting enough.

10,177. That is the case elsewhere, but each man is limited as to the amount which he may get by his fellow-workmen?—The vice of the collier is to be idle; he will stay away on Monday and Tuesday, and then he comes in and makes the most of the

Mr. G. T. Clark.

28 Nov. 1867.

remaining four days, and he sends out as much as he can.

10,178. (*Earl of Lichfield.*) What is the difference between the cost of skilled and unskilled labour in your district?—Very considerable; it ranges in the list I have given in from 12*s.* and 15*s.* to 65*s.* 9*d.* a week.

10,179. I think I rightly understand from you that the wages of the men in your employ have remained pretty stationary during the last few years?—No, they have ranged during the last few years in the ratio to 100 of 71, 88, 79, 82, 80, and so on.

10,180. But there has been nothing like the same fluctuation in the price of wages in your district that there has been in Staffordshire?—I do not know. It may seem strange to the Commission that I should be ignorant of what goes on in Staffordshire, but it is so. Those figures in the paper which I have handed in, are the average payments of all classes.

10,181. Could you tell me the highest rate of wages that a puddler has earned during the last three or four years?—The highest that an average puddler has earned is given in the paper put in.

10,182. Could he have earned during the last three or four years as high a rate of wages as 10*s.* 6*d.* a ton?—I do not know. I am not sufficiently acquainted with the detail to answer that.

10,183. The highest rate in Staffordshire has been about 10*s.* 6*d.*, and the lowest rate has been 7*s.* 6*d.*; are you aware of that?—Perhaps the Commission will allow me to say that I came in a state of complete ignorance of the iron manufacture into the trust of the Dowlais works. It was an enormous affair, and I had to conduct its local management alone, and I found myself much better able to attend to finance than to the mechanical details.

10,184. Still it appears to me to follow as a matter of course that there has not been the same fluctuation of wages in your district that there has been in Staffordshire, seeing that in Staffordshire the wages have been dependent upon the price of iron, and that whenever iron has risen 1*l.* a ton in price, wages have been raised 10 per cent., and have fallen in the same proportion when iron has fallen?—Nothing surprises me more than to read in the papers that there has been a meeting of Staffordshire ironmasters, and that they have fixed the price of iron. We could no more do that than we could fly. In the first place we seldom turn out two batches of rails made to the same specification. The Great Western people, for instance, come and say, "We will pay you the highest price "and you must give us the highest description of "iron." Others will send and say virtually, "We want rails, we do not much care what they are." So that we seldom sell two batches of the same price, and nothing puzzles me more than to be asked what the price of rails is.

10,185. (*Mr. Harrison.*) You spoke of having had some meetings, which were not continued, for considering what should be the rates of wages, whether wages should be reduced or raised, and so forth. Now in considering the rates of wages do you take into consideration the supply of labour or any other matter than the selling price per ton of the iron?—At this present time if America were closed I have not the smallest doubt that wages would go down, because we know perfectly well that the collier has America under his lee and he can go there. He may come back again if he goes it is true, but still he may go. That is a great check upon the price of labour in England.

10,186. You do not think that wages in ironworks can be absolutely determined by the selling price of a ton of iron?—With regard to wages over a long period, I suppose it is a question of political economy to what extent the selling price of iron will affect wages; but if, for instance, I get an order for 20,000 tons of rails, the price at which I take that order will not affect my wages at all.

10,187. You do not think that it would be a satisfactory system if your wages went up and down by a sliding scale according to the price at which you sold your bar?—No, because the men would always be in a state of ebullition and always dissatisfied. We look upon the question of wages as one of those questions which had better not be agitated, and it is our interest to bear a vast deal before we attempt to alter the rate of wages. Our alterations have been very few, sometimes they have been serious, but they have been very few, and we bear a vast deal, and are at this present time bearing a vast deal, because we do not wish to raise unpleasant questions.

10,188. (*Mr. Hughes.*) In that association of which you spoke, where the masters endeavoured to a certain extent to fix the question as to the reduction or increase of wages, did you bind yourself in any way one to another, or was it simply voluntary?—Yes. When we have acted together we have come to this sort of understanding: "The time has arrived when wages ought to go down, or when wages ought to go up;" (we have met for both purposes), "what shall it be?" One man says one thing and another man says another thing; then having discussed it, we say, "Is "it the understanding of those present that wages "shall be reduced, five per cent.?" it may be. Then there are some masters who want to point out how it shall be carried out, but we object to that, and I have always myself objected to it; we leave it that each master shall carry out the reduction in his own way, it being an honourable understanding that the reduction will be carried out.

10,189. You never carried it beyond an honourable understanding?—No.

10,190. Of course, without any remedy therefore against the person who broke it?—Not the least remedy.

10,191. As regards the Belgian trade, have you paid any attention to that?—No.

10,192. Do you happen to know what the amount of the Belgian iron trade is in the year?—No, not at all; I know that it interferes with us to a certain extent, but I am not much alarmed at it.

10,193. Do you think that foreign competition has seriously interfered with the iron trade of Great Britain in the last few years?—Whether actual foreign competition has I do not know, but the fear of it has, I am sure.

10,194. Are you aware what the returns of the Board of Trade for the years 1865 and 1866 were?—No; I do not attempt to put my observations any higher than a matter of opinion. I know that Belgium does undersell us occasionally.

10,195. Do you know whether it is or not the fact that the export of iron from England in 1866, according to the returns of the Board of Trade, was 2,000,000*l.* more than in 1865?—No, I do not happen to know that.

10,196. Do you know at all the system of the Belgian iron trade; do you know, for instance, whether the minerals belong to the state or not?—No. I have not been in Belgium since I was an ironmaster, and I have not had occasion to work the subject up.

10,197. With respect to your benefit societies, I think you say that they are now in a very flourishing state generally?—Well, I did not say that. I say that our workmen's funds are in a prosperous state, and I believe the benefit societies to be so, but I do not know it of my own knowledge.

10,198. Those in your works are supported simply by deductions of 2*d.* in the pound, are they not?—The workmen having settled that there shall be a stoppage of 2*d.* in the pound for the purposes of the benefit societies, authorize us to stop it, and, therefore, we stop it; and if any man refused to be stopped, we should say to him, "You shall not work here." That would be because the men wish it; but with respect to the stoppage for doctors and schools we do it because we wish it.

10,199. What benefits do you, as a benefit society, give to the men?—When they are sick they get an allowance.

10,200. Do they get any funeral allowance?—Yes, from general benefit societies. The Welshman like the Irishman likes to be buried decently.

10,201. Is there any allowance for accidents?—Yes, for any accident that disables a man from labour.

10,202. How long have these societies existed?—A long time, but they have developed of late years.

10,203. Is there any other subscription than the 2*d.* in the pound to the Dowlais fund?—No.

10,204. We have been told here both by actuaries and by other witnesses, that the subscriptions to the trades unions are utterly inadequate to carry out the objects for which they are established, which are exactly the objects which have been mentioned by you. Therefore, I wish to ask as to your benefit societies, which are not connected with trades unions at all, whether you have formed a subscription which is smaller than that of any of these trades unions, sufficient to fulfil those objects which are the purpose of your benefit societies as of theirs?—In the first place with us the relief given out of the fund ceases after a certain time. I cannot tell you at what time, but it does cease after a certain time. And it very often goes not to support a man wholly, but to support the man in aid of parish relief. There come before me at the Board of Guardians every week a certain number of men, and the relieving officer says, "I want so and so for that man temporarily. He is on the Dowlais fund." The Dowlais fund is given once a fortnight, and when a man who seeks parish relief is on the Dowlais fund the fund supports him practically one week and the parish another.

10,205. (*Earl of Lichfield.*) Are we not proceeding somewhat in the dark in this matter, because before we can draw any comparison we must ascertain what are the benefits provided by your society and this information we have not got before us?—Simply an allowance in the case of a man being out of work from illness or accident.

10,206. Everything depends upon the amount of that allowance?—That varies, not with what the man pays, but according to the condition of the fund.

10,207. (*Mr. Hughes.*) You have in your works two distinct funds. You have a school and medical fund, for which 2*d.* in the 1*l.* is stopped compulsorily, the accounts of which are kept entirely by themselves, and are never mixed up with the pure benefit society, for which also 2*d.* in the 1*l.* is stopped on the wages for certain benefits, funeral benefits, sick benefits, and accident benefits?—Funeral benefits belong to the benefit societies, but that is a sick fund only and not a funeral fund.

10,208. (*Earl of Lichfield.*) Will you explain to us a little more clearly what that arrangement is with regard to the payment from the parish, and under what circumstances that payment is made by the parish, whether the parish pays to your workmen an allowance when they are out of work?—When a man has claims upon the parish (the usual claims I mean, of course, they are the same with us as in any other parish), and comes before the board and tells us that he has a certain number of children, and has broken his leg, or is ill, we proceed to apply the usual rule to him. But the relieving officer says, "Instead of "giving the amount to him weekly, order it once a "fortnight, as he will be upon the Dowlais fund "next week."

10,209. (*Chairman.*) Outside of that 2*d.* fund you have the other benefit societies amongst you as well?—Yes, of which we know nothing, and of this we know very little, because we are particularly careful not to interfere. All we look to is to prevent it from being bankrupt.

10,210. (*Mr. Hughes.*) With respect to those two tables you have put in, I presume that the rate of wages there calculated is calculated upon six days a week?—Yes.

10,211. (*Mr. Mathews.*) I think you say that you make iron ore into pig iron?—Yes.

10,212. What are the quantities of iron you make?—We make 2,000 tons of rails and bars, and 200 tons of steel a week.

10,213. Do you know, speaking roughly, the amount of wages which you pay weekly?—About 7,700*l.* a week; at Dowlais that is.

10,214. You were asked a question about the Belgian iron; you believe a little in the actual result, but a good deal more in the apprehension as to the Belgian iron being against you in the market. They have superseded you in some cases, I think, in the large contracts on the continent, have they not?—Every now and then they crop up and cut us out.

10,215. They interfere with you in the Russian market?—I believe they do.

10,216. It has been before us frequently that there is a comparatively low rate of wages in Belgium as compared with the rate of wages in this country. Is that operation likely to decrease or increase, do you think?—I cannot tell you. There may be circumstances there that I know nothing about that may enable them to make cheaper iron.

10,217. You cannot speak as to what would be the operation of the Belgian ironmasters with a lower rate of wages, competing against the English ironmasters with a higher rate of wages?—You have to look at the physical circumstances.

10,218. At all events the fact exists that the Belgians are powerful competitors on the continent?—I can only say that the Belgians do interfere with us in the iron market, and now and then undersell us.

10,219. That used not to be the case?—No.

10,220. You were asked some questions about the relation that subsisted between the rise of wages and the price of iron. It was stated to us that in South Staffordshire when the price of iron fell, there was a necessity for reducing wages, and when the price of iron rose, the men demanded, and successfully, a rise in wages. That does not rule you in Wales?—It rules us of course, but not from moment to moment or from week to week in the sense in which I gather from what has been said, that it rules Staffordshire. But of course the price of rails, or the price of iron, for instance, over a whole year, in affecting all the Works will affect the rate of wages. But if I happen to get an order, what I receive for the order does not affect my rate of wages, because I cannot move alone.

10,221. Your business is generally founded upon large contracts from time to time for rails, is it not?—I am sorry to say that it is not so now.

10,222. You have taken, for instance, contracts occasionally for 40,000 tons at a time?—Yes; we are very happy to do so.

10,223. If the price in other districts were to fall during the course of the execution of that contract, if it were a beneficial contract, you would not feel it right and fair to immediately reduce your men?—If our men came to us and said, "Our neighbours are "getting higher wages—we really do not care what "you are getting for the contract—that is merely "profit and loss," we could not answer it, and it has happened not unfrequently that we have had heavy contracts and have lost because the rate of wages have gone up.

10,224. That is to say, though the contract was an unfavourable one, yet, if the wages were being advanced in other districts, the men would demand an advance from you?—I should not care to plead to the men the fact of a contract having been taken at a low price.

10,225. On the other hand, if wages in other districts were reduced while you had a favourable contract, would you not reduce your wages?—After a rise or a fall has continued for some time, of course it has a tendency to produce, and may produce an alteration in the rate of wages; but the alteration in the rate of wages does not follow immediately upon it either one way or the other.

10,226. But there being a variation in your wages of nearly 30 per cent. in the years mentioned in your table, would that indicate that the fluctuation of the rate of wages in the Dowlais works is pretty nearly

Mr. G. T. Clark.

8 Nov. 1867.

analogous to the fluctuation in Staffordshire?—I should think so, ultimately.

10,227. (*Mr. Harrison.*) But the fluctuations are not so frequent with you?—I should think not.

10,228. (*Mr. Mathews.*) There is a general vibration of wages with the price of iron all over England?—Yes.

10,229. (*Mr. Harrison.*) Do you mean a fluctuation in wages immediately consequent upon price?—No, not immediately.

10,230. Not three times in six months would wages be altered perhaps with you?—No. I think that that list which I have furnished gives the number of times that wages have been altered in the last 10 or 12 years.

10,231. (*Mr. Mathews.*) The only difference betwixt the operation of the rising and falling of wages in your works and in Staffordshire, is that they are not quite so frequent and sudden in your works?—I began by saying that I had not sufficient knowledge of Staffordshire to say that.

10,232. As to the employment of women, does the employment of women form a material element in the economy of your works?—Yes, I think it does.

10,233. What rate of pay do you give the women?—The women do a great deal of piling, and piling requires a good deal of skill, especially now. You put the ordinary quality of iron for the vertical part of the rail, but you put a superior quality of iron for the parts where the wheel is to come, and the women have to put in bars of a superior quality in particular places, and there is a certain amount of skill in that. I daresay a clever woman would get on in that work better than another.

10,234. Would a woman do as much as a man at the lower rate of wages that she receives?—No, you put a woman or a child to do work upon which a man would be thrown away.

10,235. The man's labour would not be usefully employed on that particular department?—No. The case of a door boy in a colliery is a very good instance; a boy can do that work, and if you were to put a man to do it the labour would be wasted.

10,236. You were asked about the health of the women labouring in the ironworks and upon the coal-pit bank. In point of health are they not the healthiest class of women you have got in Merthyr?—I must know something of the other classes of women to be able to answer that.

10,237. At all events are they a very healthy class?—I think so. We have had lately a great number of sanitary inquiries into the condition of Merthyr, and the Government have been doing us the honour of reporting upon us, and we happen to have a medical man in the district who is very great indeed upon the subject of statistics, and I have been assured by him, and by a very eminent medical man, the late surgeon of the Dowlais works, that strange as it may appear, the work done by the women did not shorten life, and did not affect health.

10,238. Do you think that if any legislative enactment were to operate in discharging these women from employment it would be considered a great hardship by them?—By them it would.

10,239. Is there any other occupation which they could take themselves to?—They must look after their houses and breed up their children.

10,240. If they were compelled to leave their present employment without any equivalent being found for them they would deem it a hardship?—It would be a most unpopular measure.

10,241. (*Mr. Roebuck.*) But I believe that excluding women from mines was unpopular among the very women excluded?—Yes I think so, and I think generally speaking that reforms of this character are most unpopular amongst those who are the subjects of them.

10,242. (*Mr. Mathews.*) As to emigration, is there much emigration going on from South Wales?—From time to time a good deal, at the present time not much.

10,243. In the event of skilled workmen emigrating to America, what means do you adopt of supplying their place?—Very often we do not adopt any means of supplying their place. We import an ignorant man, and he gives us a great deal of trouble.

10,244. Until he is educated?—And then he goes also.

10,245. The tendency of emigration is to cause abourers to be brought into the place of skilled workmen?—The tendency of emigration is to lower the class of labour and to limit the number of labourers.

10,246. (*Mr. Roebuck.*) Is not that gap which is made in emigration very much supplied by Irish immigration?—No; the place of the Irish emigrant is filled, no doubt, by an Irish immigrant, but the place of the skilled Welshman cannot be filled by an Irishman. The men we get for that purpose are men who have been bred up in the rural districts; they speak Welsh only, and they are not well informed men, whereas an ordinary Merthyr or Dowlais workman has his three or four copies of the "Times" in his reading room, and there is as much desire on their part to get the papers of the day as there would be in an ordinary club.

10,247. (*Chairman.*) Do these men speak Welsh in their own families?—Yes, they think in Welsh.

10,248. They use the two languages?—Yes, and that does not hurt them. We petitioned Mr. Lowe, I think, to give us a little advantage at the school examinations on the plea that our children had two languages to contend with, and the answer we got was in substance, "I have looked into the subject, and consulted "the inspectors and they say that the Welsh children "are quicker than the English." The double language brings them forward, in fact.

10,249. Has there been any attempt in your neighbourhood to extirpate the Welsh language, and to force the people in their own homes to speak in English?—No; but in our schools we never employ a master who does not speak English. We go for men to the best training schools, and take them without reference to their being Welshmen or Englishmen, all we stipulate is that they must speak English. But the consequence is that of a large number of school teachers I do not think we have half a dozen who can speak Welsh.

10,250. (*Mr. Roebuck.*) Has not the tendency of late years been that the speaking of Welsh has diminished and the speaking of English increased?—The speaking of English has increased, but I should rather doubt whether the speaking of Welsh has diminished. I have had occasion lately to look at some of the registers in the rural parishes in the Vale of Glamorgan, and I find that the Welsh element there has increased, and the Welsh are very frequently having their Eisteddfodau.

10,251. The increase of English is connected with an increase of persons reading English literature, I presume?—There is an enormous increase in the amount of English literature imported into Wales.

10,252. There is no Welsh literature to speak of, is there?—The modern Welsh literature is composed chiefly of translations from the English.

10,253. (*Mr. Booth.*) Do they at your schools teach English exclusively?—Yes.

13,254. (*Chairman.*) Do the dissenting ministers who have that great influence which you spoke of, worship in English or Welsh?—There are three small English chapels in the place, and all the rest are Welsh.

10,255. (*Earl of Lichfield.*) You say that a great number go out to America. Do you know many instances in which they have returned?—Yes, some few have returned greatly disgusted. But the large proportion remain.

10,256. Generally speaking, what class of labourers go out?—It is rather a skilled class that go out.

10,257. Have they remained?—I should say on the whole that probably there are more of the skilled class who return. I take it that the labourer who goes out,

if he finds that he does not like it, has not money to come back again.

10,258. (*Mr. Mathews.*) Have you any Mormons in Merthyr?—No, but I believe we have sent a good many out to America.

10,259. Do they ever come back?—No; or if they do it is with more civilized opinions.

The following tables were handed in by Mr. Clark:

WAGES IN 1866, AS AN AVERAGE YEAR.

Colliers		30*s.*	per week.
Miners		20*s.* to 25*s.*	„
Blast furnaces	Fillers	34*s.*	„
	Founders	40*s.* 3*d.*	„
Forges	Puddlers, 1st hand	33*s.* 7*d.*	„
	Do. underhand	16*s.* 10*d.*	„
	Shinglers	25*s.* 6*d.*	„
	Rougher	30*s.* 3*d.*	„
	Roller	33*s.*	„
Rail mills	Ballers, 1st heating	36*s.*	„
	Bloomers	36*s.* 6*d.*	„
	Baller, 2nd heating	51*s.* 9*d.*	„
	Rougher	56*s.*	„
	Roller	65*s.* 9*d.*	„
Labourers		12*s.* to 15*s.*	„

RISE AND FALL OF WAGES (See "Answers" given below.)

Fluctuations in Rate of Wages from the year 1848, putting the year 1848 at 100.

1848, November	100		
„ December	90	10 per cent.	reduction.
1850, January	85	7½ per cent.	do.
„ October	75	10 per cent.	do.
1852, do.	79	5 per cent.	advance.
„ December	83	5 per cent.	do.
1853, April	91	10 per cent.	do.
„ August	100	10 per cent.	do.
1855, April	90	10 per cent.	reduction.
„ October	100	11⅑ per cent.	advance.
1857, November	80	20 per cent.	reduction.
1861, August	72	10 per cent.	do.
1863, November	79	10 per cent.	advance. Puddlers advanced 15 per cent.
1864, March	87	10 per cent.	do. Puddlers advanced 10 per cent.
1865, January	78	10 per cent.	reduction.
1867, do.	71	10 per cent.	do. Colliers and Miners not reduced.

The witness withdrew.

The following questions were put to the witness in writing by Mr. Harrison. The answers are subjoined.

(1.) In Staffordshire a meeting of ironmasters is held quarterly, at which the selling price of iron is declared, and by a local rule introduced by Mr. Thorneycroft, the wages of the men throughout the works rise or fall thereon according to the selling price of the puddled bar *per ton* in the proportion of 1*s.* to 1*l.*; thus, (saving some trifling difference) when the puddled bar is at 10*l.* per ton the puddler's wages are 10*s.* per ton; when iron falls to 9*l.* per ton the wages are *ipso facto* reduced to 9*s.*; when the bar falls to 8*l.*, wages are 8*s.*; and so on, a reduction of 10 per cent. following throughout the works.

It is now stated that this is *absolutely* unavoidable, since the wages which so fluctuate form nearly the whole of the cost of the bar.

(*a.*) Is this a good system of regulating wages?

(*b.*) Is it essential that wages instantly fall on a reduction of selling price?

(*c.*) What proportion of the cost of the bar goes in payment of *weekly* wages paid *by the manufacturer?*

(2.) It is stated that the unions have paralyzed the iron manufacture by enforcing *uniformity* of wages irrespective of skill. Throughout the trade, unionism or not, puddling is paid per ton—the pig iron to be puddled being a measured quantity, and the yield measured.

In the Dowlais works, where there is no unionism, are puddlers working *identical* qualities of iron under identical circumstances paid one rate or different rates *per ton?*

ANSWERS.

Question I.—The Welsh iron trade has been conducted for many years without any attempt on the part of the masters to regulate the price of iron. The system has been one of free competition for business, each master being guided by his own judgment and necessities as to the iron he makes and the price he quotes. On the whole, the system has worked well, and in bad times like the present, the masters submit to heavy losses for the purpose of keeping their workpeople together, trusting to make up for these losses in better times.

Of the losses thus indicated the amount depends upon the spirit and wealth of the individual master, and those who carry on the largest trade suffer necessarily in bad times the heaviest amount of immediate loss.

Under this system the men have generally more regular work throughout bad times than in districts where a different system prevails.

The price of iron regulates the price of labour, because when trade is profitable labour is more in demand and therefore relatively scarce, but no attempt has ever been made in South Wales to regulate the price of labour by the actual selling price of finished iron at the time.

Question 'a.'—No. The system described in the question is not a good system for regulating wages, because it assumes, first, that the masters can fix the market price of finished iron, which they cannot; and further, that supposing the price to be fixed and *ascertained*, it cannot be determined what is the workman's fair share of that price. Like the master's profits the workman's share must depend upon ever-varying circumstances, and I do not think there is any method by which the proportions could be so determined as to be fair towards master and men, and to give satisfaction to both. The result of the working, or rather of the attempt to work, the system described seems to prove this. It has not, I understand, brought satisfaction or profit to the employers, and to judge from the continual agitation among the workmen in the district referred to, neither has it brought content to the employed.

Supply and demand must always affect the rate of wages irrespective of the price of the finished article, excepting indeed when the masters, as at present in Wales, are content to work at a heavy loss, for the purpose of keeping their men together. By thus refusing to take full advantage of a time when the supply of labour is greater than the demand, and retaining his full staff of workmen through bad times, the Welsh master expects to be in a position to take full advantage of the first move in his trade towards higher prices.

Question 'b.'—This question has already been answered. It is sufficient to observe that there are circumstances when the Welsh master thinks it advisable to maintain wages at a higher rate than is warranted by the market price of iron; that is, he thinks it, on the whole, better to make a loss than to reduce wages below the point at which his men can support themselves and their families in moderate comfort, and thus be driven to seek a livelihood elsewhere.

Question 'c.'—This proportion is ever varying, and must do so. In good times the proportion borne by the cost of labour to the selling price of the article of production is lower than in bad times. At this present time the cost of labour alone absorbs nearly all if not quite all the price of the finished article of manufacture.

Question II.—Various schemes have been tried for rewarding specially skilled workmen, whether puddlers or ballers, by paying a premium upon good work. The question is, however, surrounded with so many difficulties in practice, that attempts to make a special difference in the rate of wages in the iron trade have for the most part been abandoned, and the advantages enjoyed by the good workman are exhibited in a different manner. He is sure of steady employment, he is valued by his employer, and has the choice of the best furnaces, and, where there is a difference, he has the most convenient place in the forge for work. Moreover, he earns generally more money than those less skilled. A good and careful workman will produce a ton of puddled bars from 21½ cwt. to 22 cwt. of pigs, while a bad or careless workman will produce only 19 cwt. from the same quantity. The good workman, therefore, thus earns more wages than the bad one in the proportion of say 20 to 19. This, indeed, is no adequate measure of his value to the master, but it is very difficult, not to say impracticable, to recognize this value in a direct money payment, because if you put a premium on a good yield, that is, on good work, the temptation to the bad and dishonest workman to make up weight by unfair means is found to be too great to be resisted, and is very difficult to check. In the case of men working by the day, or wherever it is practicable with men working by the ton, they are paid in proportion to their skill.

Dowlais, December 1867

Mr. J. Brogden.

28 Nov. 1867.

Mr. JAMES BROGDEN examined.

10,260. (*Chairman.*) Do you manage some considerable iron and coal works in South Wales?—The Tondu Iron and Coal Works.

10,261. How long have you had the management of them?—14 years.

10,262. Could you say about how many men you pay on the pay night at those works?—I cannot say, because we have a number of men working under others. Perhaps every man that we have on our register—that is to say, on our books—represents three or four others.

10,263. (*Mr. Mathews.*) Could you tell roughly what amount you pay weekly for wages?—About 10,000*l.* a month.

10,264. Have you any unions of workmen in your district?—We have had unions, but they have principally disappeared. There was a union that existed among the puddlers more particularly, but it was broken up at a time when some little disturbance arose amongst themselves on the question of a reduction of wages. The delegate, a man who was in the habit of attending the meetings of delegates in all parts of the country, was stationed at our works, and he was the secretary of that particular union. He, however, left the works, took the books with him, and never accounted for the monies, and there has been no return made of it. Since then the union has broken up.

10,265. Was he a Welshman?—I do not know. He was secretary to the Ballers' Union.

10,266. Was he a paid delegate?—Yes.

10,267. So that the union ended in the paid delegate running away with their funds?—Yes; I believe he is now in the employment of the Great Western Railway.

10,268. (*Sir D. Gooch.*) He is not puddling there, is he?—I do not know what he is doing.

10,269. (*Mr. Mathews.*) Since the secretary of the union skedaddled (if I may use the term) you have had no union organization in your works?—No.

10,270. Do you consider the effects of unions to be beneficial or otherwise?—I take it that they would be good as regards the management of the men themselves, provided they were not applied to the management of other trades and to men in other works.

10,271. That is to say, you would not object to unions being formed in your works provided they confined themselves strictly to themselves, and did not extend to men not in the union?—So long as they were confined to making terms with the masters, or conferring with them upon any subject, I think they would be beneficial.

10,272. That is to say, a union in each particular works?—Yes, or of any particular class of workmen.

10,273. But you would object to the importation of men from other districts or other unions into your own?—Yes.

10,274. In the event of a discussion on wages or any other subject you would object to any other men except those in your immediate employ forming part of a deputation to you?—Quite so.

10,275. You would not like to discuss wages and so on with any other men except those in your immediate employ?—Just so, or those with whom I have to deal.

10,276. What system do you adopt in regulating your wages? Do you adopt the same system as is prevalent in South Staffordshire of altering the rate of wages according to the rise and fall of the price of iron?—I think that Mr. Clark spoke very clearly on that subject when he told you that the ironmasters in South Wales have a conference on the rate of wages which they can afford to pay, and that then having come to a general resolution a reduction or rise in the wages would occur to the same extent, generally speaking.

10,277. That is to say, the principle which regulates wages with you is in the main the selling price of iron?—Yes.

10,278. If the price of iron were to rise in other districts, it would necessarily rise in Wales, would it not?—Yes.

10,279. And then you generally advance the rate of wages?—Yes.

10,280. If, on the other hand, the price of iron falls in other districts, it immediately influences the price of iron in Wales, and then you think it necessary to reduce wages?—We do. We have done it generally as a body of ironmasters in South Wales—that is to say, if one has given a rise the whole body has given it at the same time.

10,281. Although in Wales that operation is not so rapid and immediate as it may be in the other districts, yet in the main the rate of wages is regulated by the price of iron?—Yes.

10,282. Have you turned your attention to the question to what extent the cost of labour enters into the price of a ton of bar iron?—I must say that that is a very complicated question and requires a good deal of working out, though I will not say that it is impossible to get at it. In the first place you begin with the ironstone, which is got by labour. There are general charges and expenses upon that, in the way of timber and royalties, which form no item in the labour question. Then as to coal, when the coal is made into the produce of coke there is a certain amount of labour. Then in the manufacture of the ironstone into pig iron, there is a certain amount of loss of material, or as it is termed in ironworks, yield, so that the amount of the labour which has arisen upon the various items which I have mentioned is increased by the loss in the shape of yield. Then there will be the expense of the manufacturing of that iron again and the loss of the labour in the yield. It is a question which is complicated, but it could easily be worked out.

10,283. Taking a general view of the question, assuming the price of bar iron to be 6*l.* 10*s.* 0*d.* as a rough guess, what proportion of that would be constituted by dead charges that you could not alter either one way or the other, and what proportion by labour that you could alter either one way or the other?—To my mind five-sixths is a large average, and rather more than the actual figure. I have never worked it out, but I should take it to be so.

10,284. In the event of bar iron being reduced 20*s.* a ton, it is absolutely necessary, is it not, that the rate of wages in all the departments should be reduced in something like the same proportion?—Yes.

10,285. Your establishment consists of a simple estate. From that estate you raise a certain quantity of ore which you convert into pig iron, and that again you convert into rails or bar iron?—Yes.

10,286. So that in your case the whole of the cost of a ton of bar iron, exclusive of royalties and other small charges, on which no variation of price arises, consists of labour?—Yes.

10,287. And that you consider to be five-sixths of the cost of a ton of iron?—Yes, there or thereabouts.

10,288. Calling your attention again to the question of unions, whenever you have any dispute or discussion with your men, I suppose that if they are union questions you refer them to your agents, and that if they are material questions you take the charge of them yourself?—Yes.

10,289. You always prefer to deal with the men who work in your own employ, rather than with any other functionaries employed generally as what are called agents to unions?—For many reasons. In the first place, I take it that men who have anything to lay before you, understand the question which they come to speak about, whereas in nine cases out of ten the men who come to represent them do not. Besides the men themselves have a personal interest in settling the thing as well as the master, and as the result of my experience, during the time that I have been in my

present position, I find that when the men who are working for me have come to me in a reasonable way, and stated their case just as we do in making a bargain for buying or selling anything, we have been able to agree with them on some reasonable terms. We have some men who have been 24 years in the service of the firm, and indeed through the greater part of our works the men have been stationary; that shows, I think, that the operation of that system is successful.

10,290. So that in the event of any difference arising there is a friendly discussion between yourself and the men?—As a general rule it is so; but I may state a case which is occurring at this very moment, and is disturbing the peace in our own county. We have taken from the government a large tract of land belonging to the Duchy of Lancaster on the understanding that we should make a railway, and open a communication into a maiden part of Wales and with Porthcawl. There was no obligation with regard to the port, but the railway communication was obligatory. That we have opened, but in so doing of course the conveyance of material into a maiden district was exceedingly difficult and costly. Most of the materials had to be conveyed to the mines and the upper portion of the railway on mules' backs. For the labour we had to get people from all parts; we took any who would come and put them into huts and various dwelling houses, wherever we could locate them for the time being, and we were of course obliged to pay a very high rate of wages in order to induce them to live in an uncivilized part of the country. Now when the communication is complete of course a readjustment is necessary, and with reference to the readjusting of that state of things the question was brought before me how we should carry out the mines. I had laid before me several means of doing it, and amongst the rest those which are usually carried out in the Rhonda Valley, and in those works which are worked upon the north country system. My brother and myself had a very long discussion and an anxious one upon this subject, and we came to the conclusion that the system applied in the north country was a superior one to that which applies in South Wales, and that the coal could be worked upon it at a much less cost. With this view we put a mineral agent over one colliery at the head of the valley, who was to carry out the north country system, stopping the stone work or dead work in the headings. To make the horse height for working in the coal we are obliged to take up a portion of the stone, or else to take the roof down. This is a very costly operation, and in order to avoid the dead work for taking up this stone we made use of a kind of waggon which is not usually made use of in South Wales, but which is used in the north, (though this is of a smaller kind,) thereby giving the collier the advantage of getting his coal into the waggon immediately as he cuts it, without any further labour whatever; that is to say, instead of pushing the coal for 60 yards along the corridor of the mine, he had the opportunity of having the waggon taken to the place where he was working, so that he could put his coal without any further trouble into the waggon at once. That was a great advantage to him, and therefore the price paid for the same coal in another valley had no reference at all to the work which we required. We found some difficulty in dealing with the men, inasmuch as the moment we altered the system, those men who had been making large sums of money for cutting up the stone work refused to continue unless they had the headings or driftways carried in on the same terms and in the same way as before. I told them that it was unusual in colliery works for the master to have dictation from the men as to how he should carry on the work, so long as it was carried on safely. A deputation waited upon me, representing that the manner in which we were going to work the coal would be unsafe. My reply was that their places were safe, and that the system upon which we were going to work was one carried out and sanctioned by some of the best engineers; that it would take a little time to try, and that perhaps they would go to their work on the same terms and in the same way as before, with the exception of those men working upon the headings. The men immediately turned out, and there was a dictation as to the way in which they should work and whom I should employ. I declined to submit to this, and I said, "I wish to make a fair arrangement, and "in so doing I am perfectly willing to adopt the "agreement current in the north." I did so, and I got from the north of England, after some trouble, the terms upon which they hire their men, and gave my men the opportunity of hiring themselves for six months upon terms which we should agree upon. They agreed and signed a book for a six months' bond and went to work. Another colliery in the valley was to be placed upon the same terms, and some of the men signed the articles of the bond and went to work, some 14 of them. On Monday last, much to my astonishment, when the men were quietly at work, I was advised by telegraph that a thousand men were on the hills armed with sticks and staves, coming to prevent these men from working, and on Tuesday the multitude had increased to 1,500 men. I went up myself and told my men that I had nothing to do with such a disturbance, but that I should place their safety in the hands of the civil authorities (all our other portions of work are going on peaceably); that they were quietly to go to work and not submit to the dictation of these other men. I asked who they were and where they came from. They came, I found, from various collieries having no connexion with the matter, either with regard to the coal or with regard to the price, or anything else, and I believe myself that they are connected with various trades unions in the district. They had a meeting and summoned the men who were at work to attend. About 30 men came to their houses threatening that unless they accompanied them they would do something for them. The men replied that they would go or not as they chose. They went, however, and they were put into a club room with an organized company, and a chairman, and several speakers and witnesses, and they were examined as to the prices they were receiving. They were told that they were blacklegs and turncoats, and all the rest of it, but they said that they were not, that they were getting the same prices as the men at the other collieries, and that they were perfectly content with the wage which they were obtaining; they could obtain, they said, 5*s.* and more per day, and they had no quarrel with their masters, but were perfectly satisfied with them.

10,291. Then I suppose your workmen, of whom you are now speaking, were not in the union?—These men were not in the union.

10,292. And this circumstance was incident to the operation of the unions in the neighbourhood who chose to interfere?—Yes; I took down some notes from the statements of the men who were taken into the meeting, and it appears from what their deposition says that they had been connected with the union, or rather one of them had been connected with the union, for on the chairman saying to him that he was working under the price, he said, "No, I am not. I have been "with you long enough. I have had enough to do "with you. I have got my family to keep, and I "cannot afford to be idle." He said that to the chairman of this meeting, and I take it that that is a proof that there must be a union in the district. Those men, I believe, came from near Pont-y-prydd.

10,293. Can you tell me whether there were any paid agents of the unions among this assembly?—The time has been so short, and events so stirring, that I must say we have had no time to inquire into the thing for we have been surrounded by a thousand men armed with sticks and staves. The meeting was at night, and the chairman addressed the men at the meeting in the way that I have detailed. A sort of examination took place in which the men say that they had not a fair treatment, that they were not allowed to speak, and that the witness gave them the lie at once, without hearing their statement. There were several

Mr. J. Brogden.

28 Nov. 1867.

speakers who used threatening language, one of whom is said to have made the remark that it would be better for them not to go to work, as things might be serious afterwards, or something to that effect. The chairman holding in his hand a stick said, "Now, my "men, do you want to go to work or not?" They said, "We will please ourselves about it, we have "nothing to disagree about, and we shall please our- "selves." "Do you intend to go or not?" he said, and then holding his hand out in this way (*describing it*), he said, "We have brought a little rod this time, "but the next time we will bring a greater one," and he went on, "My good fellows, I advise you not to go "to work, or else it will be worse for you." The name of that chairman I have not yet ascertained, but I think that language such as he used would convict him.

10,294. He spoke as the chairman of the union, not as an individual, I suppose?—As the chairman of that meeting.

10,295. And that meeting, you said, consisted mainly of people belonging to unions in the neighbourhood?—I should say so. I cannot say that as a fact, because the time has been so short and the events so stirring that I have had no time for inquiry.

10,296. (*Mr. Booth.*) You see no reason to doubt that they were people belonging to several unions?—I think that their coming from various valleys shows that. For instance, they came from the South Wales mineral district in a body. I saw Mr. Baxter, of the firm of Messrs. Baxter, Rose, & Norton, last night, and he said, "I am astonished to find that our workmen "are all over your district." The men I have been speaking of were ordered to attend a meeting the next morning at 8 o'clock at the same place, the Blandy Arms. They declined to go, and while I was present three men armed with sticks came round to the cottages, telling them that they were to pick up their things and come with them in 20 minutes. Hearing of this I went down, met the three men and asked them what they wanted, what their names were, and so on. They gave me fictitious names, but while I was speaking to them the head of the police came up, and hearing what they had done took them into custody, but released them on bail. The moment that they were seized by the policeman the whole of the meeting came *en masse* to release them, running furiously, and I have no doubt that damage would have occurred if the head of the police had not let them out on bail or on their own recognizances to appear at Bridgend on Saturday. I heard by telegraph yesterday that matters remained much in the same way. But I have a letter from our people to-day which I will read if you will allow me. "All was "peaceable up the valley until about 12 o'clock to-day, "when a number of the men went to a house at "Blaenger, where a young man was lodging (who was "working at Tynewdd), and demanded to see him. "They said that he was a turncoat and that they "would rip his bloody heart out. They forced their "way into the house and ill-treated the man very much, "but fortunately by some means or other he made his "escape from them, or it is supposed they would have "killed him. Mr. Saddler" (the superintendent of police of whom I spoke) "and his staff appre- "hended a man who was there and brought him to "the public-house at Nantdyres, and Mr. Saddler "examined him, but in doing so the evidence broke "down, and he found that he could not legally detain "him, so he let him go. Since then we have got a "report that Vaughan Davis" (one of the leaders, it appears) "was the person who broke into the house "and ill-treated the man. I hope this will prove true, "as you are aware that he is one of the ringleaders, "and is still living in one of the Tynewdd cottages, "so there will not be much trouble in apprehending "him. There are not near so many strangers there "to-day as yesterday. All other places are going on "in their usual way." All our other works are as quiet as possible.

10,297. (*Mr. Hughes.*) You have been asked whether you have any reason to doubt that those men were union men; have you any reason to know that they were union men?—The time I say has been very short, but I have reason to believe that they were from this fact, that unless they were connected with some union they would scarcely have been able to muster such a force as appeared on those hills. Again, I am led to think so by an expression which fell from the chairman during the examination of those men, and which came to my knowledge, complaining of the men in one of the collieries working too much—working above the stint work.

10,298. (*Sir D. Gooch.*) What is stint work?—Stint work is the limitation of the work.

10,299. (*Mr. Mathews.*) What is called the stint constitutes a certain area that the men execute for a day's work?—Yes.

10,300. A man can do from one to two stints a day, according to his capacity, can he not?—Not in our district; the stint is the total day's work.

10,301. (*Sir D. Gooch.*) In cwts. of coal?—In cwts. of coal. In fact it was said that they were turning out 1 cwt. of coal more than they ought to do.

10,302. (*Mr. Hughes.*) You have a system of stints in your own works, have you not?—Do you refer to the colliers or miners?

10,303. I ask it in the broadest possible way?—No, I do not think that we have any limitation whatever in any part.

10,304. Do you say that there can be no system of stints except where there is a trade union?—I think not.

10,305. (*Mr. Roebuck.*) That is to say, the masters never stint or limit the men as to what they can do?—The masters never limit the men.

10,306. Then if there be any stint in your works it has not been your doing?—No.

10,307. If there be any stint in your works it must have been somebody else's doing?—Yes.

10,308. And you believe that that somebody else is the trades' union?—Yes.

10,309. (*Mr. Hughes.*) Have you any further reason than you have stated for believing that these men were union men?—No.

10,310. (*Sir D. Gooch.*) Do you know much of the district of Pont-y-prydd?—Not much.

10,311. Do you know that trades unions exist there?—I have heard so.

10,312. And that that limitation prevails there?—It does, and I believe the chairman of that meeting to which I referred came from that district, and therefore it seems to me that anyone knowing that trades unions exist in that part, that the chairman came from that district, and that he mentioned such a circumstance as stint work, would be led to the conclusion that it must have had some connexion with trades unions.

10,313. (*Mr. Hughes.*) But there is no organization in your immediate neighbourhood in connexion with trades unions, as I understand you?—Not in my immediate neighbourhood, but in several of the valleys there is. The Ogmore Valley is one adjoining the Pont-y-prydd, therefore in that district we more nearly approach them

10,314. (*Mr. Roebuck.*) Do you think that there would be any difficulty in identifying that chairman?—I think that by-and-by he will be found out. I think that it would be a very useful thing if an inquiry was made into this matter now while it is fresh.

10,315. (*Mr. Mathews.*) Will you ascertain whether this man who acted as chairman in the dispute belonged to any union in the district and let our secretary know?—I feel that the difficulties in making an inquiry under the present circumstances will be very great, inasmuch as everybody is guarded since these excesses have occurred, and that unless some one were commissioned with authority to compel them to give evidence it would be almost futile.

10,316. All you can say is that you have a strong impression that these men acted as the organ of a union in the neighbourhood?—I think so.

10,317. (*Mr. Harrison.*) Why should not the law

and the police of the district be put in operation to deal with this; is there anything to prevent that?—The police of course will do all they can, but the whole available force that could be assembled amongst the constabulary were, I think, eight policemen.

10,318. (*Mr. Hughes.*) Has the effect of this movement been to stop your works?—Entirely that portion of them.

10,319. (*Mr. Roebuck.*) Was that club chiefly composed of Welshmen?—I believe that there were Englishmen there; I know of one Englishman concerned in it.

10,320. Were there any Irishmen?—I should say not, but I do not know.

10,321. (*Sir D. Gooch.*) The stint work means this, does it not, that probably nearly the lowest amount of coal that a man can raise to the surface is the amount that is fixed upon as the limit of the quantity for all men to raise?—I take it that it is scarcely regulated upon those terms. I think that it is regulated upon the question of how much will enable a man to keep himself and his family.

10,322. Upon the laziest man who lives from hand to mouth?—Yes.

10,323. (*Mr. Mathews.*) Do you know the area which a man cuts for his day's work?—I do not know that; it is the weight with us, generally speaking.

10,324. If a man were left unfettered, and exercised the amount of skill and strength that he was capable of exercising, he could do more than one day's work of this stint; he could do two stints probably?—If the men were left to themselves they would do more.

10,325. If controlled by the union, the union confines them to the stint and says that they shall not do more?—I think that is the case.

10,326. (*Mr. Harrison.*) But have you positive personal knowledge that the unions, and if so what unions, have laid down and enforced this rule as to the stint?—I do not think that in our district they have applied it to any extent. I think that we have been happily free from it. I take it that we are now beginning to suffer from the system of trades unions which is in force, I believe at Pont-y-prydd and in that valley.

10,327. What is the rule as to the stint, have you seen it stated anywhere?—I have not seen it in print, but I have heard it stated that a certain weight, according to the character of the vein of coal they work, shall be produced, or that if a man produces so much more than a certain weight one day the next day he shall produce so much less.

10,328. In what union have you heard of that rule?—That I cannot say.

10,329. Have you ever heard of workmen amongst themselves choosing to enforce such a rule quite apart from any regular organization or union?—Not in our part. I do not know that we have had the stint in our own works to any extent at all events.

10,330. (*Mr. Hughes.*) Do you know what is the generally alleged reason for the stint rule?—There are a great many. The object is of course that the usual rate of wages shall prevail, and that the good workman shall be no better off than his fellow men.

10,331. But is it not also the object of the men to limit the amount which the master can keep at the mouth of the pit in store?—That would not apply to our case.

10,332. Do you know whether or not it is the fact that the men believe that a large accumulation of coal at the mouth of the pit enables the master to control wages more than he otherwise would?—I believe that that is the general feeling, but with regard to ourselves (and I believe it is the case throughout South Wales) we cannot afford to stock our coal.

10,333. (*Mr. Mathews.*) Is it not the fact that any attempt of that sort would be perfectly futile, inasmuch as the demand on your works is so large that it would be impossible to keep any large quantity on your pit banks?—The difficulty arises from the fact that the coal depreciates in value on being stocked, and that in such depreciation the profit is lost, and that consequently it would be much better for us to stop our colliery than work it in that way.

10,334. About the employment of women, have you any large number of women employed in your works?—We have not a large number, we have a few comparatively speaking.

10,335. In collieries or in ironworks?—We have none in collieries.

10,336. Of course you cannot employ them in the pits because that is prohibited by the law?—We have them employed in light work upon the pit banks.

10,337. What is the physical condition of those women that are employed on the pit bank?—They all appear to me to be very healthy and well to do and happy and smiling.

10,338. And generally speaking very good looking?—I cannot say that.

10,339. What is their rate of wages?—They have from 1*s.* to 1*s.* 6*d.* and even 2*s.* a day.

10,340. And they work six days a week?—Yes.

10,341. So that the average rate of wages is from 6*s.* to 9*s.* a week?—Yes, I should say so.

10,342. If any legislative arrangement were to take place to exclude those women from employment would they feel that a great hardship, or would they be able to go into service?—I think that they feel themselves much more free than if they went to service. It has come to my knowledge that they have declined service when offered to them.

10,343. Would it be possible to find domestic service for the large number of women who would be excluded from employment about the collieries?—I take it that wherever there is a healthy employment, and one not derogatory to the character of women, it is a positive benefit to society for women to be engaged in it.

10,344. (*Mr. Roebuck.*) What sort of work do they do?—They pick out the rubbish from the coal, oil the trams and hook the trains, and so on.

10,345. Are they exposed to the weather in that work?—They are in some places.

10,346. (*Mr. Harrison.*) Are they dressed in boys' clothes?—No, they are dressed in ordinary petticoats, without crinoline.

10,347. They do not wear men's clothes in any case?—No, not in our district.

10,348. Are you aware that they do in many districts?—Yes. I do not mean to say that with us they do not wear breeches sometimes.

10,349. (*Mr. Hughes.*) You say that any work that is not derogatory to the character of women is advantageous for them; do you consider this work derogatory to the character of women?—I think that they are better off than those not employed at all.

10,350. (*Mr. Mathews.*) What is their comparative morality; do you think them less moral than other women in their class of life?—I do not think so.

10,351. (*Mr. Booth.*) They do not lose caste in their own neighbourhood by working in this way?—No.

10,352. (*Mr. Roebuck.*) Have you seen women in England working in the turnip fields in England?—Yes.

10,353. Are they better or worse off than these women you speak of?—Not so well off. We have a large farm and frequently employ women in some of the classes of labour, and I should say that those employed on the pits bank are superior. The employment of women in ironworks becomes a very different question. I think where they are employed at night it is a different thing altogether.

10,354. (*Earl of Lichfield.*) Women in Wales are much more frequently employed in all kinds of employments than they are in any part of this country, is not that so?—I do not think that Wales would at all compare with the Lancashire cotton districts in that respect.

10,355. (*Mr. Roebuck.*) Do you think that the condition of the women employed at the collieries is a

Mr. J. Brogden.

28 Nov. 1867.

better condition than that of the women employed in cotton works at Manchester?—I do not think it is.

10,356. The women employed in the cotton works at Manchester are all employed under cover, are they not?—Yes.

10,357. And it is not hard labour?—I cannot say that the usual practice in Wales is to give the women hard labour. I do not think that we have a case where a woman has very hard labour.

10,358. (*Mr. Mathews.*) Have you had any opportunity of making any comparisons of the two classes of the women employed in the factories and those employed on collieries?—I had three years' experience in one of the largest cotton mills in England, which belonged to our family and was unfortunately burnt down, and I had experience with regard to that particular class, and I may say that of the two classes those employed on collieries, so far as my knowledge goes, are far more healthy than those employed in the cotton mills. At the same time I do not think that there is the same intelligence amongst those employed in the collieries as there is amongst those employed in the cotton mills.

10,359. You say that they are far more healthy; probably, therefore, they are more happy?—Probably.

10,360. (*Mr. Roebuck.*) What rate of wages do those women get that work on the pit's bank?—From 1*s.* up to 1*s.* 6*d.*, and even 2*s.* a day.

10,361. Will you tell me from your own experience what women get at the cotton factories?—I have known them get from 8*s.* up to even 15*s.* a week.

10,362. Then the wages do not materially differ in the one case from the other?—I take it that they are much the same.

10,363. Excepting that the women employed in factory work are under cover and are always warm?—Yes, but I do not think it follows from that that they should be always healthy. I do not think that it is the fact.

10,364. But I suppose you know that one mode of estimating the civilization or barbarity of a people is the mode in which their women are treated?—I think that is so.

10,365. And one of the modes that are thought improper and bad is employing women in a manner that tends to degrade them and injure their health, and that entails on them hard labour?—Yes.

10,366. Is not that operation which you speak of on the pit's bank rather a man's work than a woman's work?—I say, to begin with, that we place no women to do work which involves hard labour and which is men's work, but we make a very clear distinction between the two. We place a woman to light work which alone she is capable of doing, and pay her accordingly.

10,367. (*Mr. Hughes.*) Do you let women pile?—Yes; but, as I said before, their employment in ironworks, where they are obliged to work at night, I should like to see altered.

10,368. Is piling in your judgment work for a man or for a woman?—If you ask me whether a woman is capable of working at that without injury to herself I should say that up to a certain extent she would be able to do better than a man. I think, generally speaking, we shall all give ladies the credit of having more aptitude, quickness, and neatness, and the system of piling is essentially that kind of work.

10,369. (*Mr. Mathews.*) Is the occupation of women both on the pits bank and in the ironworks of that nature, that it would be thrown away if men's labour were applied to it?—I think it would.

10,370. The men's labour would cost more and would in a great measure be thrown away on work of that light nature?—I think to that extent; but with regard to ironworks where there are a number of people employed, and who can always get out of sight, and women are obliged to work at night, I certainly confess that I should rather see them not employed in that way.

10,371. Then the only objection which you have to the labour of women, would apply to women who are engaged in night work in the ironworks?—Yes, I feel that.

10,372. (*Mr. Harrison.*) Are women employed in the ironworks in Yorkshire?—I think they are.

10,373. Still there are some works that are carried on without the work of women there, are there not?—I do not know much of that district.

10,374. Do you believe that women are employed in all ironworks?—I could not answer that question.

10,375. Because if it be the case that in some works they manage without them, there can be no necessity for the employment of women?—I do not mean to say that they cannot be done without.

10,376. It is a question of cost I suppose?—I think beyond that it is a question of advisability. I take it as a principle, that whenever you can find employment for women, it is an advantage to the country and a boon to themselves.

10,377. Do you think then that this employment of women, if it does not exist in Staffordshire and Yorkshire, might be a benefit if introduced there?—So far as working on the pit's bank goes, I think so.

10,378. Do you know that the coal workers' unions have made systematic and organized efforts to abolish the working of women on the pit's bank in Lancashire?—Yes, I believe they have, but I have not much to do with that.

10,379. You know probably that they are in the habit of working there, and also in certain parts of Yorkshire, in men's clothes?—Yes, I have seen them. I cannot help thinking that the employment of women in the operations I speak of cannot be more derogatory to them than the working upon the mines and the timber as they do in Cornwall.

10,380. (*Chairman.*) I understand from you that there is a difficulty in finding employment for women, that there are a great many women who are capable of being usefully employed in the way you describe, and who cannot find other employment?—Clearly so.

10,381. I suppose that is within the observation of every looker on in human life?—It is the fact.

10,382. (*Mr. Booth.*) Do you think that, speaking of your neighbourhood and your own experience, the question as to what way women might be properly employed in might reasonably be left to the judgment of the employers?—I quite think so with regard to the working on the surface, not in the mines.

10,383. You do not think any new legislation necessary in that respect?—I do not at all.

10,384. (*Mr. Hughes.*) Have you any association of masters in your district?—We have no association of masters further than that which Mr. Clark described. The ironmasters in case of a reduction of the price of iron meet together and confer as to the advisability of reducing it a certain rate per cent., in accordance with the rates in other parts of the country.

10,385. And they act upon it?—They act upon it.

10,386. Each in his own works?—Each in his own works.

10,387. If you approve of that, how do you distinguish that from the supposed action of the men in unions, who meet from different works to settle what rate of wages they will take, and then in each works enforce it upon their masters if they can?—In the one case the way is perfectly free, that is to say, there is no compulsion upon the master that he shall reduce, and no penalty if he does not.

10,388. We heard something of a penalty of 500*l.*?—That was 20 years ago.

10,389. Still you think it perfectly fair that masters should meet to settle the rate of wages which shall be enforced at 20 different works, and that the men belonging to those 20 different works would only be doing mischief if they met to settle the rate of wages on their part?—I do not state it so. I say that it is advisable for the men to be perfectly free in the same way as the masters, but that what I do contend is wrong is that either men or masters should combine to oppress one another.

10,390. But combination to settle the rate of wages

is what I am speaking about and not oppression. 20 masters, say, meet and settle the rate of wages which each of them shall give, and they all feel bound in honour to enforce in their own works that rate of wages, and a master who does not enforce it is considered as having broken his promise?—No, I think you are taking the case rather as granted. In going to the meeting we only go to confer upon the advisability of such a step, and it is quite within the power of anyone of the meeting to say, "I will not agree to it."

10,391. Is it the fact, as Mr. Clark said, that in the association there was a case in this last year in which one master broke the agreement as to the rate of wages which Mr. Clark said was the reason why he did not wish the meeting continued?—I know the case alluded to, and I do not agree with Mr. Clark in his statement of it.

10,392. Do you mean to say that you do not endeavour to settle the rate of wages at those meetings?—Of course, I know we do. We try to settle on a principle; that is to say, supposing that the rate of wages has ruled throughout the district for certain prices, then in the case of a reduction of wages occurring throughout any other district, in Staffordshire, or in Scotland, or in Middlesbro', we find that it is advisable for our district also to reduce, we meet together to confer upon the advisibility of reducing wages or reducing our manufacture so as to reduce the quantity made, and thereby increase the price. If it is thought advisable that instead of reducing our manufacture we should give the workmen full employment, but a little lower rate of wages, so as to enable the masters to meet the times, then we try to carry that out upon the principle that so much per cent. shall be reduced. But we are not bound by anything that is determined upon.

10,393. Except for moral suasion or anything else you please to call it. You would think a fellow a shabby fellow if he did not keep to his agreement?—Of course, I should hold any man bound by his agreement, but as to what is agreed upon at this meeting I know it was said by one person, "I cannot do it because I have a certain contract that I cannot fulfil "if I do it;" therefore it is not binding.

10,394. (*Mr. Mathews.*) The ironmasters do not attempt to exercise any other than a social influence over one another?—It is not binding.

10,395. If a man does not act upon his compact they let him go his own way?—Yes, that is so.

10,396. (*Mr. Hughes.*) Would you remonstrate with him?—I do not know that we have ever done that.

10,397. (*Mr. Harrison.*) Do you think that to call a man a shabby fellow would bring a person within the combination laws and would be a case of intimidation?—I do not know.

10,398. (*Earl of Lichfield.*) Do you know any instance in which one of the members of your association has been called a shabby fellow by another?—I do not know that I could put it exactly in that way, but I know that things of that sort can be said.

10,399. (*Mr. Hughes.*) Assuming for the moment that the men's unions stop short of physical violence in carrying out their resolutions as to wages which they arrive at in combination, how do you distinguish their union from yours?—I think that in the one case supposing all the ironmasters in South Wales came to a certain agreement and one individual was a delinquent, or supposed delinquent, and they went to his house for the purpose of conferring with him, or remonstrating with him, it would hardly be held by anyone that they went there for the purpose of intimidation, but in such a case as I have quoted to-day where men meet in such numbers armed in the way I have described, there is very strong evidence, I think, of intimidation.

10,400. (*Mr. Harrison.*) But you do not connect it with the union?—I do connect it with the union.

10,401. (*Chairman.*) I understand you to say that if masters meet together and get information and advise each other upon the terms upon which they can conduct their business you think that proper?—Yes.

10,402. If workmen meet together and advise each other upon the terms on which they can conduct their business you think that proper?—Yes.

10,403. If either tries to intimidate or hurt the other you do not think that right?—Just so. Perhaps I may be allowed to suggest that in dealing with the cases of the workmen in regard to the particular occasions of strikes and so on, it would be a great advantage if those cases were referred to the stipendiary magistrate so far as could be, because I think that with the practice he has, which is very much more extensive than the local magistrates have, he is more competent to deal with them.

10,404. (*Chairman.*) Are you in the Merthyr district?—No.

10,405. A reference has been made to-day to the stipendiary magistrate in the Merthyr district, do you know him?—Yes, that is Mr. Fowler.

10,406. (*Earl of Lichfield.*) What sort of cases do you refer to?—Cases of intimidation.

10,407. (*Mr. Booth.*) Would they not all be so referred if there were a stipendiary magistrate in the neighbourhood?—We are out of his district, therefore our cases would go to the local magistrate. I think if the law would extend so far as to permit us to take such cases to the nearest stipendiary magistrate it would be an advantage.

10,408. (*Mr. Harrison.*) As to that one particular class of case you think there should be an exception?—Yes, because the law upon the subject appears to be very indistinct.

10,409. (*Mr. Hughes.*) Have you attended to the question of the extent of the general iron trade throughout the country, and the question of foreign competition?—No, I have not with regard to the quantities of the iron. I am not conversant with the figures and statistics, but I know that foreign competition has interfered with the price of iron very much indeed, and I have found that the contracts which we have had offered to us have been taken up in the Belgian market for bar iron more particularly.

10,410. Have you known in your own case that contracts you have tendered for have gone to Belgium?—Yes, I can give time, and place, and everything.

10,411. (*Chairman.*) Of more than one case?—I can give more than one, I know that in one case we had a contract offered to us for bar iron delivered in London and the contract was taken by a Belgian house to supply bar iron delivered into London at a lower price than we could take it at. Before leaving I wish to add this—I do not know whether the Commissioners will permit a special inquiry into the case which I have brought before them to day to be made in the country. I believe the Trades Union Act gives them the power of appointing a special commission to inquire into the facts.

(*Chairman.*) We will take the matter into consideration.

The witness withdrew.

Mr. Frederick Smith examined.

10,412. (*Chairman.*) You are manager of Lord Dudley's works?—I am the general manager of all Lord Dudley's mining estates in Staffordshire and Worcestershire.

10,413. They are, as we know, very large works. I will ask you the number of men employed by the week, or the sum paid by the week?—According to good or bad times, they will range from 6,000 to 8,000 men.

10,414. Has the rate of wages borne a proportion to the price of iron in the South Staffordshire district, so that they shall be something in the nature of a sliding scale?—Yes. But I have to deal with not

Mr. F. Smith.
28 Nov. 1867.

only iron, but coal to a very much larger extent, and limestone, and fireclay also.

10,415. The proportion of wages to the price of iron is a thing which adjusts itself, but that does not apply, as I understand you, to coal and limestone?—Whenever iron goes up the price of wages goes up also; but during the last 10 years that sliding scale has altered very much in favour of the men. The men have gained two steps upon the masters, that is to say, the margin of profit on a ton of iron has been twice narrowed within the last few years by the price of iron having been reduced without a corresponding reduction in the price of the ironworkers' wages, so that the ironworker has gained two steps for his labour over the price that the master has sold his iron for.

10,416. Has the action of the unions had any bearing upon the proportion of wages to the price of iron?—Very much indeed.

10,417. (*Earl of Lichfield.*) Since then have there been any unions in existence in the iron trade in your part of the country that you have been aware of?—It is difficult to say when combination ended and unionism began. There was always a combination amongst the colliers whenever there was a strike, but at what point it glided from a temporary combination into an organized union I can hardly say.

10,418. But I understand you to attribute the rise in wages in the district to the action of the unions; did you mean of organized unions, such as we call trades unions, or did you merely mean combinations of the men?—That march was stolen on the masters just about the time that the temporary combinations ended and unionism began.

10,419. Then we may date the existence of unions from that period. When was that?—I see that on August the 19th, 1863, the declared price of iron (for the actual price and the declared price are always very different in South Staffordshire) was 7*l.* I have a note to that effect in my note-book. It was not prepared in anticipation of this examination, but I have just discovered it. The price was advanced on that day to 7*l.* 10*s.*, whilst the wages, which had been 7*s.* 6*d.*, were advanced on that day to 8*s.* 6*d.*, so that the masters lost 6*d.* by that move.

10,420. That was in August 1863?—It was in August 1863.

10,421. Did that advance in wages follow immediately upon an advance in price?—The alteration in wages and the alteration in price took effect at the same moment.

10,422. It followed immediately?—They were simultaneous; the alteration in the wages and in the price of the produce of those wages took place at the same moment.

10,423. I thought you said that there was a gain to the men at that time; is that the time you now refer to, August 1863?—That was one gain of 6*d.* to the men. The puddler ought to have been advanced from 7*s.* 6*d.* to 8*s.*, instead of which he was advanced to 8*s.* 6*d.*, so that the masters lost 6*d.* by that fluctuation in the price of labour.

10,424. At that time was there any organized union existing in that part of the country?—I should hardly like to answer that, as to date. There was a combination; I make a difference between a combination of men for the time being and an organized union. I can hardly tell you at what time the combination ended and the union began.

10,425. But you know that there have been unions in existence since that time?—Certainly.

10,426. And they were established, as far as I understand you, at that time?—Somewhere about that time.

10,427. Was it in consequence of the action taken by the masters then, or had they been established before, and did they bring about that gain to the men; that is what I want to ascertain?—I can hardly answer that question.

10,428. Then I understand you to say that you are not in a position to attribute that rise in wages which took place in August 1863 to the action of the trades unions, as we now understand them?—There was a pressure put by the men on the masters, but whether that pressure was the result of a combination or of an organized union, I am unable now to remember.

10,429. What other rise has there been in the wages in that district?—In the following September (September 1863) iron was advanced 10*s.* a ton more, and the wages went up (when I say wages, I am speaking of puddlers' wages only, because that is a sort of datum line that all others are guided by) from 8*s.* 6*d.* to 9*s.* 6*d.*, so that the masters lost a second 6*d.*, and the men gained a second 6*d.* more there.

10,430. Do you attribute that to the action of the puddlers' union?—To the pressure of the men upon the masters as the result of combination, but really I am unable to say when the combination ended and the union began without referring to notes which I have not here.

10,431. Can you refer us to any instance in which the union has acted as a union for the purpose of raising wages or of resisting a reduction?—Yes. I can speak more particularly of the time since 1864, because, although for 21 years I have had the management of the colliery department, the ironworks have only within the last few years come into my management, and therefore I am not so familiar with the iron trade about the time that you are speaking of as I am with it since that time; but on each occasion, when there has been any difference between the masters and the men, the union has dealt with this matter, in my opinion at all events, not so much a question of what the masters could bear or the state of trade in the country would justify, but as a question of whether by putting the screw on the masters they could wring from those masters better terms than they then had, regardless of whether it was for the permanent interest of the master, or the permanent interest of the trade of the country, just as though the markets of England ruled the whole world instead of having, as they have now, to compete with Belgium, Prussia, Austria, and France.

10,432. Had the unions anything to do with the North Staffordshire strike; are you aware whether they took any part in it?—I know it by hearsay. I am more practically acquainted with the strikes in my own neighbourhood. Turning for a moment from iron to coal (in South Staffordshire are very much mixed up), I could give some facts which might be useful. On the 1st of July 1864 it was found necessary to reduce the price of coal in order to reduce the price of iron, and the moment the attempt was made by the masters to reduce coal the union stepped in and collected large sums of money (the particulars of which I have here), and, putting all reason aside, were determined to stand out to force the masters to keep to the old rate of wages. I myself met a very large number, perhaps 10,000 of the men, and had a long discussion with them, and used such practical arguments that the leaders were quite satisfied with the reason of the thing; but instead of that leading them to induce the men to accept the masters terms the whole conference ended in their saying, "It is very true, sir, but still unless we can get our extra 6*d.* a day we will not go to work." That was the result of our conference with the men, and although something like seven-tenths of the men were willing to go to work, and did their best to go to work, and ran the risk of all sorts of terrorism, yet they were so kept down and overawed by the few who were the leaders of the union that they dared not, and did not, go to work for a long time. In some instances (and I have a list here of four explosions) of cottages in which the men who were willing to work lived were attacked in the night-time by the union men, and they had various missiles of an explosive character thrown into them. All the details of those cases I have here, and I will give you one or two instances if you wish to hear them. At Musham, in the parish of Dudley, at a cottage belonging to Rowley, who with his wife and three children was asleep upstairs on the 13th of October

1864, about 2 o'clock in the night, two men appeared outside the house and were seen by J. Dymock, the father-in-law of Rowley, to throw a tin can through the kitchen window, which immediately exploded with a loud noise, blowing the front wall completely out, and part of the end wall. The bedroom floor was forced up and partially shattered, and the whole roof was more or less damaged, and a part of it was entirely blown away. Miraculously, the five persons who were asleep escaped injury, except Rowley, who was burnt a little. He had been working down a coalpit, and did not belong to the union. The next morning I visited his cottage, and immediately had it rebuilt, and put it into the best state of repair; and every cottage that was afterwards blown up I treated in the same way, so that the innocent party who was attacked by the unionist should not suffer from his good intention to work in the face of the union men.

10,433. (*Mr. Mathews.*) These cottages were on Lord Dudley's estate, I suppose?—Three were and one was not. A reward of 50*l.* was offered by the Crown and 25*l.* by the Dudley magistrates, and eventually a man named Parkes was convicted and sentenced to 10 years' penal servitude. The cost of Parkes's defence was, no doubt, borne by the union, as I can show you from a book which was presented to me a few days ago. Some of those who have been leaders of the union hearing that I was going to give evidence paid me the compliment of having this book (*producing it*) reprinted, and made me a present of it, that I might make use of it. It shows all the monies received during those 20 weeks and all the expenditure. In it I see various sums for Mr. Kenealy and other learned gentlemen at the county assizes. There is just enough in it to identify these various expenses, with the act of blowing up the cottages.

10,434. Can you put in that book?—I can put in a certified manuscript copy of it; I would rather not part with the book itself.

10,435. (*Mr. Hughes.*) They have probably printed other copies of it?—I believe that this is the only copy. Doubtless there were several copies of it struck off at the time, but it had gone out of print, and this was struck off for me a short time ago.

10,436. Was Parkes proved to belong to an union?—"Mr. Bennett to attend at Dudley in the case of Daniel Parkes;" there is the name.

10,437. That is the proof, as far as you have it of his membership?—It is difficult to answer that question at this moment. Inasmuch as they pride themselves on being the leaders of the union, of course I could not produce legal evidence as to whether they were or were not, but it was generally admitted at the time that Parkes not only belonged to it, but that he was one of the leading men of the union.

10,438. I do not know the fact one way or the other. I only ask whether you know it?—I cannot pretend to establish it in the way that a court of law would require; but the presumptive evidence is, that he not only belonged to it, but was one of the leading men of it. There is another curious case of explosion (this is near Dudley), in which the missile instead of going through the window into the house and exploding there, hit the bar of the window, fell back and exploded near the man who had thrown it, and blew the man's cap off his head. He ran away leaving his cap behind, and in consequence of that the police afterwards discovered him, and he was convicted by means of his own cap which had been blown off by his own act.

10,439. (*Mr. Booth.*) Have you anything to connect that man with the union?—Yes, he was a leading man of it. That book which I have already shown you contains evidence of the union defending him.

10,440. (*Mr. Merivale.*) Was he convicted?—Yes, and sentenced to 12 months' hard labour. Here are my notes of the case which I have just given. About 10 minutes to 4 o'clock on the morning of the 11th of October 1864, a can containing gunpowder was thrown at the window of the house of John Haywood, at Springs Mire, near Dudley. Fortunately the can struck the bar of the window and fell back on to the footpath, where it exploded, blowing off the cap of the man who threw it. Haywood and his wife and eight children were asleep in the house. Haywood was then working as collier in defiance of the union. The explosion blew the cap off the head of the perpetrator who sent it, who turned out to be Edward Wilkes, and he was sentenced to 12 months' imprisonment. Francis Jeavons was also convicted, and received the same punishment. A reward was offered by Government and by the local authorities of 60*l.* Jeavons and Wilkes were on strike. Those are my notes of that case. I have others, but it would merely be repeating the same sort of thing to read them.

10,441. (*Chairman.*) It is all the same strike, is it?—Yes, all the same strike.

10,442. (*Mr. Mathews.*) Perhaps you can give us these cases, if desired, in writing?—Yes. In one instance one of our agents who had the management of one of our collieries—his name is Thomas Sheen—was succeeding with the assistance of the police to get a number of our men to work, and they were met by an organized body of colliers from another district. They managed things so cleverly, that to intimidate the colliers of one district they would import the colliers of another district a long way off, so that they could not be known by any of the authorities in the district into which they were sent, and they could exercise a great deal more terrorism over men in that way than they could if they were influenced by the union men of their own district. In this case our agent was threatened, and, to the surprise of the mob, he drew a revolver and said that if the man who threatened him struck him (he had got a great bludgeon) he would at once use his revolver, and this struck such terror into the man who was nearest to Sheen that he drew back, and the whole mob drew back also.

10,443. (*Earl of Lichfield.*) What was the date of this?—This was in the autumn of 1864 when the great colliers strike took place. On another occasion we got one of our pits to work, where there was a great deal of ironstone on the bank, many thousand tons, and a mob (it is reported to me of 1,000 men, but it is difficult to calculate numbers) came and threatened that if the men who were ready to go down to work did not refrain from going down they would throw the engine driver down, and fill up the pit with the ironstone on the bank. That prevented the pit working, although the men were willing and desirous to go to work.

10,444. At that time the colliers marched about in large bodies along the roads, did they not?—Not only along the roads, but anywhere they chose. They came on to some of our collieries away from the roads, and this was an instance; I mention it to show that they did not confine their processions to the roads, but even came over private property, as though they had a right to do it; and, as I have already said, threatened to throw the ironstone down the pit. And in many instances they fastened up the doors of the houses in which the colliers lived who consented to go to work, so that when they got up of a morning they could not get out of their houses; they were literally nailed up in their own houses; and one of our charter-masters had one of his men thrown into the canal because he persisted in working. As I said by far the greater majority (seven-tenths I should say) of the men were willing and desirous to go to work, but were deterred from doing so by the action of the unionists.

10,445. Did that state of things last for a considerable time?—From Midsummer to about the 20th of November.

10,446. And at last the authorities interfered and put a stop to those proceedings?—Yes, but another fact which I will mention had also a great influence over the men. Finding that none of our own agents and people had anything to do during the strike, I sent them all over England, and employed all our engines and trucks, and so forth, in importing coal

Mr. F. Smith.
28 Nov. 1867.

from every part of England where coal was to be had. The colliers finding that this was going on, made an arrangement (these facts were given to me by one of the great leaders of the strike who was a party to giving me the book I have referred to) to blow up one of the railway bridges, so that no more coals should be brought. Well, the authorities took such care to prevent that that the coals still continued to come in, and I brought it in in such a wholesale way that I built up a large wall of coal nearly round one of our works.

10,447. Are you prepared to give the name of the man who gave you that information?—I think that it would require a little consideration; perhaps I ought to ask him whether I should mention his name.

10,448. (*Mr. Mathews.*) Could you ask him whether he would have any objection to come and state those facts himself?—I think he would be very willing to come and do so.

10,449. Or the other man Sheen?—Sheen would only speak about the bludgeon and the revolver.

10,450. He would speak to the fact of the violence?—Yes.

10,451. (*Chairman.*) Coal and iron, you say, are often intertwined?—In South Staffordshire they are more intertwined than anywhere else. To conclude my story, I built a wall many feet high and many yards wide, nearly round one of our large works. Then a procession of some thousands of colliers came to visit the works, and seeing this large store of coal said, "Well, it is no use our striking any more, the more we strike the more coal they get." That action on the Round Oak side of Dudley, simultaneously with the action of the police, on the other side of Dudley, in attacking and breaking up the band, brought the great coal strike of 1864 to a close.

10,452. Had that great importation of coal into the country an effect upon the coal trade of the district for a considerable time?—We have never recovered that; it brought in a great deal of foreign coal. I mean English coal which was not Staffordshire coal into the district on that occasion, and it has never ceased to come in since.

10,453. (*Earl of Lichfield.*) Going back to the iron trade, you are aware of the existence of unions among the ironworkers latterly, I believe?—Yes.

10,454. Can you state any case in which they have taken an active part in resisting a reduction of wages or obtaining a rise beyond those which you have mentioned, and those you say you cannot positively state were owing to the interference of the union?—They are always on the alert to get a rise whenever they can.

10,455. Men are always looking out to get a rise of wages if they can, just in the same way as masters are. I suppose to get a rise of prices?—Yes. The unions have improved very much lately, but until lately the unions seemed to me to think that if they only put a certain pressure on the masters, they could force the master up with his prices and *pari passu* with their wages. That might have been so formerly, when the produce of England found its way into all parts of the world, but now we are being very much competed with by Belgium, Prussia, Austria, and France, and although we still continue to send a great deal of iron into other districts, yet those countries I have named send a great deal in also, where we formerly had the monopoly. If the unions force the masters up with wages in England, and consequently they are obliged to go up in their prices, the consequence is that we have to compete under that much greater disadvantage with the produce of Prussia, Austria, France, and Belgium.

10,456. But it occurs to me that with the exception of the strike referred to in 1863, there has been no strike of ironworkers in South Staffordshire at all. There was one in 1863 which you have already referred to, I think?—The one I have referred to was a coal strike in 1864.

10,457. But you have referred also to a strike in the iron trade in 1863?—I do not think I stated that there was a strike in August 1863.

10,458. (*Mr. Booth.*) You said that pressure was put upon the masters, and a rise followed?—There was pressure put upon the masters, but I have no record here that there was a strike.

10,459. (*Earl of Lichfield.*) In point of fact there has been no strike except that 1863 strike, and at that time you say you are not aware that the unions were in existence in South Staffordshire?—I should like it put in somewhat different phraseology; there was a combination of the men, but whether that was a temporary combination or an organized union, I am unable at this moment to say. The general lock-out began Monday, March 6th, 1865.

10,460. That 1863 strike is the only strike you know of that has taken place in South Staffordshire on the part of the ironworkers?—There must have been strikes before, but I am not prepared with evidence on that point.

10,461. We have been told that the rate of wages has always been governed by the price of iron in Staffordshire. That when the price of iron goes up, wages rise in proportion, and that they fall in proportion when the price of iron goes down. That is so, is it not?—That has been pretty nearly so. I find now from my notes that the facts are these: On December the 31st, 1864, we gave 14 days' notice to the puddlers to reduce their wages to 9*s.* 6*d.* and the millmen 10 per cent. All in South Staffordshire and the North of England accepted the notice, but the North Staffordshire men struck. The general lock-out began Monday March the 6th, 1865.

10,462. I did not refer to that. That was a lock-out, and was not a strike brought about by the ironworkers in South Staffordshire. I will come to that presently, because that is a different point. That arrangement which I spoke of with regard to wages has been in existence for a considerable time, has it not?—Yes, but it has not been adhered to. As I have shown you, the men have gained upon the masters.

10,463. I want to know whether whenever the price of iron has risen the rate of wages has risen in proportion for all those employed in the iron trade, or has it been only for the puddlers?—For all.

10,464. And in the same proportion. For instance we have been told that when there is a rise in the price of iron of 1*l.* a ton, there is a rise of 10 per cent. in the wages?—Of 10 per cent. in the millmen's wages, and of 1*s.* in the puddlers.

10,465. But is it always the case that the rise in the case of the millmen is the same as in the case of the puddlers?—Yes, it professes to go on these principles: for every 10*s.* rise or fall in the price of iron puddlers wages go up or down 6*d.* a ton. Millmen's wages go up or down in the same ratio, only that is calculated by per-centage and not by money. 10 per cent. to the millmen corresponds with 1*s.* per ton to the puddler.

10,466. The rise has always taken place upon that scale?—Yes, only that the men on two occasions have, if I may use the word, stolen a march on the masters and gained an advance, which the masters have not recovered, of two sixpences, making 1*s.* altogether.

10,467. Does that apply both to the puddlers and to the millmen?—It applies to the puddlers only.

10,468. I ask that question for this reason. We have been told that the proportion of wages to the cost of production is so large, that it makes it necessary for a fall in wages to take place with a fall in the price of iron. What I want to ascertain is, whether the fall that takes place in the wages applies to all the men employed in the trade, so that the millmen share it in the same proportion as the puddlers?—My impression is, that the millmen had not the same advantage as the puddlers over the masters on those two occasions. The masters have never recovered that lost ground with the puddlers. On one occasion they were actually three sixpences ahead; the masters have recovered the third sixpence, and now there is a difference of two sixpences between

the men and the masters. And for my part I do not wish ever to see a puddler working at a less rate of wages than he is at this present time, even though unfortunately the price of iron should have to be reduced, because the moment you bring a class of men like the puddlers, who are very hard worked, below a certain rate of wages, that moment you riddle the community of the best men. They are draughted off to other occupations, and they bring up their sons to other trades.

10,469. Still, if the price of iron will not permit the existing rate of wages to be continued, it is impossible to continue it without carrying on the works at a loss?—But I would rather have an ironmaster work for no profit at all for a short time, than I would for a short time reduce my puddlers to any price below what they are receiving now, because it would recoil upon myself.

10,470. (*Mr. Mathews.*) You would not wish to see them reduced below 8*s.* 6*d.* a ton?—Just so.

10,471. (*Mr. Hughes.*) Then you think the unions were right in making this claim for a rise; that they were acting for the benefit of the community in doing so?—My own feeling is such, that as a master I do all I possibly can to get the price of produce and the price of labour up to the highest point I can, consistently with the state of trade, without waiting to have any pressure put upon me.

10,472. And you think that the action of the union in this case has been beneficial, because you have stated it is in your opinion desirable that this rate of wages should be retained?—It should be retained when the condition of the trade and the condition of the country will admit of its being retained. But the union proceeds on another principle. "We will "have wages up to the highest point we can get "them to, regardless of anything else."

10,473. But the result of their action has been to keep wages at this point where they now stand which you think is an equitable and right point, and which you do not wish to see them depart from?—At the end of 1864 or 1865 they had forced up wages to such an inordinately high rate, that it reacted upon the country, and we have never recovered that. It drove the trade out of the country. We did very well for a few months with high prices for produce and high rates of wages, but it had such an effect upon the trade of the country that it drove it out into other countries, and we have never since been able to get it back. It has reacted upon us ever since, and we are now suffering in long periods of depression for the little prosperity that we had during those few months, when wages and prices were pushed up inordinately high by the operation of the union. They felt that at that particular moment the masters would bear a little pressure put upon them, and that pressure was put upon the masters, and up went labour and also produce, and that has reacted upon us most terribly since by permanently diverting our trade.

10,474. (*Mr Mathews.*) When you speak of your desire not to see the price of puddling go below 8*s.* 6*d.* I believe the understanding of the trade is now that it is never reduced below 7*s.* 6*d.*?—Yes.

10,475. Inasmuch as all other wages are regulated by the price of puddling does your remark as to puddlers wages remaining as they are apply to all other descriptions of wages?—No, because some other descriptions of wages are overpaid.

10,476. If wages rise and fall with the price of iron, how is it that you wish puddlers' wages to be on a different footing from other wages?—Because there is a disproportion between the wages paid to puddlers and the wages paid to some other classes of men.

10,477. That is the only exception; generally the relations exist very much as they have always done, so that that does not apply to the bulk of wages, does it?—No, but to certain departments of ironwork in which there is so much of the principle of farming out work, and then some few lucky men or ingenious men get hold of this work which is farmed to them and net very great profits which they themselves get out of the men whom they employ.

10,478. That is owing to their taking piece-work?—Yes.

10,479. (*Earl of Lichfield.*) To what departments do you refer, when you say that they are too highly paid?—Shearers, and millmen, and rollers, and stock takers; they are paid exceedingly high.

10,480. They are too highly paid in proportion to the amount of skill required in their trade as compared with the skill required in the case of puddlers, you think?—Yes. They have forced masters up by means of combination.

10,481. Then can you point to any instance in which the unions of the millmen have produced a rise in wages?—I can only point to the general effect of it. I cannot point to any one individual instance without working up evidence of that kind; but the practical effect of it on a period of years is that they are extravagantly highly paid.

10,482. But if you always paid your wages upon the same scale, according to the price of iron, there must have been something to interrupt that arrangement?—I presume that the improvements of machinery from time to time have facilitated the work of the millmen and the shearers, and those classes. Perhaps when the scale of wages was originally agreed upon it was fair and reasonable, but of late years (I can only account for it in this way at the moment) probably the improvement of machinery and so forth has enabled a man to do very much more of some classes of work in a given time now than he could do formerly, whilst the same scale of wages that he used to have he obtains now.

10,483. (*Mr. Mathews.*) Is there any material improvement of machinery in mill work, except perhaps in the shears?—In the general carrying out of the works there is, so that a man can do more work in a given time than he could formerly.

10,484. Do you think that that applies generally to mill work?—I know what is being done now, but I must appeal to older witnesses as to what was done formerly.

10,485. (*Mr. Hughes.*) But when a profit is got in that way by the introduction of machinery do not you think it desirable that the men should share to some extent in it?—Yes, but the moment you introduce anything new of that kind the union is down upon you at once, and will not have anything new unless it lands the men in a better position than they were before.

10,486. (*Mr. Mathews.*) Taking puddling, there is no improvement in material machinery there, but the process is very much the same as it was?—Yes.

10,487. (*Earl of Lichfield.*) I understand it to be your opinion that while the scale of wages is the same as it used to be, machinery has not facilitated the work of puddlers as it has facilitated the work of millmen?—Yes.

10,488. I was going on to ask you this question, how is it, if that is your opinion, that when a reduction has taken place in the wages, you have not put a larger portion of that reduction upon the millmen when you thought they were getting too high wages?—It ought to have been done, but it has not been done. I must say this, that the millmen, on the whole, are a most orderly set of men, and in what I have had to do with their union they have acted in a way which has been very much to their credit. I must give the millmen credit for that. I have not known the millmen attempt to be extortionate; perhaps that may be attributable in part to their knowing that they have high remuneration for the work that they do.

10,489. But do you think that they would resist a reduction?—Yes.

10,490. And has that had anything to do with your not having carried out the arrangement which I just now suggested, that you should reduce their wages more in proportion to the puddlers; has the fact that they would resist a reduction influenced you in deciding not to reduce their wages in such a proportion as you think right?—Yes.

Mr. F. Smith.

28 Nov. 1867.

10,491. (*Mr. Mathews.*) Do you think that it would be possible to reduce millmen's wages if you did not reduce puddlers?—It would be difficult.

10,492. They would resist it upon this ground, that inasmuch as puddlers' wages and theirs always rose or fell *pari passu*, you have no right to reduce them alone?—Yes.

10,493. If you say that the existing wages of the puddler are fair and reasonable, with the high rate of wages that that would involve in Staffordshire and other districts, how is it possible for them to compete on the continent for the iron trade?—We cannot. We are losing ground daily by the present high rate of wages being paid—every day the country is suffering.

10,494. If the Staffordshire men were to adopt the principle that you laid down, that puddlers' wages ought not to be reduced below what they are, would it not be the destruction of the Staffordshire trade?—There may be circumstances that would absolutely necessitate it. When I gave that opinion I meant that I should be sorry to see it done. I did not intend to say that it must not be done.

10,495. It comes to this, then, that although it may be a matter of necessity that it should be done, you as well as others would be sorry for the necessity to exist?—Yes.

10,496. (*Earl of Lichfield.*) I understand you to say that if any further reduction were necessitated by the price of iron, you think that that reduction ought to come off other departments of the trade, and not the puddlers?—The puddlers last of all. I would take it off every other department before I came to the puddlers.

10,497. (*Mr. Mathews.*) Would it be possible to disturb one department without disturbing the others?—Almost impossible. I meant to say that I would submit to a great loss in my profits before I would consent to a further reduction in the puddlers' wages.

10,498. That is very magnanimous, but we have had evidence, I think, that there is no profit in the manufacture of iron on the existing rate of wages; that, in fact, the present price of iron is subversive of all profit, and therefore giving up profit is not giving up a great deal?—Yes, that may be so.

10,499. What I want you to explain to the Commission is this: that if the ironmasters, as well as anybody else engaged in any other occupation, do not like encountering the unpalatable operation of reducing wages, so far you sympathise with them, but that the existing price of iron, and the existing rate of wages on the continent, compel a reduction in this country and in Staffordshire if it is to hold its ground at all?—Yes.

10,500. That would apply to puddling as well as other departments, inasmuch as you must reduce puddling if you reduce other branches?—Only I would reduce puddling last of all.

10,501. (*Sir D. Gooch.*) If you had the option, that is?—If I had the option.

10,502. (*Mr. Mathews.*) Is it not the practice to reduce the different departments simultaneously?—It always has been the practice until the last year or two to reduce not only the ironmen but the colliers, the limestone men, and the ironstone men. But the last year or two that simultaneous movement has not taken place; iron has sometimes gone up or down without coal going up or down with it.

10,503. (*Mr. Hughes.*) Perhaps you do not take such a doleful view as some of the witnesses, and think that there may be a little profit even now to be made out of the iron trade at present prices?—Judging by the number of bankruptcies and insolvencies that have lately taken place in South Staffordshire, people who have compounded with their creditors for something under 1*s.* in the 1*l.*, and failed for very large sums indeed, there must be a great many men who have been working upon their capital as long as they could, and then when they have spent the last pound almost of their capital, they have gone into the Court of Bankruptcy. During this great colliers' strike there was one ironmaster, with four blast furnaces, who employed an immense number of men, who was regularly driven into the Court of Bankruptcy, and failed for several hundred thousand pounds, through that strike, and those works have never started since. They were destroyed there and then by the strike, and they have never started since.

10,504. But I suppose that though individual ironmasters and other masters may lose in a year, the aggregate trade to the country must be done at a profit every year?—The reply to that is this: In the iron trade, when everybody is working at a loss, those who happen to have all their ironstone, and all their own coal, and all their own limestone, can of course hold out longer than those who have to buy those things, because though they lose on their iron they gain on their mineral and so save themselves from ruin.

10,505. Then in that case would not all the ironmasters reduce their works as far as possible, and make as little as possible?—Some men have embarked so far in the trade that they cannot afford to reduce their make. They have bills running and which they could not meet if they were to reduce their make. Many of them feel that as long as they can just tide on, keeping their works going and stave off the day of settlement when they must go into the court of bankruptcy, they have just snatched so much from ruin.

10,506. But they would not increase their production?—No, they could not very well increase their production, because they want more capital, and that is just what they are short of.

10,507. Are you aware of the fact that the last returns which we have of the Board of Trade show an increase of upwards of 1,500,000*l.* over the previous year; that is to say, that in 1866 the returns of the Board of Trade show that the export iron trade of England was 1,000,000 and a good many hundred thousand pounds greater for that year than it was in 1865; and how do you reconcile that fact with what you say is the state of the iron trade?—Under a state of things in which it appears that every ironmaster must be losing, in 1865 the exports are 17,950,000*l.* and in 1866 they rise to 19,063,000*l.*?—I can perhaps account for that in this way. After the peace which followed Waterloo, I know for a historical fact, that you could buy from the colonies many British products cheaper than you could purchase them at home; the fact being that trade had by some means got deranged. And I have lately bought very largely certain railway materials quite new for 60 per cent. less than I can make them for, trade has been so deranged; and stocks are being sold up owing to the great number of bankruptcies in the country — trustees, inspectors, and so forth realizing—they must sell at whatever the market will enable them to sell at, and if tney cannot get the price that they ought to get with a profit on it they will get the next best price they can—and in some instances, as I tell you, I have bought large railway stocks for 60 per cent. less than I can make them for.

10,508. (*Mr. Merivale.*) But I suppose that these small incidental causes, such as the glut of the market which caused the export to the colonies, will hardly account for so general a result as that shown by the Board of Trade returns—it wants some greater cause?—It wants thinking out, but I am mentioning practical points that come to my mind at this moment.

10,509. May I ask you this question—is it not the fact that independently both of unions and of foreign competition the trade of South Staffordshire in particular has had a good deal to fight against lately in the competition of other districts in the United Kingdom? Has not the production been increasing in other districts in the United Kingdom in a greater ratio than in the older districts, such as South Staffordshire?—Yes, I can explain that South Staffordshire makes two classes of iron, one very good, and one very bad. It has nearly a monopoly for the very good, but other districts have been competing with it in the very bad,

and the makers of very bad iron in South Staffordshire have been run very hard, so much so that they have been mostly broken up, the competition has been so great.

10,510. Then putting them together the credit of the district has suffered from the causes which I have referred to?—Yes, South Staffordshire has suffered from this fact, it contains a good deal of coal called the ten-yard coal, which makes very pure iron, the purest in the world perhaps, and whilst the iron trade has to compete with the iron trade of the world the coal trade of South Staffordshire is a local trade, and there is not the same relative proportion in the price of coal and iron in South Staffordshire that there is between coal and iron in every other district in England.

10,511. These causes which you clearly put come to this, that South Staffordshire has had rather a hard time of it, independently of foreign competition and unions?—Yes.

10,512. (*Earl of Lichfield.*) Have the puddlers and millmen a separate union?—They have. With regard to the Board of Trade return that affects the trade of Scotland and Ireland too I understand, it is almost impossible in a large iron-making country like Great Britain and Ireland to prevent the works generally expanding, regardless of temporary profit or loss, and where they expanded generally of course the produce would be greater.

10,513. (*Mr. Hughes.*) They would not expand if they lost?—Well, we are getting to make steel now.

10,514. (*Mr. Mathews.*) Is it not commonly the case that in proportion to the fall in the price of iron the exports increase, and that a rise in English iron stops the exports very materially?—Yes.

10,515. (*Mr. Hughes.*) Have you attended much to the Belgian question?—I have attended very much to the relative position at the Paris Exhibition of England and the other countries which I have mentioned. I have made it a special study, and the other day I addressed our men for an hour on that subject, and furnished them with facts of a most minute character on the practical merits of the iron productions of England, Sweden, Austria, Prussia, and France. I said less of the productions of Belgium than of the other countries, because there is little of the Bessimer steel made there.

Mr. F. Smith.

28 Nov. 1867

10,516. Are you aware what the total production of Belgium was as given by their returns last year?—No, but I have read it. I have taken less notice of Belgium than of other countries. The fact is that we used to supply certain markets, and they have been taken from us, and I find on investigation that they have been taken from us by countries which formerly made no iron. That has been in consequence of the unions forcing up our wages and our prices, and that has reacted on us, and we have lost our trade for ever.

10,517. It might be attributable to other causes than that?—I think that that is the main cause.

10,518. For instance, are you aware that in Belgium all minerals belong to the Crown?—No, I know nothing about Belgium.

10,519. If the leases of these are at merely nominal rates would not that be another cause?—I daresay. I shall be very happy to put in evidence about a column of a provincial newspaper, if it is so wished, containing a report or summary of what passed between me and our men at one of our works last week. It contains a number of facts of some interest.

10,520. (*Mr. Booth.*) Was that drawn up by yourself?—No, it is a local reporter's account of what I said.

10,521. (*Mr. Merivale.*) Do you agree in the report so given of your own sayings?—Yes.

The witness withdrew.

Adjourned till to-morrow at 11 o'clock.

1, Park Prospect, Westminster, Friday, 29th November 1867.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.	HERMAN MERIVALE, Esq., C.B.
The Right Hon. the EARL of LICHFIELD.	JAMES BOOTH, Esq., C.B.
The Right Hon. Sir EDMUND WALKER HEAD, Bart., K.C.B.	THOMAS HUGHES, Esq., M.P.
Sir DANIEL GOOCH, Bart., M.P.	FREDERIC HARRISON, Esq.
	WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. WILLIAM SARGEANT RODEN examined.

Mr. W. S. Roden.

29 Nov. 1867.

10,522. (*Chairman.*) Are you the managing partner of Lord Granville's works in North Staffordshire?—Yes.

10,523. How long have you held that situation?—About 12 years.

10,524. Those, we know, are large works. What is the number of men employed, or what is the sum of wages paid weekly, to give us a criterion?—We pay altogether in the various departments, in collieries and ironstone works, furnaces and forges, I should think as nearly as possible 3,000 men. I think we pay 3,000*l.* a week in wages, as near as possible, on the whole of the concern.

10,525. Under the same firm, have you coal and ironstone and extensive works for the manufacture of iron?—Yes. Our firm is called the Shelton Bar Iron Company, and consists of Lord Granville and myself, and three other partners.

10,526. Is that a manufactory where you have bar iron of the high brand that has been spoken of here, or what character do you give to your brand?—It is the usual brand of Staffordshire iron that we make there.

10,527. In your works is there a given proportion between the published price or the ascertained current price per ton of bar iron and the rate of wages for any one class of the skilled workmen in the works?—Yes; our rate of wages is regulated by the declared price of iron. Up to the present time, with the differences which have been stated before, and of which you have the particulars, they are regulated by the declared selling price of manufactured iron. The declared selling price at present being 7*l.* 10*s.* a ton, we pay as wages 8*s.* 6*d.* a ton. Formerly we used to pay 1*s.* in the 1*l.* on the price, so that if iron was 8*l.* a ton we paid 8*s.* as wages in years gone by; but for various reasons now the difference in the rate of wages has increased by one-eighth in proportion to the declared selling prices of iron as compared with what it used to be. I might mention that this selling price is only received by very few firms in Staffordshire; all the others are at various prices under that

Mr. W. S. Roden.

29 Nov. 1867.

price, that being the maximum price, our wages are regulated by the maximum price.

10,258. How is the current price settled? is it by half-yearly meetings?—By meetings held quarterly at Birmingham. To the price as settled then a certain number of the ironmasters stick, and they do not sell under, but the greater portion of them get as nearly that price as they can, and are governed by the absolute market value of iron and competition.

10,529. Is there one brand indicating one value for several firms?—They have different brands, but they are understood in the trade to be of the same nature and the same quality; they are more known by the names of the firms as to the character of the iron that is produced.

10,530. As far as you know, all those firms stand in equal estimation by the buyers?—Yes; all who get what we term the list prices stand as nearly as possible on an equality.

10,531. Has there been much difficulty about the rate of wages during your time owing to the action of trades unions?—Yes, we had a strike in North Staffordshire in 1865, which lasted on the average about 20 weeks.

10,532. (*Earl of Lichfield.*) Are the prices in North Staffordshire ruled by the prices in South Staffordshire; I understood you to say just now that they are?—Yes, to a certain extent, they are. We endeavour to get as near as possible to the South Staffordshire price, what is called the declared price, which is really the price of a few firms in South Staffordshire, all the others, in reality, selling under that price.

10,533. Those prices are fixed by the Ironmasters' Association in South Staffordshire?—Yes.

10,534. You have an association of ironmasters in North Staffordshire, I think?—Yes.

10,535. Then do they accept the prices fixed by the association of ironmasters in South Staffordshire; is that it?—Yes, that is it.

10,536. (*Mr. Mathews.*) The rate of wages is regulated by the declared price of iron in South Staffordshire?—Yes.

10,537. The price in South Staffordshire is declared upon certain marked brands applicable to a few houses?—Yes.

10,538. Those houses make a description of iron that is not generally made either in South Staffordshire or in North Staffordshire?—Yes.

10,539. The price of the marked brands being a more regularly uniform price than any other is considered the best basis on which to found the rate of puddlers' wages?—Yes.

10,540. Those houses who are not considered to come under the definition of marked brand houses get the nearest price to marked brand houses that they can?—Yes.

10,541. But the rate of puddlers' wages is fixed upon the declared price of marked brands in South Staffordshire?—Yes; the maximum price that is received by any maker.

10,542. And the parties who have no marked brands are not considered bound by the marked prices?—No; but they have to give the same rate of wages.

10,543. They get as near the prices as they can?—Yes, according to the quality of the iron and the circumstances of the case.

10,544. (*Earl of Lichfield.*) That being the case, some of the masters may be selling their iron at a lower rate, and yet giving the same rate of wages?—Yes; and they are doing that very thing at the present time.

10,545. (*Mr. Mathews.*) That is not an infraction of the understanding?—No.

10,546. They are free to do that if they like?—Yes.

10,547. (*Earl of Lichfield.*) Is that supposed to be a satisfactory arrangement by those masters who get the low price for their iron?—They do it, but of course it is not satisfactory to them.

10,548. (*Mr Mathews.*) In a good state of trade the low-priced iron comes closer to the declared price than it does in a bad state of trade?—Yes.

10,549. (*Chairman.*) I believe that you have prepared a paper to read to us?—Yes. This is a statement of a strike; it does not give any opinions, but is merely a statement of the facts as they occurred. "In consequence of the reduction in the price of iron" (that is, in the selling price of iron) "during the last few months of the year 1864, there was a general conviction that a reduction of wages of millmen and puddlers was absolutely necessary, and in consequence a meeting of the whole iron trade of the kingdom and held at Birmingham on the day of December 1864. At that meeting it was decided that the wages of puddlers should be reduced from 10*s.* 6*d.* to 9*s.* 6*d.* a ton, millmen's wages 10 per cent., and other workmen in proportion; and that a notice of such reduction should be given simultaneously by every master; and that in case there was a strike in any one district, and it could be shown that the trades unions combined together to uphold such strike, such combination should be met by a general lock-out at the ironworks throughout the kingdom. In pursuance of the above resolution notices for a reduction of wages were given, expiring on the 14th day of January 1865. While the notices were pending meetings of the puddlers' trade unions of the several iron districts were held in South Staffordshire. The result of these meetings, as then communicated to the press and the public, was that the men should accept the reduction and no strike take place. The workmen, however, of North Staffordshire intimated to their masters that they should not be bound by the resolutions of the trade unions and should not accept the reduction of wages; and the result was the strike, commencing in January 1865 and lasting for from four to six months. The workmen of North Staffordshire had no separate union, but almost the whole of the puddlers belonged to the Brierley Hill (South Staffordshire) puddlers' union or to the Gateshead union, and it was soon discovered that the men on strike were receiving support from both these unions. Upon this inquiries were made, and it was found that although the delegates' meeting at Brierley Hill had stated to the newspapers that they had decided to accept the reduction, they had in fact secretly resolved that the ironworkers of North Staffordshire should go out on strike, and that the other districts should accept the reduction for the present in order to maintain the strike in North Staffordshire. Mr. Kane, the president of the Gateshead union, afterwards publicly stated that the North Staffordshire strike was dictated by the unions."

10,550. (*Earl of Lichfield.*) With regard to that, would you tell us where that public statement was made by Mr. Kane—what do you refer to? Was it a letter or something that Mr. Kane said at a meeting?—Merely a report in a newspaper.

10,551. (*Sir E. W. Head.*) What was the evidence on which it was found that an agreement was made that the ironworkers in North Staffordshire should go out, and that they should be secretly supported by the unions in the other districts?—The admission of the unions afterwards, and the fact that the money was being sent into the district and regularly distributed amongst the men.

10,552. That was ascertained beyond a doubt, was it?—Yes, it was quite public.

10,553. (*Mr. Booth.*) You say that this was a meeting of the whole ironmasters of the kingdom; did it include the ironmasters in Wales?—It did not include the ironmasters in Wales. That statement therefore is not quite correct, it should have been "the iron trade of the North of England, Staffordshire and the midland counties."

10,554. (*Mr. Merivale.*) Do you include Scotland in "all the kingdom"?—The quantity of manufacturers of iron in Scotland is very small.

10,555. (*Mr. Harrison.*) It did not include Low

Moor, did it?—No, the Low Moor works are not included.

10,556. They are important works, are they not?—They have no bearing on our trade. Theirs is a special quality of iron that is worked differently from ours.

10,557. Still this statement would look as if it included them; they come into "the iron trade" surely?—Yes, they do.

10,558. You say here that up to the meeting of 1864, it was decided to reduce the puddlers' wages, but the understanding of the sliding scale was already in force at that time was it not?—The price of iron had been reduced 1*l.* a ton previously, and the men's wages were not reduced at the time; this was a resolution some few months afterwards to reduce the wages according to the arrangement.

10,559. Without reducing the price at the same time?—But the price was reduced. I am not quite positive about the month, in June say, and this was in December.

10,560. There was not a second reduction in December?—No; we took off 1*l.* in the ton and 1*s.* in the wages a few months later, that is all.

10,561. At this meeting which was held in December 1864, it was decided to reduce the wages upon the puddlers 1*s.*, and upon the millmen 10 per cent., but it was not decided to reduce the price of iron 1*l.*?—The price of iron had been reduced, the one followed the other; it was merely a matter of time.

10,562. When was the price of iron reduced?—About June; but I am not positive as to the month. It was a few months later that we reduced wages, whereas previously they had been reduced simultaneously here. In this case we gave them a few months grace.

10,563. It was not at the preceding quarterly meeting, but at the preceding quarterly meeting but one that the reduction in price was made?—I am not certain of the month. Previously we were paying 1*s.* the ton for each pound. Then we lost that 6*d.*, the first 6*d.*, and then another 6*d.* afterwards. But these two, the reduction in the price and the reduction in the wages, were practically simultaneous—one was consequent on the other.

10,564. At a distance of six months?—Yes.

10,565. (*Chairman.*) Will you proceed with your statement?—"The masters of North Staffordshire, "on learning these facts, called upon the masters who "met at Birmingham in December 1864, to carry out "the arrangement then made, and, after several previous meetings, at a meeting held at Birmingham "on the 16th of February 1865, the following resolution was unanimously passed:—'It having been "'officially announced that the strike of the puddlers "'in North Staffordshire has been directed by the "'executive of the puddlers' union, and it having "'been ascertained that weekly contributions are "'regularly levied and paid by the men employed "'in other districts in support of the strike, we, the "'undersigned, do hereby agree that we will give 14 "'days' notice on Saturday next, the 18th instant, to "'close our works unless the men in North Staffordshire shall before the expiration of that notice "'have returned to work at the same reduction in "'wages as have been accepted by the men in other "'districts;' and a notice was given on the following "Saturday throughout South Staffordshire, setting "forth the resolution and stating that unless the "terms of it were complied with all the works would "close on the 4th of March, and a similar notice was "given in the North of England that the works in "that district would close on the 11th of March. "The trades unions refused to terminate the strike "in North Staffordshire, and the works in South Staffordshire and the North of England were therefore "closed in pursuance of the notices. The lock-out "in the North of England only continued a fortnight, "as the masters there re-opened their works at the "expiration of that time on the Gateshead workmen's "union by its president promising not to contribute "to the support of the men on strike. On the 22nd "March the London Trades Council passed a resolution in favour of arbitration, which Mr. Roden, the "chairman of the North Staffordshire Ironmasters' "Association at once accepted. The following is the "report in the 'Staffordshire Advertiser' published at "the time of what occurred: 'We learn from The "'Times that at a meeting of the London Trades "'Council on Thursday night (March 23rd) the following resolution was adopted by a small majority, "'Mr. Potter opposing it as vague—'that this meeting regrets exceedingly the great suffering and sad "'feeling which the cruel act of the employers in "'locking out so many thousands of the workmen "'has created, and hopes that the workmen in the "'iron trades will agree to submit the whole question to arbitration.' It was also agreed that 'in "'the event of the employers refusing to accept arbitration as a means of an amicable settlement of "'the question, the delegates present pledge themselves to use every means in their power to support the men on strike.' In the same paper the "following letter appeared which proves that if the "North Staffordshire puddlers are prepared to act "on the advice given them by the United Trades "Unions the dispute may soon be terminated: Sir, "In 'The Times' of this morning I observe that at a "meeting of the London Trades delegates held yesterday, Mr. Baker, a North Staffordshire delegate, "stated, 'If, however, the masters would consent to "'open their works to the men in South Staffordshire, then the men of North Staffordshire were "'willing to resume their work, and leave the question of wages to be settled by arbitration.' The "wide-spread distress caused by this unhappy dispute is regarded by no body of men more sincerely "than the ironmasters themselves, and assuming "that the delegate spoke with authority from the "puddlers I will, upon receivingan official intimation "to that effect, bring the proposal before the ironmasters, and use my influence to have it accepted. "I am, sir, your obedient servant, 'William S. "Roden, Chairman of the North Staffordshire Committee of Ironmasters. On this the North Staffordshire ironmasters met and agreed to arbitration. "At this time the Lord Lieutenant of Staffordshire "(the Earl of Lichfield) offered his services as arbitrator in the matter, and, after conferences separately with the masters and the men, he arranged a "meeting between them, which was held at Stoke, on "Wednesday the 29th of March. At that meeting, "after a long argument in which the men asserted "that this district laboured under disadvantages, and "that they were not getting sufficient wages to maintain them, and the masters replied that none of the "men present were getting less than 10*s.* a day, and "some of them as much as 16*s.* or 18*s.*, the masters "read a resolution they had come to to the effect that "they would allow the men to resume work at the "reduction, and leave the question of peculiar advantages and disadvantages to arbitration. The "men present, however, stated that they were not "prepared to treat at all, and they were sure the "ironworkers would never accept such terms. They "also stated that the statement of the recent meeting "of Trades Unions in London, that they were willing "to submit to arbitration, was made without their "authority or assent. On the following day (Thursday) Lord Lichfield submitted a proposal to both "masters and men that the men should resume work "and draw on account, leaving the amount of wages "to be settled by arbitration, and requested the masters to meet him at Stafford on the Friday (the 31st), "to consider his suggestion. At that meeting Lord "Lichfield submitted to the masters a formal agreement for reference to arbitration proposed by his "own solicitor in accordance with his proposal, and "after some discussion the whole of the masters

Mr. W. S. Roden.

29 Nov. 1867.

" signed the agreement, of which the following is a " copy* "

10,566. (*Earl of Lichfield.*) I think you need not read the agreement?—It is a copy of the original. " Immediately after the agreement was signed by " the masters, Lord Lichfield and his solicitor left " with it to attend a large meeting of the men then " being held at Hanley. Before his lordship arrived " the men had passed a resolution, of which the fol- " lowing is a copy: 'That if the South Stafford- " 'shire masters will open their works and let the " 'men resume work in South Staffordshire, and if " 'the masters in North Staffordshire will give the " 'men of North Staffordshire the old rate of wages, " 'they will submit the whole question to arbitra- " 'tion.' On his lordship's arrival he at once pro- " duced the agreement signed by the masters, and " explained that it agreed that the men should return " to work, and receive a draw of 40*s.* a week until " arbitrators, to be at once nominated by his lord- " ship, should decide upon the wages to be paid; and " his lordship strongly urged the men to adopt his " proposal, expressing his opinion that it was reason- " able and just, and that by their declining to enter- " tain it they would have the public verdict against " them."

10,567. You do not say that the arbitrators were to be approved by both parties?—That is in the body of the agreement. " The meeting deliberated upon " Lord Lichfield's proposal, but upon its being for- " mally submitted, not a single hand was held up in " its favour. Lord Lichfield thereupon returned to " Stafford, where the masters were waiting the " result of his visit to Hanley, and announced that " the men had altogether declined his proposal for " arbitration. During the following week the South " Staffordshire ironmasters represented to the masters " in North Staffordshire that the men in South Staf- " fordshire were most anxious to return to their work, " and would pledge themselves, if allowed to do so, " they would not in any way contribute to the sup- " port of the men on strike in North Staffordshire, " and the North Staffordshire masters being strongly " urged to give them permission to do so, the masters " of South Staffordshire declared the lock-out at an " end. In consequence of this the ironmasters of " South Staffordshire issued the notice declaring " their works open, of which the following is a copy: " —'Notice. At a meeting of the iron trade of " 'South Staffordshire, held at Wolverhampton on " 'on Wednesday, April 5th, 1865, it was resolved. " 'That the ironmasters of North Staffordshire " 'having by their trade resolution of April 3rd, 1865, " 'released this district from the undertaking entered " 'into with them on the 16th February 1865, " 'believing the assurance given by the men of South " 'Staffordshire that they disapprove the conduct of " 'the North Staffordshire men, and that they will " 'not assist them directly or indirectly during the " 'continuance of the present strike, it is hereby " 'resolved that the works in South Staffordshire " 'be re-opened this 5th day of April 1865. 5th " 'April 1865. Pursuant on the above resolution " 'these works are now declared open.' Notwith- " standing the pledges given both by the Gates- " head and the Brierley Hill unions, contributions " continued to be weekly received by the North " Staffordshire men from those districts, and towards " the end of the month of April communications " were received by the men from the executive " of the Brierley Hill union offering, in direct " violation of the assurances given by them to the " masters, to levy 2*s.* 6*d.* a week upon every member " of the union in aid of the North Staffordshire men " so long as the strike continued, and when the men " showed further symptoms of wishing to resume " work still higher offers of support were made by " the district secretary. In the beginning of May " the men made an offer to the masters to accept a " reduction of 6*d.*, which the masters at once de- " cidedly refused. From that time the men gradually " resumed work on the master's terms, and by the " beginning of June the strike may be considered to " have terminated, except at one or two works where " the men held out for some weeks longer, with the " view of inducing the masters to employ the men " who had made themselves conspicuous and ob- " noxious in preventing men who were desirous of " returning to their work from doing so. The

---

* The following is the form of agreement referred to:

Articles of agreement made this day of one thousand eight hundred and sixty-five between the several persons whose names are hereto signed on the first part of the schedule hereunder written, being ironmasters and smelters of iron in that part of the county of Stafford called the North Staffordshire iron district of the one part, and the persons whose names are hereto signed on the second part of the said schedule being puddlers lately working and employed at the ironworks in the said district of North Staffordshire of the other part.

Whereas disputes and differences have arisen and still subsist between the said several parties hereto respecting the amount of wages that should be paid by the said ironmasters to the said puddlers for each ton of iron puddled, and whereas in consequence of a reduction made in the wages the puddlers in the said district are and have been for some time on strike, and whereas since the commencement of such strike the said ironmasters have locked up their works, and whereas divers discussions have taken place between the said ironmasters and puddlers, at which the said puddlers have for various reasons assigned by them contended that no reduction of their wages should have been or ought to have been made, and at such discussions the said ironmasters have alleged their reasons for reducing the wages of the said puddlers, and whereas it has been agreed between the said ironmasters and puddlers to submit the matters in dispute as aforesaid to arbitration in manner herein-after mentioned, and it has been agreed that all the ironmasters in North Staffordshire shall re-open their works on the day of April instant, and that the said puddlers shall thenceforth discontinue their strike and resume their work at the said ironworks subject to the award of the arbitrators herein-after named as to the rate of wages per ton for puddling iron, and that the said ironmasters shall, until the said award shall be made, pay to the said puddlers weekly the sum of 40*s.* as a draw on account for puddled iron, and shall also pay any additional sum which the said arbitrators shall award within fourteen days after the said award shall be made: Now these presents witness, and it is hereby mutually agreed between the said several persons parties hereto, to refer and they do hereby refer all disputes and matters and things in difference between them respecting the said puddlers' rate of wages to the award, order, and determination of such persons as the Right Honorable the Earl of Lichfield shall name, with the consent of both parties hereto, or the major part of them, so that the award of the said arbitrators, or the major part of them, shall be published in writing signed by them ready to be delivered to the said parties on or before the day of next, or on or before any other day to which the said arbitrators, or the major part of them, shall by any writing signed by them from time to time enlarge the time for making the said award: And by the said award the said arbitrators, or the major part of them, shall determine the rate of wages per ton for puddled iron to which the said puddlers are and shall be justly entitled to receive from the said ironmasters, and the said parties hereto shall do all acts and things and produce all books, papers, and accounts as shall be necessary to enable the said arbitrators, or the major part of them, to make a just award between the said parties, and neither of them shall wilfully do or cause to be done any act to delay or prevent the said arbitrators in making their said award: And it is further agreed that the said parties hereto shall on their respective parts in all things stand to abide by and fulfil the said award. In witness whereof the said several parties to these presents have hereunto set their hands the day and year first herein written.

The schedule herein-before referred to.

First part.

William S. Roden (for Shelton Bar Iron Company and self).
Robert Heath Biddulph and Norton.
Joseph Bull and Son.
William Bates.
Stanier and Son (per William S. Nayler).

Second part.

(Men's names.)

" strike lasted about 20 weeks. The number of men " who were thrown out of work was more than four " times the number of the puddlers who were alone " the principals in the strike, and the loss to the dis- " trict was not less than a quarter of a million sterling, " so that each man on strike was the cause of de- " priving of employment at least four other persons, " and the distress caused throughout the neighbour- " hood may be inferred from the amount of the money " loss before mentioned."

10,568. (*Mr. Harrison.*) You say " each man on strike," does that refer to the men in North Staffordshire alone?—Yes, this is North Staffordshire alone.

10,569. And who were the four other persons?—The four other persons were people deprived of work in consequence of the puddlers not working.

10,570. In North Staffordshire?—In North Staffordshire.

10,571. This has nothing to do with South Staffordshire?—Nothing at all.

10,572. And does the quarter of a million refer to North Staffordshire?—Alone. And the injury to the district was much more than that, because having stopped our works practically for six months, we lost a great deal of the trade of the district, which of course went to other districts, and which we have never recovered.

10,573. (*Earl of Lichfield.*) With regard to the origin of this strike referred to at the beginning of your paper, you say, " In pursuance of the above " resolution notices for a reduction of wages were " given, expiring on the 14th day of January 1865. " While the notices were pending meetings of the " puddlers trades unions of the several iron districts " were held in South Staffordshire. The result of " their meetings as then communicated to the press " and the public was, that the men should accept the " reduction and no strike take place." I think we have been told, if I remember right, by the secretary of Brierley Hill executive that a decision against the strike was come to at the first meeting, but that another meeting was held immediately afterwards and that then they decided that the men in North Staffordshire should resist the reduction?—I believe that is the case. I heard that that was the case. I do not know how near the meetings were together, but the result was that the one meeting of course overruled the other. I do not know whether you like to hear opinions, but my firm conviction is that had it not been for the interference of the unions we should never have had a strike at all in North Staffordshire. I believe we are on as friendly terms with our men as the masters in any part of the kingdom, and they have told us since that it was purely owing to the interference of other districts with them, and that but for that they would never have dreamt of striking.

10,574. (*Chairman.*) Is there an amalgamation then of the unions of puddlers?—Yes.

10,575. And by reason of their belonging to an amalgamation of unions the other districts commanded the men in North Staffordshire to go out?—Yes.

10,576. And according to the best of your inquiry you mean to convey the idea that the majority of the North Staffordshire puddlers, if left to decide for themselves, would not have gone out?—In the first instance certainly they would not.

10,577. (*Earl of Lichfield.*) We have been told that the reason (at least the reason assigned by the Brierley Hill executive) for resisting the reduction was, that some of the masters in North Staffordshire had expressed their willingness to meet the men half way?—That was not true, they could not do so. It could not by any possibility be true, because we came to a resolution in connexion with that meeting at Birmingham, that we should reduce wages; therefore, we could not by any possibility have offered to meet the men half way.

10,578. (*Mr. Harrison.*) But what means had you of preventing a master from making any terms that he thought advantageous with his own people?—Simply the fact that we agreed on the terms.

10,579. (*Earl of Lichfield.*) The statement was made in answer to a question of mine. At No. 8790 in Mr. Hobson's evidence I say, " Will you explain " upon what grounds your association decided upon " supporting the resistance of the North Staffordshire " men to the reduction when they accepted it them- " selves in the South?" and his answer is, " They " were under the impression that the employers would " give way, in consequence of Mr. Bates, and a few " others, stating that they were willing to concede " the one-half to the men, while there were some of " the other employers who stated that another shilling " ought to be taken off; that, in fact, they were re- " ceiving a shilling more than they really ought to do, " and the members were under the impression that " the employers in North Staffordshire would allow " the men to commence working at only 6*d.* per ton " reduction, and the resolution went to say that it was " to test the masters in North Staffordshire whether " they would give way or not"?—There is not the slightest foundation for the statement that any of the masters in North Staffordshire expressed any opinion at all upon the question. It was agreed that a reduction of a shilling should take place throughout the country, and there was an end of the matter. There was no communication whatever with the men, and no master could communicate with the men after having agreed upon certain conditions.

10,580. (*Mr. Harrison.*) " No master could," you say?—It was not very likely that a man would agree to a thing one day and do the contrary the next.

10,581. That is precisely what the members of trades unions say, is it not?—How do you mean.

10,582. That the unions having agreed to strike for a certain rate, the individual members of the unions do not feel themselves at liberty to go in upon different terms?—Precisely. I consider trades unions in precisely the same condition as masters' associations.

10,583. (*Chairman.*) Only that the masters' associations are in defence?—The masters in this case were acting in defence.

10,584. (*Mr. Mathews.*) Is there not a stronger reason than the mere agreement between the masters themselves why the North Staffordshire ironmasters could not give the advance, namely, the low price of iron?—Of course; otherwise, in the first instance, they would not have attempted to lower the rate of wages.

10,585. If they had attempted to give a higher rate of wages, what would have been the result?—Of course they must have closed their works.

10,586. Did not the operations of the unions in North Staffordshire influence very considerably the decision of Mr. Bates to close his works?—The operations of the unions in North Staffordshire closed Mr. Bates's works altogether.

10,587. His men so plagued him, what with their stipulations, and what with insisting upon an advanced rate, that Mr. Bates could not stand against the pressure, and was obliged to stop his works?—Yes, that is the case.

10,588. (*Chairman.*) Were any other large works stopped in consequence of the calamity of that strike?—None but that stopped finally. That was a very large work.

10,589. (*Mr. Mathews.*) The general impression at that time was, if I remember right, that the unions considered that if they could succeed in supporting the North Staffordshire men on strike until the North Staffordshire masters gave way, then all the other districts which had accepted the reduction would immediately give notice to have the wages raised?—Yes.

10,590. Can you state upon what authority that report was founded, whether on printed documents or otherwise?—We had it from the newspapers.

10,591. (*Earl of Lichfield.*) Could the masters in North Staffordshire have continued to give a rate of

Mr. W. S. Roden.

29 Nov. 1867.

wages 10 per cent. higher than the rate of wages given in South Staffordshire?—Certainly not.

10,592. (*Chairman.*) That is to say, it was commercially impossible, if I may so say?—Practically impossible; we could not do it for long.

10,593. Unless you drew a cheque upon your bankers for the loss?—Yes, precisely. But then our make of iron is so heavy that it could very soon bring such a proceeding as that to an end.

10,594. (*Mr. Mathews.*) If the masters were in the habit of drawing cheques in the case of a loss, how long would the bankers continue to honour those cheques?—I should think that the funds would very soon come to an end.

10,595. (*Earl of Lichfield.*) Were there any acts of intimidation or outrage during the strike of the men in North Staffordshire?—Certainly on the whole we could not say there were. The men conducted themselves well throughout. There were one or two small attempts, but I do not hold the men responsible for them; they might have been the acts of individuals. Some iron, for instance, was put in the machinery to break the wheels.

10,596. In one case do you mean?—One or two cases occurred of that kind. I cannot say that the men were responsible for it.

10,597. (*Mr. Mathews.*) Was the district well provided with police during the whole of this strike?—Yes.

10,598. (*Earl of Lichfield.*) Was the machinery broken?—It was not broken. It was discovered before the works started.

10,599. Was not the strike prolonged in consequence of some of the masters refusing to take back men who had taken an active part in the strike?—The facts were these. After we had been out a certain length of time, about four months, we found that there were a certain number of men (not many) willing to go to work. We agreed that they should go to work, and the conditions they asked for were these, that if they were employed they should not be turned away again when the strike came to an end. We agreed that if they were employed they should have regular employment. At the time when the other men were willing to go to work, these men of course were being employed, and the first thing the other men did was to make a demand upon us to discharge these men. That we did not do. Then the whole of the men stayed out a week or two in consequence and prolonged the strike, but the result was that we kept our men on, and therefore there was so many of the other men who were not employed again.

10,600. (*Mr. Mathews.*) Was not it the fact that one of the firms in North Staffordshire was kept on by means of under-hands being substituted for puddlers?—Yes.

10,601. And was it not the case that towards the end of the strike the men said that they would not go to work unless all those under-hands were discharged?—Yes.

10,602. And the strike was prolonged for that reason?—Yes, that was another reason.

10,603. (*Mr. Harrison.*) What was the proportion of men in the union at the time?—It was understood that the whole of the puddlers were in union.

10,604. And of the other persons who were involved in the strike and lock-out, what proportion were in union?—A very small proportion. Some of the millmen were in another union, not the Brierley Hill union, but they had nothing to do with the strike. But that number is very small compared with the number thrown out of employment, because the majority of the men were in no union.

10,605. (*Earl of Lichfield.*) Did not the millmen continue to work during part of the strike?—I think that at first they did; we had a little stock of what we call puddle bars and they worked them up.

10,606. (*Mr. Mathews.*) When they had worked up the puddle bars they could not go on any longer?—We had no means of keeping them on.

10,607. (*Earl of Lichfield.*) They continued working as long as there was material for them to work?—Yes.

10,608. And took no part in the strike?—I believe they did not, but I am not quite sure about that.

10,609. (*Mr. Harrison.*) The terms upon which the works were closed throughout the kingdom were, that they should remain closed until the men in a certain district accepted a given rate of wages, were they not?—The terms are stated in the paper before you exactly, because that contains a copy of the resolution.

10,610. Will you explain it a little further. The Yorkshire and the South Staffordshire works were closed, not because the men refused to work for a particular price, and not because there was no work, but because certain men in the North Staffordshire district did not accept a certain rate of wages. That was the ground upon which the other works throughout the kingdom were stopped, was it not?—No. The ground on which they were stopped was this, that they decided that the North Staffordshire men should strike, and that they would support them in that strike. That was the reason that they were locked out. The view we took of the whole question was this, that North Staffordshire having agreed with the other districts to reduce wages, or rather to bring their wages to the same as the other districts, North Staffordshire being a small district, and there being very few masters there, was fixed upon by the men to, in plain English, fight the question. We of course had then to defend ourselves. We called upon the other two districts in pursuance of that resolution, to stop their works so as to avoid any subscriptions coming from those two districts to keep our men out. They did so. On the men of the first district, the North of England, agreeing that they would not subscribe, we said that we had no objection to their works being continued. The South Staffordshire men came to us in the same way, and we said that we had no objection to their going on on those terms. The subscriptions that were coming in for the support of the men then concentrated entirely upon North Staffordshire. It then became a question with us whether we should give way to the men and be ruined or not. We fought the question out, because we came to the conclusion that it was otherwise a hopeless case for us, and that if we did not get our work done at the same price as other people we should be ruined, and we determined to close our works for ever rather than go on on the terms demanded.

10,611. (*Sir E. W. Head.*) I understand you to mean that contributions came in from the other districts to help the men on strike in North Staffordshire, after there had been an understanding that no further interference was to take place?—Yes, that was the case.

10,612. That you have no doubt of?—Not the slightest.

10,613. So that the action was an underhand one?—Quite so.

10,614. (*Earl of Lichfield.*) I understand that no support was given from the funds of the union after the 4th of March, and from that time until the masters refused to take back into their employ some men in North Staffordshire who had taken an active part in the strike. You have told us that other men were put in their places, and that you refused to discharge those men?—Yes.

10,615. Can you tell us at all what number of men were taken on in the place of the old hands, in your own case for instance?—I cannot tell that exactly.

10,616. Did you in your case refuse to take back any man in your employ upon the ground of their having taken part in the strike?—They all took part in the strike.

10,617. But did you refuse to take any back upon the ground of their having taken part in the strike?—No, not upon that ground, because the whole of the puddlers equally took part in the strike, and one was quite the same as the other in that respect. But we declined to discharge those men that were already at

work, and that, of course, necessitated a certain number of these men going.

10,618. (*Mr. Harrison.*) You mean that no men were refused employment really substantially on the ground that they had been active promoters of the strike?—Well, with regard to the men who were employed, speaking of my own ironworks, although I manage them myself, and fix all the rates of wages, and do everything practically, yet I never interfere in any way with the special agents appointed for the different departments as to what men they shall employ. If they like to discharge men or to take them on, they do it without asking me.

10,619. Do you think it possible, then, that the agents may have refused employment to men on the ground that they had been promoters of a strike?—Not on that ground alone. They might from any reason refuse them employment.

10,620. Did they, as a fact, refuse employment to those who had been prominent in the strike?—There were some of the men who had taken part in endeavouring to deter others from coming to work, and those men, I believe, were refused employment.

10,621. (*Earl of Lichfield.*) Do you consider that the masters would have been justified, after the men had been on strike for this length of time, and after having been put to this very great loss in consequence, in refusing to take back to their employ men who had taken the lead in this strike?—I consider that the masters would have been justified in refusing anybody they pleased. Men are free to work where they like, and masters are free to take whom they like.

10,622. (*Mr. Harrison.*) Do you think that the puddlers, as a body, would have been justified in refusing to work on any terms for a master who had taken a prominent part in this lock-out?—They are perfectly justified in refusing to work or in agreeing to work anywhere they think proper with or without reason.

10,623. (*Mr. Mathews.*) If the workmen refused to work for a master under those circumstances, there would be no expostulation on the part of the master?—No.

10,624. In fact the contract between them would terminate then?—Yes.

10,625. Both parties are perfectly free to adopt what policy they like?—Quite so.

10,626. (*Chairman.*) Do I rightly understand you to say that there has not been the same good feeling between the men and the masters, not such a confidential relationship as there used to be?—There has not, since the interference of the trade unions, but I believe that that kindly feeling is coming back again into its old place.

10,627. I understood you to say that the men of the trades unions behaved in a manner that you see no reason to censure at all?—In the way of any acts of violence or anything of that kind, I meant.

10,628. Assuming that the masters have a right to hire whom they please, and that the men have a right to accept hire where they please, both parties met on those terms, and the man pursued the same course as the masters, each for their own interest?—I consider that, looking at the circumstances of the case, the long time that the men were out of work, and the great distress that was caused by their determination to stick to what they thought right, the peaceable state of the district was perfectly wonderful; there was not one single act of outrage.

10,629. In your opinion has that strike had any effect upon the amount of capital brought into the trade there; has there been an unwillingness on the part of capitalists to invest in the trade?—Most certainly, there has not been anything invested since.

10,630. And have foreign manufacturers had an advantage by reason of the check to investment in North Staffordshire?—Very great indeed. I might say that I am thoroughly well informed of the state of trade with regard to England and other countries. I happened to be one of the jurors at the Paris Exhibition representing England for mining and metallurgy; therefore, I had an opportunity of gaining information from every district and country, not only as to the cost of production, but as to the rate of wages and the quality of iron they produced, and everything else, and I know that it was entirely in consequence of the strike in North Staffordshire, and the consequent lock-out in the districts of England, that Belgium had such a lead of us. They went in immediately that the works were stopped in England and took orders for enormous quantities, far more than they could execute, and we have not yet succeeded in getting that back. Indeed, my works at present are working three days a week only, and have been working only three days or four days a week for months. I have no hesitation in saying that, had it not been for the North Staffordshire strike, we should have been practically in full work up to the present time.

10,631. You think that the change of terms between the masters and the men has really operated upon the prosperity of the district?—Very much indeed in the way of retarding it.

10,632. The majority of the men seem to me, from what you say, to have entitled themselves to respect and good feeling?—By their personal conduct, most certainly.

10,633. Were there men on this occasion who were fomenters of disturbance, as one would say?—Yes, no doubt of it.

10,634. Whether in reference to union men or an ordinary establishment, has it been your experience that in a very large number of men there are some that are, if I may use the term, ill-conditioned men?—Yes.

10,635. Making bad worse whenever there is an opportunity?—Yes.

10,636. Servants of the Power of Evil?—Yes.

10,637. And when you have an opportunity to weed does your eye rest upon those men as the first weeds to be pulled up?—Naturally it is so.

10,638. And that whether there is an union or an ordinary large establishment only?—Yes.

10,639. (*Mr. Booth.*) Did I rightly understand you in speaking of the conduct of the men on strike to represent that they interposed no obstacles to your getting labour from other sources?—Well, I could not say that.

10,640. Did they leave you perfectly free to engage such other men as you would?—I will not say that quite, but there was no actual violence or outrage.

16,641. (*Sir E. W. Head.*) Were there any attempts made by you to get men from other places?—Yes.

10,642. And as far as you know is it the case that those attempts were not interfered with by active violence on the part of the union?—Not by active violence, certainly.

10,643. (*Mr. Mathews.*) Was there nor a general apprehension on the part of the people invited into the district that it was rather hazardous for them to come?—No doubt, and that was the reason why they did not come.

10,644. (*Mr. Booth.*) In fact you did experience a difficulty in getting other hands to supply the place of those out on strike?—It was an impossibility, not merely a difficulty.

10,645. (*Mr. Harrison.*) If you attribute in so great a degree the depressed state of the Staffordshire iron trade to the strike and unionism, how do you account for this, that we were told yesterday by Mr. Clark, the manager of the great Dowlais Works, that he has been unable to make any profit there, he not having been affected by any strike or any unionism for a great many years past, it being a thing utterly unknown in that part of the country?—Well, I managed an ironwork in Wales for nearly 10 years, one of the largest next to the Dowlais Works, so that I know the district perfectly and all about it, but I do not exactly understand your question.

10,646. You say that a large portion of the depression of the North Staffordshire trade is due to the action of unions, that the North Staffordshire trade

Mr. W. S. Roden.

29 Nov. 1867.

went into Belgian hands, and that that was caused by unions and unionism?—Yes.

10,647. How do you account then for this, that Mr. Clark, at the Dowlais Works, where they have had no unionism and no strike, as well as a great many other ironworks in the kingdom where there has been no unionism and no strike, did not take that business instead of the Belgian people from you?—The reason is that they cannot in Wales make the sort of iron that was required.

10,648. You mean that the particular markets which you were supplying if not supplied by you could only be supplied from Belgium?—They could not have been supplied from Wales. They only make a special sort of iron in Wales, and they cannot make the quality of iron that we make in Staffordshire. They cannot make iron for certain purposes which the Belgians can.

10,649. (*Sir E. W. Head.*) Can you state more specifically the markets into which you think that the Belgian iron took that opportunity of thrusting itself?—Yes; Russia, France, and Germany.

10,650. (*Mr. Hughes.*) In what year was the trade thus turned into Russia and other countries?—During our strike in 1865.

10,651. (*Chairman.*) Instantly Belgium came into the market for that class of iron?—Yes.

10,652. If a trade has begun to flow in a certain course is it, according to your experience, that it would continue in that course until some obstacle or other came to cause a change?—Most certainly.

10,653. If it turned from Staffordshire into Belgium it would continue in Belgium until some obstacle in Belgium made that course of trade cease there?—Certainly; but it could be returned to England again if we were placed in a position to compete with them.

10,654. That is to say, if you could offer more favourable terms?—Precisely, if we could produce our iron cheaper.

10,655. (*Earl of Lichfield.*) Can you account for the circumstance that the export of iron increased largely in the year 1866 as compared with the exportation in the year 1865?—I happened to be here yesterday when the subject was alluded to. The reasons are obvious. The returns, I take it, are made up to September 1866. The iron that was so sent out was ordered possibly six months previously, and therefore it could not have affected the returns for that year, but when we have the returns for this year you will see the difference. But even apart from that, any increase of the amount exported is no proof at all of the extent of the trade of the country. On the contrary it is a proof of the badness of the trade in England frequently. If we cannot sell our iron for home consumption we are obliged to send it to any market we can.

10,656. (*Mr. Merivale.*) Do you really carry it so far as to say that the more we export the worse we are off?—I am speaking of this year, 1866. The facts of the case are these, that the ironworks are only on half employment now, and that in that year they were in full employment, and that the home trade is completely gone. I believe that since the panic no ships have been built.

10,657. You have no statistics to show the fact of the home trade being gone, it is a matter of opinion?—No, it is not a matter of opinion, it is a matter of fact.

10,658. You have no test of that fact?—Except that the English works are only now working half their time.

10,659. (*Earl of Lichfield.*) And that no railroads are being made?—No railroads are being made and no ships are being built.

10,660. (*Mr. Harrison.*) Do not you think that the small demand for iron is sufficient to account for the depression of trade without putting it upon unionism and strikes?—No, certainly not. If we find that Belgium comes into our markets and beats us in cheapness of production, and we are compelled to give a high rate of wages through the action of unions, the small demand will not make the difference.

10,661. You know the work turned out at Creusot, probably?—Yes.

10,662. What kinds of work are done there?—All kinds.

10,663. Is it of a high quality?—They make all kinds, high and low.

10,664. How do you account for this fact, which we have had stated by a gentleman who is commissioned by the American Government to make certain inquiries, and who gave evidence here, that the works of Creusot are turning out large quantities of the very best work, both machinery and iron work and rails, that they have no unionism and no strikes to deal with, that wages are extremely low, and that they are now making no profit?—I am not at all aware that that is the fact. At far as my experience goes I believe that they are making a profit. It may not be a very large one just at the present time, but I know the circumstances of those works very well, and it is my impression that they are making a profit.

10,665. I will put it in this way. If the depressed state of the iron trade in England is caused not so much by a depression in the demand, or a reduced demand for the work, but by the high rates of wages which are insisted upon by the unions of the men, how is it that the French works, which can produce the best work and where the wages are very much lower than in England, do not take away that trade?—Well, they can of course only make iron up to their capabilities.

10,666. But would you be surprised if I were to say that, according to the best information that we can get, they are not working at a profit at Creusot?—Well, I am under the impression that they are; but admitting that they are not working at a profit at the present moment, on the other hand we might admit that the English ironmasters are working to a positive loss. It is a mere question of degree.

10,667. In point of fact, the reduced demand for iron is felt all over the world at the present moment?—No doubt.

10,668. Puddlers and millmen and so forth are paid by the piece in your works, by the ton, I presume?—Yes.

10,669. Taking the puddling of two tons of iron of precisely the same quality out of the same quantity of pig-iron as the raw material, supposing A. and B. to be two puddlers working side by side, they are paid the same rate per ton, are they not?—Per ton of iron puddled? Yes.

10,670. Then there is no ground whatever in the iron trade for saying that the union or any combination of men practically enforce a greater uniformity in the rates of wages than would be the case if things were left to their natural course? I mean without regard to the individual skill of the workmen?—That is the very effect of unions.

10,671. How does that operate in the iron trade?—It puts a bad workman on the same terms as a good one.

10,672. If men are paid by the ton, and a fixed material is given out to them, and a measured quantity is required from them, and you make no difficulty about paying two men the same amount for the same quantity, how can you further proportion wages to skill?—But we do not do that. We deliver to them the same quantity, but we do not get back the same quantity. A good workman would produce considerably more than a bad one. As a matter of fact, they do not produce the same quantity, nor are they required to do so, because it would be a matter of impossibility.

10,673. Then they are not paid for the same quantity?—I will put it to you in this way. We deliver out, say 24 cwt. of pig-iron, which is about the average quantity; a good puddler will bring out perhaps 22½ cwt. we will say, while a bad puddler will only bring out 21½ cwt. We pay the same price per ton for the two on the quantity turned out, but the bad

puddler wastes for us that 1 cwt. of iron, which comes to considerably more than the difference in wages. The iron perhaps would be worth 3*l.* a ton, and the wages are 8*s.* 6*d.* a ton, consequently we lose that difference. By the action of trades unions we are compelled to pay those men the same rate of wage.

10,674. Are the men now in your works members of the union ?—I do not think they are now.

10,675. Are you aware whether at the works at Creusot, for instance, where there is no union, men are paid at a uniform rate per ton, the material being the same, or wheher their wages are graduated according to the indtividual's skill, so that A. for a ton of puddled iron receives 8 francs, B. receives 7 francs C. receives 6 francs, and so on ?—I believe that they have different rates of wages there.

10,676. Mr. Hewitt, the American Commissioner, who has personally examined those works, has told us that they were all paid by the day, and that the graduation of wages with reference to skill was greater in England than it is in France ?—Mr. Hewitt does not know the English iron trade at all. I know him very well, and he comes here casually and gets information, but he is not practically acquainted with the English iron trade at all. He went to Creusot, but he has not been to the English ironworks to get information on the subject.

10,677. You do not doubt that a puddler at Creusot is paid by the day, do you ?—I believe that they pay them by the day.

10,678. If a man is paid a uniform rate per day, that surely is a less exact manner of proportioning wages to skill, is it not, than if a man is paid at so much a ton, and it is measured ?—No, certainly not ; there is the value of the article which he is to deal with to be taken into consideration. If we can get a saving in our materials or in our iron, we can afford to pay a higher rate of wages. If that iron is, on the contrary wasted, we cannot afford to pay a higher rate of wages.

10,679. If A. B. and C. at Creusot are paid 8 francs a day for their labour, without reference to quantity, and in England A. B. and C. are paid at so much per ton, their earnings being measured by the quantity which they produce, skill has the advantage in England as compared with Creusot, has it not ?—If one man produces 22½ cwt., and another produces 21½ cwt., certainly the man who produces 22½ cwt. is paid more than the man who produces 21½, but then the latter is not economically so valuable as the former, because he wastes a large quantity of iron.

10,680. (*Sir E. W. Head.*) Is it certain that the men at Creusot, though paid by the day, are all paid the same rate per day ?—No, they are not ; there is an extensive graduation.

10,681. (*Mr. Harrison.*) Mr. Hewitt says that there is more discrimination in England than in France ?—That is not so. Their works are managed much closer than ours are.

10,682. Can you produce us the figures ?—I cannot produce them ; mine is merely information the same as Mr. Hewitt had there, namely, from the manager at Creusot. He said that they paid different scales of wages.

10,683. (*Chairman.*) If a gentleman, having no particular business relation, asks a partner in very large works what profit he is making, is it usual to disclose it ?—Sometimes it is done, because some men are more candid than others ; but that question cannot be answered at the present time.

10,684. Supposing that Mr. Hewitt called at the works as a traveller, and asked the junior partner what profit he was making, and that the junior partner said, "We are not making any profit now," should you consider that he would be blameable in any particular degree if you found that he was making two per cent.? What he called no profit might mean no profit worth speaking of ?—That might be the meaning.

10,685. If a stranger asked the manager of a concern in England how he was getting on, the answer would be, I suppose, "Pretty well, I thank you," or else "Not very well ?"—Yes.

10,686. There it is, and it is available for what it is worth. Mr. Hewitt called upon the junior partner, and he said, "We are not making any profit now ?"—Yes ; and I think that travellers going about in that sort of way would hardly get precise information.

10,687. (*Mr. Hughes.*) I suppose Mr. Hewitt would be able to get as precise information as you, would he not ?—It would depend on circumstances.

10,688. (*Chairman.*) A man buying and selling would be likely to have correct information about the line of business that he was interested in, I presume ?—Yes ; but I do not think that people would be likely to show him their balance sheets.

10,689. (*Mr. Hughes.*) Have you paid attention to this question of the Belgian competition ?—Yes, I am sorry to say that I have been forced to pay attention to it.

10,690. You say that you think it was in 1865 that the Belgian competition became formidable ?—Yes.

10,691. Are you aware what the gross produce of all the Belgian iron fields was in 1866 ?—I have not that here, but I have it at home.

10,692. According to Messrs. Creed and Williams it is 392,000 tons. Would that be a formidable item as compared with the English trade ?—Very, in that particular class of iron.

10,693. But that is the whole amount ; do you know what the gross produce of England is as compared with Belgium ?—Of course it is very much larger.

10,694 I am trying to contrast the size of the Belgian iron fields with our own. When one comes really to look at the gross produce of the Belgian fields, the whole of their fields together are not so big as one of our great fields ?—I will explain the thing. They make a special character of iron in Belgium, and the total make of England is no criterion at all. The bulk of the make of England, of course, consists in great quantities of pig-iron. Now in Belgium it is all manufactured iron, and all manufactured iron of a particular class, the same class as we make in Staffordshire.

10,695. But supposing the whole of their produce to be of that particular class, it would scarcely be formidable in comparison with the iron trade of England surely ?—Very formidable indeed with regard to the same quality of iron in England. The proportion of the number of tons of iron made in each country is no criterion at all. I am speaking of a special quality. They interfered with our North Staffordshire trade by making the same quality of iron as we made. We have lost the trade which we had and have never recovered it since.

10,696. Where have they superseded you ?—They have superseded us everywhere ; they even sent to America. In every foreign market that we had we have been competed with by the Belgians.

10,697. So that they manage with this very small comparative production, which does not amount to above a twelfth of the English production, to meet you in every market ?—Yes ; it amounts to very much more than a twelfth of the English production of the same character of iron.

10,698. (*Mr. Harrison.*) What are the centres of the trade in England which compete directly with your particular branch in England ?—They make something of the same character of iron in the Middlesbro' district, the Cleveland district as it is called, and in Derbyshire. None of the Welsh compete with us and scarcely any of the Scotch. But I will mention a case which is an absolute fact. The other day I tendered for a quantity of iron in London, about a thousand tons of what are called "girders," and the other English ironmasters tendered too (it was for girders for St. Thomas's hospital). The whole of that iron was bought in Belgium.

10,699. (*Mr. Merivale.*) The Belgians beat not only you, but the ironmasters in the other districts of England too ?—Yes.

Mr. W. S. Roden.

29 Nov. 1867.

10,700. Though these last have no workmens' unions? —In the north of England they have.

10,701. (*Earl of Lichfield.*) Is that a quality of iron that can be produced in Wales?—No, it cannot be produced in Wales.

10,702. (*Mr. Mathews.*) It is plate-iron?—Yes.

10,703. Not only do they make plate-iron cheaper, but they have cheaper labour and send the girders ready manufactured here?—Yes.

10,704. (*Mr. Hughes.*) Do you agree with Messrs. Creed and Williams that the Belgian iron is uncertain in quality and inferior to ours?—It is rather a wide question. Thay make different qualities of iron in Belgium, no doubt.

10,705. Do you know the book published by Messrs. Creed and Williams?—Yes.

10,706. They state that "the Belgian merchant iron "generally is at present uncertain and irregular in "quality;" do you agree with that?—No, that is not the case now. It was so, but they have improved.

10,707. Are they equal to us now in that respect? —Yes.

10,708. (*Sir E. W. Head.*) Have you any statistics to show the increase of the Belgian exports in iron to Russia, France, and Germany after the lock-out in Staffordshire in 1865?—No.

10,709. It would be desirable to have such statistics as would show that the quality of the iron was a quality competing with our iron?—I have just mentioned a case in point, where a lot of girders to be used in London were bought in Belgium within the last month.

10,710. (*Earl of Lichfield.*) In referring to the effect of the North Staffordshire strike upon the iron trade generally I think I rightly understood you to say that the effect it had was in consequence of the high rate of wages required by the men. Now I think there must be some mistake there, because the result of the strike was that the men did not obtain the high rate of wages that they asked for. Do you not rather mean that the length of time the works were closed so deranged the trade that masters here were unable to accept contracts which they otherwise would have accepted?—Certainly.

10,711. (*Sir E. W. Head.*) It was in fact because the North Staffordshire masters had their hands tied at that time?—Quite so. I was speaking of the present time when I said that the high rate of wages prevented our competing with the Belgians and not of that particular time. We lost our trade then because our works were standing. It was not then a question of price, but at the present time it is the high rate of wages that prevent us from competing with Belgium.

10,712. If I understand you rightly you look upon the transfer of this Belgian iron to these foreign markets as important not so much in reference to the actual quantity sent, but because it is the stream flowing that way?—Yes.

10,713. And because it is the commencement of a larger trade?—Yes.

10,714. (*Mr. Mathews.*) Though the amount of Belgian iron imported here may be small it regulates the price in the English market?—Yes, it regulates the price to a certain extent, though it may be a small quantity.

10,715. (*Mr. Merivale.*) You say that the Belgians have beaten both yourselves and the Clevelanders, as I understand you?—Yes.

10,716. You attribute your own defeat to the operation of the unions?—Yes.

10,717. To what do you attribute the defeat of the Clevelanders?—To the same thing.

10,718. (*Mr. Hughes.*) Do you not think, if you know the Belgian trade, that there are other causes besides the rate of wages which account for their beating the English producers?—There might be some other causes, but the wages alone are a sufficient cause I think.

10,719. Are you aware to whom the minerals in Belgium belong?—To the government.

10,720. Do you know anything of the rates there? —Yes, they are low.

10,721. Low as compared with the English?—Yes, very much lower.

10,722. Surely that circumstance by enabling more production is a more direct cause of the Belgians getting our trade from us?—Of course it is one cause, but it is not a sufficient cause.

10,723. You think that if the figures were taken out that cause would have less effect upon the cost at which the Belgians can sell than the other cause which you have mentioned?—I think so, certainly.

10,724. (*Mr. Mathews.*) If the rate of royalty there were 50 per cent. lower than in England that would not be equivalent to the rate of wages being 30 per cent. lower than in England?—Certainly not.

10,725. Inasmuch as the cost of a ton of iron in wages is infinitely greater than the cost of the royalty? —Yes; there is no comparison at all between the two.

10,726. (*Earl of Lichfield.*) What is your opinion of the system under which the rate of wages is made dependent on the price of iron according to the Staffordshire scale?—There are two ways of looking at the question; the one is to have a fixed rate of wages, no matter what the fluctuations of trade may be, the other is to establish, practically, a partnership between the workman and the employer, and regulate the wages in accordance with the price received for the iron, so that the workman should always receive (and that is the principle which they have hitherto gone on in Staffordshire) a certain proportion of the price that the master receives.

10,727. But is it your opinion that that system has worked satisfactorily hitherto?—On the whole it has.

10,728. (*Sir E. W. Head.*) Where has it been adopted?—It is adopted in Staffordshire now.

10,729. (*Mr. Mathews.*) Would it be practicable in point of fact to adopt any other system. If the price of iron were to go up would not the workmen say, notwithstanding any compact or any bargain, "We will not work for so low wages as we have "been receiving?"—Yes.

10,730. And if the price were to go down so much would not the masters say, "We cannot employ men "at these wages, or else we must stop our works?"— Yes.

10,731. (*Mr. Harrison.*) The sliding scale according to which wages are regulated by the selling price of the goods is not one which is proportionate to the profit of the master, or to the state of the labour market, or to the amount of the goods produced?—It is so practically; it works out so.

10,732. I will put it in this way. When the price of the goods (speaking in the abstract and not with special reference to iron) is low, there may be a very large production and a very large consumption of those goods, and very high profits; then of course by the system of a sliding scale wages would be low; again, there may be the same great consumption of the goods, a great demand for labour, in other words great scarcity of labour, men being very difficult to come at, and very much wanted, notwithstanding that, the wages according to the sliding scale would be low, although by the rules of ordinary markets they necessarily would rise from the state of the labour market. All those are anomalies, are they not, when wages are fixed by a sliding scale relating to the price of the goods sold and not to the state of the labour market, or to the state of the sale market, or even to the profits of the manufacturer?—Certainly not; those causes act and react on each other. When prices are low there may no doubt be a large consumption, but there cannot be high profits.

10,733. Not in the iron trade?—Not in the iron trade.

10,734. There are in other trades, are there not?— Not that I know of.

10,735. The price of goods may have descended, over 10 years, down to a half, having kept on continually falling, and the profits of the manufacture may have been rising all the while, may they not?—

I will put it in this way. You say, "Large consumption and high profits." Now, those profits would naturally raise the rate of labour, the demand for labour would naturally increase, and the rate of wages would naturally rise.

10,736. That is to say, the rate of wages would not be governed by the sliding scale, but by the ordinary rules of the market?—But the sliding scale is simply a record of the ordinary rules of the market. The real selling price is ascertained first and then the price is fixed. The rate of wages is fixed upon the price of iron, not the price of iron upon the rate of wages.

10,737. In that case the rate of wages is fixed not by the actual market or the demand for the men's labour, but by the price at which certain goods are sold?—But in the iron trade it amounts to exactly the same thing. During high prices there is a greater demand for labour, and when prices are low there is a less demand for labour, as a matter of course.

10,738. Is it always the case that when prices are high there is a great demand for labour?—Yes.

10,739. Supposing that the labour market is from other causes thinned at the same time?—It makes it higher then.

10,740. But the sliding scale interferes with the operation, does it not?—The sliding scale is simply a record of the absolute state of the facts at the time.

10,741. (*Mr. Hughes.*) Do you consider the wages system in Belgium in a satisfactory state so far as you know it?—Do you mean to ask whether I think that the men are getting sufficient wages?

10,742. No; I speak of the relations as to wages between employers and employed.—They seem to me to be satisfactory.

10,743. Are you not aware that in 1861 the troops were called out in Belgium, and there was a great deal of bloodshed before the wages question was settled?—I was aware that there was a disturbance, but it was a small matter.

10,744. Mr. Herries says, "This strike was followed "by a disturbance of so serious a nature that troops "were called out, and the riots were not finally sup- "pressed without deplorable conflicts and bloodshed." That was in 1861. Are you aware whether last year the troops were called out?—It is usual to call the troops out on slight provocation on the continent.

10,745. Are you aware that they were as a fact?—I believe that they were.

10,746. If there had been an organization for settling wages between employers and employed, is it not very probable that the question might have been settled without calling out the troops?—I think not; I think it is merely the custom of the country.

10,747. Have you ever known any instance in England in which troops have been called out during a strike, because within the last six years, in Belgium, we have two well-authenticated instances in which the troops have been called out to settle the wages question?—To prevent disturbances.

10,748. What did the men turn out for last year in Belgium?—They objected to have their wages reduced.

10,749. And the troops were called out in consequence of the riots which occurred?—Yes, I suppose so.

10,750. Has there been any instance of that kind in England during the last six years, in which the unions have been so strong as to require to be put down by troops?—There has been no instance of it, practically, within my memory, even including the time when there were no unions at all in the iron trade.

10,751. Is it not possible that the organization of unions may have the effect of keeping away from us a worse state of things?—No, I do not think that the Belgian question bears upon the English question in the slightest degree.

10,752. We have there an instance of labour entirely unorganized?—I am not informed of that altogether.

10,753. Are there unions then in Belgium?—There are combinations, I believe, amongst the workmen from time to time.

10,754. I take your statement (and it is the statement of Messrs. Creed and Williams at any rate) that the absence of unions in Belgium is one of the great causes enabling them to undersell us. The case of Messrs. Creed and Williams is that our unions are ruining our trade, and they cite Belgium and say that there are no unions there, and that they are beating us?—I believe that there are no unions there now.

10,755. So far as you know, and so far as I know, labour is unorganized in Belgium?—Yes.

10,756. Labour there being unorganized, in two cases within the last six years the troops have been called out to, I will say, interfere in questions of wages?—Yes, to prevent disturbances.

10,757. That has not been so in England?—It has not been so in England.

10,758. Is it not possible that the organization of labour in England may have had some effect in producing that better state of things?—No, I think not.

10,759. (*Mr. Mathews.*) If there had been as efficient a police in Belgium as there is in England would there have been any occasion for calling out the military there?—I think not.

10,760. (*Mr. Booth.*) Should you think it an advantage to the workmen in Belgium if by organization, such as exists in this country, they were to succeed in ruining the iron trade in Belgium?—Certainly not, quite the contrary; it would be very detrimental to themselves and to the country.

10,761. (*Earl of Lichfield.*) Do you think that if the usual custom of reducing wages immediately upon a reduction in the price of iron taking place had been adopted by the masters in 1864 there would have been the same probability of a strike as there appears to have been when the masters delayed reducing the wages for six months after the reduction had taken place in the price of iron?—I do not quite follow the question.

10,762. You are aware that the price of iron fell six months before the notice was given for a reduction in the price of wages?—Yes, the nominal price of iron was reduced before.

10,763. Supposing that the reduction in the wages had taken place immediately upon the fall in the price of iron, do you think that there would have been the same probability of the men striking?—I cannot exactly say. I do not think there would.

10,764. In short that strike may be partly attributable to the fact of the usual custom not having been carried out in that case?—Certainly; my own impression is to that effect. I do not know whether it is the opinion of the trade, but I always considered that the prices of iron should be lowered or raised, and the prices of wages lowered or raised simultaneously.

10,765. (*Mr. Harrison.*) Without reference to the number of men who are competing for the work do you mean?—The price of iron; the absolute good trade or bad trade regulates that matter.

10,766. I will put to you two cases. I will allow that they are somewhat extreme cases, but they will show the principle. You say that the price of iron is fixed first. That is determined largely, is it not, by foreign competition which you have to meet?—That is everything.

10,767. Upon that, by the system of the sliding scale, the wages rise or fall in accordance with that declared price?—Yes.

10,768. Now the first of the two cases which I will assume is this: there is an immense and sudden developement of the iron trade in America, consequent, say upon some peculiar state of things in America, and 1,000 puddlers are drawn off from, say the Staffordshire district to America to meet this demand for their labour; but no difference having taken place in the price of iron at home, wages will still remain unaffected by that very great difference in the labour market in Staffordshire. Again, take this case, those 1,000 puddlers say upon the breaking out of the war (it would be upon the cessation of the war in the case of America) returned home again to Staffordshire and flood the Staffordshire market; prices of

Mr. W. S. Roden.

29 Nov. 1867.

iron not varying, wages remain at the same point; notwithstanding that the labour market is flooded, they do not fall. That being the case, the sliding scale regulates wages without any reference to the actual state of the labour market?—No, it does not do so; because it is not a fact that if a thousand puddlers were withdrawn from the country the price of iron would remain the same. If you reduce your production of iron, you necessarily increase the price of the iron that is produced.

10,769. Belgium and France not being affected, and being able to produce at the same low rates as before, you would not have a market?—To the extent that you lessened your make you would. Supposing, for instance, that you make 100,000 tons, and that you take away 20,000 tons from that, you get a higher price for your 80,000 tons.

10,770. All that is very indirect, is it not, whereas the operation upon the labour market is immediate?—No, the rise of iron is quite as direct, they act together. Moreover, I must remind you that in your question you have assumed to some extent that the price of iron is a price fixed by the ironmasters themselves, whereas the rise is really regulated by what we can get. We find out what we can get and fix our wages on that price.

10,771. (*Earl of Lichfield.*) What is your opinion as to the rate of wages of puddlers and millmen? We were told yesterday by Mr. Smith that he considered that the rate of wages paid to the millmen was too high in proportion to the wages of the puddlers. Do you agree with him in that opinion?—No, I certainly do not agree with him on the broad principle. If he mentioned certain men among the millmen who are paid too high, I believe that they are paid too high in proportion to what they fairly earn in comparison with the puddlers work, but those men are very few in number, perhaps one man out of every 20. We give out work as a kind of contract to this one man who farms it as it were, and gets his labour as cheap as he can, and no doubt in consequence of the improvement of machinery and many other things (of course there is increased intelligence on all sides), he can get his work done cheaper than he could when those prices were fixed; and as there has been no technical arrangement of prices, as between different classes for many years, there is no doubt that those men are getting too high a rate of wages, and that therefore it would be fair, if there was an advance of wages given, that they should have a less advance, and that if a reduction of wages took place, they should have a greater reduction than the other men. But, as I say, those men are few in number, and the term "millmen" does not apply to them, I mean that they would constitute only one out of every 10 or 20, or something of that kind. I quite agree with Mr. Smith that those men get too high wages, but they are few in number.

10,772. Do you agree with him in thinking that the wages of puddlers should not fall below 8*s.* 6*d.*?—To answer that I might state, that when we pay the highest rate of wages we get the highest prices, and that it is very much better for us to pay a higher rate of wages, because we get more in proportion for our iron than we do when it is low. We lose by every reduction that is made in the price of iron, because we cannot get anything like the same reduction in wages.

10,773. (*Mr. Mathews.*) You would prefer to see such a state of the iron trade as would justify a high rate to the puddlers?—Yes, it is our interest to pay as high wages as we can in proportion to the cost of production. The higher the rate which the iron is selling at the more profit we get.

10,774. Take a ton of bar iron selling at 6*l.* 10*s.*, what proportion of that consists of wages paid for labour, and what proportion of royalties and other fixed matters of which the prices do not vary. Have you considered that question?—I have considered it. It varies in different districts. But to illustrate the thing you must take those districts where the ironmaster raises his own coal.

10,775. I assume such a case in my question?—Where he does everything himself within himself, the proportion paid for labour would be perhaps 80 to 90 per cent., perhaps 85 per cent.

10,776. There or thereabouts?—Yes.

10,777. Varying more or less according to the circumstances of the particular works?—Quite so.

10,778. (*Mr. Harrison.*) Would that 85 per cent. represent the weekly wages which he himself paid and which would rise or fall with a change in the price of iron?—I think that 80 per cent. certainly would. There are certain fixed charges of course, for agencies and things of that kind, which may not be altered at that particular time. When prices get high, however, practically we have to advance that kind of labour as well. It may not be advanced at the same time as what we call the workmen's labour, but when trade is good and prices high we are obliged either to directly advance our clerks, book-keepers, and agents generally, or to make them allowances during the period that the trade is good. Therefore, it affects us somewhat in their case, but not to any such extent as in the case of the workmen.

10,779. (*Mr. Mathews.*) Reverting to the strike in North Staffordshire, I think you state that there were contributions from the other districts to those men?—Yes.

10,780. Were not there contributions also from the London trades unions?—Yes.

10,781. And did not some men come down from the London trades unions to those men to exhort those men to remain out, and promised them support if they remained out?—Yes.

10,782. And that had a tendency to continue the strike for a much longer period than it would have continued but for that intervention?—Yes.

10,783. (*Mr. Hughes.*) You said that the higher the rate you get for the iron the more profit you get?—I think I said that when prices were high the rate of wages did not bear so great a proportion to the cost of iron as it did when they were low.

10,784. That I imagine comes to the same thing. If the men knew that, would not that perhaps account for what was stated by Mr. Smith yesterday, their struggle to increase the rate of their wages as the prices of iron got up. You remember he told us that in August and September 1863, there was a great rise in the price of iron and that the men strove for and obtained an advance of 6*d.*, in fact they got three advantages of 6*d.* as he put it. Now, if the masters got more profits could they not afford to pay a higher rate?—Precisely, and they would be glad to do so.

10,785. And that was the reason why they gave in, I suppose?—No, the facts of the case were these. The price of iron had not risen, but the works were better employed than they had been, and the men considered that it was a very good time to attempt a rise in the price of wages, and they struck. In the meantime trade had greatly improved, and people who were making the commoner qualities of iron, not the qualities with the regulated price, were getting higher prices and nearer to the list prices. At last the ironmasters of South Staffordshire found that they could get an advance of a pound a ton, and consequently that improvement in the trade brought about an advance in wages.

10,786. There was a rise up to 8*l.* a ton in September?—Yes.

10,787. Then the men got another advantage, that is to say, they got 9*s.* 6*d.*, whereas according to the scale they should only have had 9*s.*?—No, 8*s.* 6*d.*

10,788. It was 8*s.* 6*d.* in August, and in September they got another 6*d.* At any rate be it two or three sixpences, would it not probably be a reason for the men thinking that they should get a higher rate of wages if they knew that the rate of profit of the master was decidedly greater as the price of iron rose?—But the price of iron had not risen when they struck.

10,789. I do not care about the particular circumstances of this case. We have got this fact, that when

iron rises up to a certain point (it seems to me above 7*l.* 10*s.*) then the men begin to struggle for more than the scale; they struggle for 6*d.* in every 10*s.* ?—That was not exactly the way in which it was brought about.

10,790. The scale, as I understand, is one ranging in all ordinary times on this principle, a shilling to the puddler for every 1*l.* to the master ?—It is so.

10,791. Then on certain occasions we find from the evidence yesterday, that when iron got high, when it got above 7*l.* 10*s.* 0*d.*, the men instead of putting up with this shilling strove for an extra 6*d.*; as Mr. Smith said they got three sixpences which they had no right to ?—The first advance was a shilling a ton. The price of iron was advanced 10*s.* a ton, and the puddlers were given a shilling. That was how it was brought about. It comes to the same thing in the end, but those are the facts of the case.

10,792. In fact the men became discontented with the sliding scale and contended for an advance, which they obtained?—That was not the absolute case. They went for an advance of a shilling a ton without reference to anything, and they got it eventually, and the ironmasters in South Staffordshire first of all advanced their prices 10*s.* a ton, and then gave their puddlers a shilling.

10,793. And then they advanced prices another 10*s.* a ton, and gave them 1*s.* 6*d.* ?—No, a shilling is the amount. We are paying now 8*s.* 6*d.* a ton for puddling, and the price of bars is 7*l.* 10*s.* 0*d.*, therefore it is not 1*s.* 6*d.*

10,794. At any rate, if you get more profits as the price of iron goes up, you can afford to pay higher wages ?—Yes.

10,795. May not that account for the reason why the men struggled to get the advance ?—As a matter of fact, the price of iron had not risen when they struck. We should be only too happy to get a price of iron to enable us to give higher wages.

10,796. (*Earl of Lichfield.*) Have you seen Mr. Jones's statement upon that matter ?—I have not.

10,797. (*Mr. Harrison.*) As compared with this time 10 years back, how do wages stand now, above or below?—The lowest rate of wages that we have paid in the last 10 years has been 7*s.* 6*d.* a ton; we now pay 8*s.* 6*d.*

10,798. That is to say, they are now within 1*s.* of the lowest rate that has been paid for the last 10 years ?—Yes.

10,799. They have for some time been falling, since 1865 ?—Yes, since 1865 there has been a reduction twice; 10*s.* 6*d.* was the highest price, and they have been reduced to 8*s.* 6*d.*

10,800. (*Earl of Lichfield.*) Will you take Mr. Jones's statement in your hand, and see what he says upon the subject ?—Mr. Jones says, "The result was "that the ironmasters" (he is speaking of this strike) "advanced the price of iron and gave the men the "wages which had been demanded three months "before."

10,801. According to that it would appear that the rate of wages was not raised till the price of iron advanced ?—The rate of wages was not raised till the price of iron advanced.

10,802. And when it was raised was an extra 6*d.* added to the rate of the sliding scale?—Yes.

10,803. That is the way it came about?—It is.

10,804. Have you always been ready to listen to any complaints made by the men, and ready to receive them when they have asked to see you?—Certainly.

10,805. (*Mr. Mathews.*) On any grievance occurring with your men you generally leave the settlement of it to the managers in the case of hiring men, I presume ?—Yes.

10,806. In the case of the manager and the men disagreeing an appeal is made to you, and you are always ready to receive that appeal ?—Yes.

10,807. You are open to settle a case when the manager and the men cannot agree ?—Yes.

10,808. (*Earl of Lichfield.*) I need not ask you whether you are in favour of arbitration in cases where it comes to a dispute between the masters and the men, because you proposed it in North Staffordshire?—Yes.

10,809. (*Mr. Hughes.*) Should you be in favour of enforcing the awards of the arbitrators legally, because the difficulty hitherto with respect to arbitration has been that the arbitrator has no power to enforce his award, but that the party who is dissatisfied may say, "Oh, well, we have been to arbitration, but we are not legally bound?"—That is the great difficulty, no doubt.

10,810. Do you feel that you could go so far as to enable either party to make the award, as we say, a rule of court, which would enable the enforcement of it on either side?—Which would be practically legislative interference in the control of labour. Certainly I am entirely opposed to that.

10,811. Supposing that arbitration were legalized, and the award made a rule of court, it would be enforceable against the one side, the master; but how would you propose to enforce it against the man?—I do not see how it is to be done.

10,812. You are prepared for no legislation in that respect?—I am not prepared for any legislation. I think that any legislation interfering with labour is decidedly injurious.

10,813. You would leave it voluntary and have the arbitration go for what it was worth; you would let the arbitrator, who of course would be a person greatly respected in the district, give his opinion, and you would trust to both sides to carry it out loyally, but you would not enforce it by legal sanction?—No.

10,814. (*Sir E. W. Head.*) Would it be possible to enforce an arbitration? Supposing, for instance, that the award was that the rate of wages should be so and so, could you compel the next day any one man to work at the rate of wages which had been fixed?—No.

10,815. (*Mr. Mathews.*) On the other hand, could you compel the master to employ a man if the arbitration went against him, whether he would or not?—No.

10,816. (*Earl of Lichfield.*) But do not you think that the decision of recognized arbitrators in whom the public had confidence would have such an effect upon one side and the other that it would in all probability put an end to the dispute?—I think that what may be termed a friendly interference sometimes would be advantageous, but beyond that I think that the question would be beset with great difficulties.

10,817. Then you would object to recognize a court of arbitrators?—I would most decidedly object to any legislative interference whatever with the trade of the country.

10,818. (*Mr. Mathews.*) When you speak of friendly interference you mean that you would approve of calling in as arbitrator someone who, as in the case of Lord Lichfield, was a man of high social position, and of known reputation for impartiality, and further than that you would not go?—No.

10,819. (*Mr. Booth.*) And what the arbitrator fixed should be considered to be for the time being a fair rate?—Yes.

10,820. (*Earl of Lichfield.*) You have seen Lord St. Leonard's bill?—Yes.

10,821. What is your opinion of it?—I do not think that it is either one thing or the other.

10,822. You think that it would be inoperative practically?—Yes.

10,823. (*Mr. Harrison.*) You gave us just now the per-centage of wages to the total cost of production as being about 80 per cent. where all the operations are carried on in the same works. Now, could you take the case of ironworks where they do not raise the ore or make pig-iron, and where they do not raise the coal themselves, but where they have to buy both. Would that be your own case; for instance, do you raise coal?—Practically, we do; the concern is all under one management.

10,824. Take the case of works (of which I suppose there are many) where they neither raise the coal nor

Mr. W. S. Roden.

29 Nov. 1867.

make the pig-iron, what proportion would the weekly wages of that department bear to the cost?—In round figures about a third; that is to say, a third would belong to the mills and forges, and two-thirds to the other parts. I cannot tell you nearer than that.

10,225. (*Mr. Mathews.*) Every work differs so much in its particular circumstances that it is impossible to give any accurate answer to that question?—I think so. I was asked just now about arbitration. I ought to add that in the case of an award which was considered to go against the workmen, I do not think that there would be anything like so strong a means of enforcing that award, as in the case of the master. If an award went against a master he has his position in the district, and many other circumstances to influence him; his credit is at stake, and everything else, and I think that the master would be unduly bound, while the men would be free. That is the broad view of the question.

10,826. (*Mr. Hughes.*) It is said that if the unions were legalized the process might be made to take effect against them; should you be prepared to support any legislation of that kind?—Certainly not. I would have no legislative interference in the slightest degree between masters and workmen.

10,827. (*Mr. Harrison.*) Would it be impossible to enforce a contract between an individual and a crowd?—Yes; it would be only to the extent of their funds that you could enforce the contract, namely, by imposing a penalty. I may mention that during the last 30 years there have been many strikes in North Staffordshire, but they have never in any single instance been successful.

The witness withdrew.

Mr. F. Smith.

Mr. Frederick Smith further examined.

10,828. (*Earl of Lichfield.*) I will ask you one or two questions upon some evidence that was given by Mr. Hobson the other day. On looking over that evidence this morning I see that there are one or two answers bearing upon the state of things at Lord Dudley's works, and it would be just as well if your attention were called to them in the event of your having any remarks to make upon them. You will find that at question 8893 Mr. Hobson was asked, "Is it not the fact that the list price of iron is confined to all but a few works in Staffordshire who make iron which cannot be made in any other district, and which command in consequence of that extra quality a better price?" and his answer is, "I do not think that the Earl of Dudley goes by the list price. I am under the impression that he receives 1*l.* a ton or more for his iron than the list-price." One would infer from that, that although at your works you were paying the wages according to the list price of iron you were receiving 1*l.* more than the other masters in that district?—We always keep a little above the list price whenever we can—about half-a-crown. There are some markets where even that cannot always be obtained, but we do not go above that half-crown.

10,829. But is there any additional cost in connexion with the manufacture of the iron?—Decidedly; we pay a great deal more for the pig iron than our neighbours pay. Our iron produces a better yield to the workmen than perhaps almost any other iron does; it is the old style iron that used to be used in Staffordshire a generation ago, and the waste in the conversion is less than with the inferior quality of the present day, in which there is so much spurious matter that has to be got out by the puddler.

10,830. (*Sir E. W. Head.*) The puddler gets a larger sum in working out this iron, because he gets more iron out of a given quantity of pig iron?—Yes, without more work.

10,831. (*Earl of Lichfield.*) In point of fact, although your prices are higher your wages are really higher in proportion, in consequence of the nature of the iron enabling a man to get more out of it?—Yes, the labour to do the work is less, and therefore he earns his money in a shorter time; but it is quite a mistake to say that we receive 1*l.* a ton more. I wish it was so.

10,832. (*Mr. Hughes.*) How is it the other producers in the neighbourhood do not use the same pig iron as you if it is so much better?—We make our own pig.

10,833. Then when you say that you pay more for your pig iron you mean that you pay the men for for working it?—Yes, we pay more wages for it, the materials being more carefully worked.

10,834. (*Earl of Lichfield.*) In the answer to question 8911 your name is mentioned. I merely call your attention to it in order that you may make any remark, if you wish to do so?—It is stated there that I "would not meet the body" of men; that is simply because you cannot. I have tried to deal with large bodies of men, and I have not found it lead to any practical result. I have found that you could discuss the matter very much better where you were dealing with a few than where you were dealing with a great number. Mr. Hobson also says there, "At other works the employers would not meet the men at all, and the manager invariably had to settle the difference between them." I am not aware of that fact, and it surprises me to see it there.

10,835. At any rate, as far as you are concerned, you are not aware that you have ever shown any indisposition to discuss the matter with them though you have objected to meet a large body?—In regard to iron, I do not remember at this moment ever having refused to meet any men, whether a great number or a small number.

10,836. Then in answer to question 8927, Mr. Hobson says, "This quality of iron, hoop iron, was worked at most of the works in Staffordshire, and the men waited upon their employers, Messrs. Brown and Freer, and obtained the 6*d.* per ton advance in consequence of the Earl of Dudley paying 6*d.* per ton more than any other master in the trade, and as soon as Messrs. Brown and Freer conceded it the question was laid before the iron-masters' meeting (it was then near to their quarterly meeting), and the resolution was issued from that meeting that they recommended Messrs. Brown and Freer and the Earl of Dudley to discontinue paying that to the men, as they considered it an innovation in the trade." What does that mean?—When the works were put up first, the machinery was not calculated to make that class of iron. Since that time the machinery has been altered and the price has been reduced.

10,837–8. Then I think you must have your attention called to the answer to question 8965. I merely call your attention to it because your name is mentioned there. We should infer from that answer, that although the men were in the right as proved by your having given the 15*l.* as compensation to them, they did not obtain that redress without having recourse to a strike?—I must ask Mr. Hobson what year that was in.

(*Mr. Hobson.*) In May 1864.

(*Witness.*) That was before I had anything to do in the management of the Round Oak works, and my father was in those days ill and unable to give his personal attention to it, and just at that time the management of the works was really in abeyance. My father being unwell the works were in a sort of interregnum, and the manager on the ground could hardly know how to act. It was a special occasion that could hardly be put in in evidence one way or the other. Since I have had anything to do with it we have gone on in the most amicable and satisfactory way. If there has been a grievance it has been heard out and redressed, and the matter in dispute has been disposed of most satisfactorily.

10,839. In answer to a question which I asked you yesterday as to whether the wages of the millmen were always reduced in proportion to the wages of the puddlers, I think you said that they were, and I understand that in one case (I wish to know how far this is correct) in January, 1867 when, the puddlers were reduced 1*s.* a ton the millmen were reduced from 30 to 40 per cent.?—I am surprised to hear that. That may, perhaps, be true in some little matter of detail. We have so materially altered our machinery lately that just what I said as to the hoop mill would apply to some of the rolling mills, extravagant prices were paid at some of the mills and work was done that the mills were not calculated to do, and it was done at an extra expenditure of labour. Then when the mills were afterwards altered and suited to the work required; the millmen were in those particular instances reduced to what the average price of the country was, by the 30 or 40 per cent. which your lordship refers to, having been that much in excess up to that time of the country's rates. We spent a great deal of money in improving the machinery and assimilating it to machinery in other works.

10,840. I think we understood from you yesterday that there had been no strike either for a rise of wages or for resisting a reduction between 1863 and the lock-out which took place in 1865. Will you give the Commission some information with regard to that lock-out. I believe that you were one of the masters who locked out their men at that time?—I was, and very reluctant we were indeed to do so; but it was from our finding that in consequence of the union there was a sort of conspiracy against the iron trade of England, the union attacking us, if I may use the word in a sort of stratagem, trying to concentrate all their efforts on what they thought was the weak point of the iron trade of England, namely, North Staffordshire. They thought that if they could direct all their power to North Staffordshire and get them to give way, then they would work out all in detail and make the whole iron trade of England give way in detail, district by district. Finding that North Staffordshire was not strong enough to stand out by itself we had a meeting at York on March the 17th, and there it was decided that all the iron districts of England should unite to assist North Staffordshire in their defence against the action of the unions.

10,841. What grounds had you for supposing that there was such a stratagem, as you have described it, on the part of the men?—It was so generally understood at the time. I am not aware that the men to whom I spoke concealed it.

10,842. We have been told by Mr. Jones that one thing that mainly induced the masters to adopt that course at the time was a letter that was written by Mr. Kane on the 15th of March 1865. Do you remember that letter having been referred to in connexion with the consideration of the question of the lock-out?—No, I do not remember that.

10,843. That letter has been put in by Mr. Jones, and it is to this effect; it is an extract of a letter from Mr. Kane, dated the 28th of January 1865.—"A delegate meeting was held at Brierley Hill and a resolution was passed to the effect that the men of North Staffordshire resist the reduction. The council of Brierley Hill called their number of the North Staffordshire men out on strike and acting in concert with our friends at Brierley Hill, and seeing the necessity of such we immediately instructed the men of the Hanley district to come out also, to the number of 450." I suppose that that was one of the reasons for your considering it to be a combined movement on the part of the men throughout the whole of the country?—Yes, the unions were attacking us in detail.

10,844. As you are aware, the course adopted by the masters on that occasion was severely commented on in many of the public papers at the time, as being a cruel act towards the men. Would you explain to us in what manner you would justify the course that was taken by the masters on that occasion?—The men themselves forced us, the masters, into a most cruel position. They had ruin on one side, or a very harsh course of action to our men on the other, and that was the position the masters were placed in. If they had not locked out their men, the North Staffordshire district must have been ruined, and other districts of England that would have had to follow in the same course as North Staffordshire would have been ruined also; and to avoid a greater misfortune we had to resort to what we all regretted very much indeed, that course of action towards our men. But after a fortnight the masters in the North of England withdrew from that course, and we in South Staffordshire in due course withdrew also.

10,845. Did you consider that it would be impossible for the rate of wages to be raised and continue at 10 per cent. in North Staffordshire above the rate of wages prevailing in South Staffordshire?—It would have been utterly impossible commercially, they must all have become insolvent in a longer or a shorter time, according to the larger or smaller amount of the capital they were trading upon.

10,846. Was there any other means of which the masters could have availed themselves to protect themselves against this threatened advance of wages being forced upon them?—We tried to discover some other course at that time, and we could not succeed in doing so. Arbitration was out of the question, because if the award of an arbitrator is that a master, who cannot afford to do it, shall still be required to pay a certain rate of wages the master is put in this position, that he either must obey the award and be ruined, or defy the award and not be ruined.

10,847. Do you think that the course that was suggested at the time by some persons would have availed. I allude to the suggestion which I know was made at the time, that the masters, instead of having recourse to the lock-out in their own district, might have adopted the course of supporting during the strike the masters against whom the men had struck in North Staffordshire?—It would not have been practicable in South Staffordshire at all. Some of the masters could have contributed, but with so many firms (I think there were about 120 firms, some very large capitalists and some very small) they could not have agreed upon a rateable contribution to support the North Staffordshire masters. They could not have combined for the purpose practically.

10,848. (*Mr. Hughes.*) You said yesterday towards the end of your examination that unions had improved very much lately, will you state how?—After they have done so much to ruin the trade of the country, the country is in a state of depression, and the men and the masters are suffering alike. The masters have no orders, and the men have no work. The consequence is now that a man is much more tractable and ready to work on any terms than he was when trade was flourishing, and when, perhaps, two masters were running after one man. It is just the opposite now, masters are running after orders and the men are running after employment.

10,849. But as to the unions, can you state in what respect they have improved; have they become less violent?—After a quarrel there is often a renewal of good feeling, and the masters and the men having had a violent collision, perhaps better feelings are springing up between them; both perhaps are improved. I do not mean to say that the masters were always right, or the men always right, there was a good deal of good on each side, and a good deal was done on each side that was to be regretted, and now we are much better friends than we were.

10,850. Do you think that on the whole as unions are conducted they are of advantage?—At this particular moment with the great depression of trade I have nothing to complain of in them, but I think that if there were to be a revival of trade there would be immediately a revival of the abuses of unionism.

10,851. (*Mr. Mathews.*) You do not think that the vitality of unionism is extinct?—No, but dormant.

10,852. (*Mr. Hughes.*) Do not you think it desirable

Mr. F. Smith.
29 Nov. 1867.

that the men should have some representative system to meet their masters?—I think that if masters are bent on doing the right thing by their men, there is no good in combination of men, or in combination of masters. A master who has the interest of his men at heart needs no union to make him attend to their interests.

10,853. You belong to combination of masters, do you not?—There is no combination, we merely meet to declare the nominal price of iron. A price of iron which is agreed to by about 120 firms, and only adhered to by very few, perhaps not half a dozen.

10,854. Then the document which we see published once a quarter, purporting to emanate from the iron-masters, is in point of fact a farce?—If you see one day that the price in the published list is 7*l.* 10*s.* you may probably the day after buy bar iron from 30*s.* to 2*l.* a ton under that figure.

10,855. Then it has no meaning?—It has a meaning, because on the declared price the rates of puddlers' wages are fixed, and on the puddlers' wages all other wages are fixed.

10,856. Do you belong to the association with which Mr. Jones is connected?—No; that is the North of England.

10,857. Have you no association of masters in your district answering to trades unions?—We have quarterly meetings.

10,858. By whom was that resolution of the 17th of March 1865 to lock-out come to, because you have told us that the resolution that was come to at that meeting was the cause of the lock-out, that you went home and all locked out?—The lock-out began on Monday March the 6th, and the meeting at York was on March the 17th.

10,859. At which meeting the resolution was come to to lock-out?—We having tried the lock-out in South Staffordshire, found that it was necessary for the whole of England to combine to meet the course that the men were taking. Then, I think, we appealed to the North of England, if I remember right, on the 17th of March, that is to say, we having begun the lock-out in South Staffordshire on the 6th of March, appealed to the North of England trade on the 17th of March.

10,860. How was that resolution made binding?—It was not made binding, because it did not operate except for 14 days.

10,861. But there was a lock-out in consequence in large districts, in which there had been no lock-out before?—There was a lock-out in the North of England for 14 days, and then it broke down.

10,862. (*Mr. Harrison.*) How long did the lock-out in South Staffordshire last?—The meeting in Wolverhampton annulled the lock-out on April the 5th.

10,863. (*Mr. Hughes.*) During that time, be it longer or be it shorter, how was that general agreement so come to by the masters carried out; it was through some combination, was it not?—We combined for the moment; we combined during 14 days, and only during 14 days.

10,864. (*Mr. Harrison.*) In Staffordshire you combined longer, namely, from January to April, did you not?—In Staffordshire we combined longer. The general lock-out began in South Staffordshire on March the 6th, and terminated on April the 5th. You are, I think, mixing up, if not confusing, North Staffordshire with South Staffordshire. But the men in North Staffordshire were out of work during the time that you mentioned.

10,865. (*Mr. Hughes.*) Do you think that the masters were quite justified in combining?—We did it with the greatest possible regret.

10,866. Do you think that you were quite justified?—In cases of extremity you must resort to extreme measures, and the men put us in an extremity.

10,867. (*Mr. Harrison.*) An agreement was come to in December according to Mr. Roden's statement, which I think you repeat, that if the unions combined together to uphold the men in resisting the reduction of wages, a general lock-out of the ironworks throughout the kingdom should take place?—The date that you mention is partly right and partly not right.

10,868. It was agreed to in December, was it not, that if the men in any district did not accept the reduction, and in the other district the unions combined to support them a general lock-out should take place?—We are wrong in starting. It was agreed on December the 31st to reduce wages. That was all that was agreed in December.

10,869. Mr. Roden says, speaking of the meeting held in December 1864: "At that meeting it was "decided that the wages of puddlers should be re-"duced from 10*s.* 6*d.* to 9*s.* 6*d.* a ton, millmen's wages "10 per cent., and other workmen in proportion, and "that a notice of such reduction should be given "simultaneously by every master, and that in case "there was a strike in any one district, and it could "be shown that the trades unions combined together "to uphold such strike such combination should be "met by a general lock-out at the ironworks through-"out the kingdom." That is Mr. Roden's statement?—I hear with surprise then that they had proceeded so far as to frame a resolution of that kind, when we did not anticipate such a cause of action on the part of the men. It seems as though they had a foreknowledge of what was going to happen.

10,870. The statement goes on, "In pursuance of "the above Resolutions, notices for a reduction of wages "were given," and so on. It is the case, is it not, that for a certain period the works in Yorkshire and throughout South Staffordshire as well as North Staffordshire were closed?—Yes.

10,871. There being then no dispute whatever as to the rates of wages on which the men were to work in Yorkshire or in South Staffordshire?—Quite so.

10,872. The works were closed in Yorkshire and South Staffordshire, not upon any question of price as to the wages of the men, but absolutely until the men in North Staffordshire went to work?—Quite so.

10,873. What proportion of the men so locked-out were actually members of the union, who were supporting the North Staffordshire strike?—I presume that that question applies to South Staffordshire only?

10,874. Yes, I will say South Staffordshire.—And does it apply to puddlers or men who were not puddlers?

10,875. I am speaking of all the men who were locked out?—Well, there are two unions, the puddlers union and another union.

10,876. I will put it in this way. What proportion of the men (perhaps you can tell us positively in South Staffordshire, but I should like you if you can to include Yorkshire also) locked out in South Staffordshire and Yorkshire were members of any union directly contributing to the support of the North Staffordshire strike?—I approach the answer by reminding you that there are two unions, the millmen's union, and the puddlers' union. I believe that all the puddlers or very nearly all the puddlers were members of the puddlers' union, and that the puddlers very nearly unanimously, probably quite unanimously, supported the North Staffordshire strike.

10,877. Do you mean that at the time of the North Staffordshire strike all the puddlers throughout Staffordshire were unionists without exception?—No, I do not say without exception, because I knew men so disgusted with the union, that they left puddling altogether.

10,878. But that the great majority were unionists?—Nearly all those who were left were in the union. Some of our best puddlers have left puddling altogether in consequence of what they have termed the arbitrary tyranny of the union. I have lost them, and they are no longer puddlers; they have gone to less remunerative pursuits.

10,879. What other portion of the men locked out were not members of either of these unions?—It is very difficult to say.

10,880. It was a very large proportion, was it not; was it five or six to one, including labourers, and all

the people otherwise employed, not in the union?—I should not think so.

10,881. It was more than half, was it not, of the men who were not puddlers or millmen, and not in either union?—I have disposed of the puddlers.

10,882. As to the other men locked out, how many were not in an union?—I can only answer the question by guessing it?—but I should think that three-fourths of the men who rank themselves as iron-workers were in unions.

10,883. But there were a large number of people thrown out of employment not in the union at all?—Indirectly thrown out of employment. Of course the whole trade of the country was paralyzed.

10,884. What proportion were affected indirectly by the lock-out?—Almost everybody was more or less affected, indirectly.

10,885. But what proportion of persons were locked out of specific works—not being members of either of those unions—five or six to one would be putting it low, would it not?—It is too wide a question for any man to attempt to answer. Twelve practical men might give 12 such opposite answers that I could not really run the risk of guessing at it.

10,886. The men were locked out because a certain portion of their body contributed to the support of men in another district; that was the direct and avowed reason, was it not?—They were contributing to support the men in North Staffordshire who were on strike.

10,887. Then they were not locked out because they refused to work for their own employers upon the current terms, but because they were, out of their wages, contributing funds to persons in another district; that was the ground, was it not?—Just so; they were aiding and abetting in what we considered a conspiracy against the ironmasters of England generally.

10,888. Can you give me a case in which either unions, or combinations of working men, have ever done the same thing on their side?—I do not understand the question.

10,889. I will put it in this way then. Can you tell me a case where a body of working men, not having any dispute whatever with their own employer about wages, but having ascertained that he was contributing some funds to the support of another employer who had a difficulty with his men, have struck against him, not for an increase of their own wages, but in order to prevent him from doing what he pleased with his own money?—I have never known of an employer in South Staffordshire contributing towards the support of any other employer.

10,890. But generally in the country have you ever known a body of men strike against an employer, where there was no question of wages or employment, or terms of employment, as between themselves and that employer, but simply because they thought he was giving comfort and support to another employer?—I have never known a case of one employer giving comfort and support to another employer in any way.

10,891. Mr. Jones has told us that the very association of which he is the secretary pays out of its funds so much per furnace to every employer who has a strike, where the strike has been considered a satisfactory one by the association?—Mr. Jones belongs to an association in the North of England, and not in the South of England. I know nothing about the North of England.

10,892. Taking that as the case, have you ever known where men have said to members of that association: "We have no dispute with you whatever "about wages, we are on perfectly good terms, but "we refuse to work at your works for any wages or "upon any terms so long as you choose to find funds "for or to give any assistance to another master in "another district who has a dispute with his men?"—I am obliged to repeat what I said before. I have never known a case of a master in South Staffordshire paying one single farthing to any other master; and never having known the case of a master having paid to another master, I have, of course, never known the case of the men doing what you say. Mr. Jones belongs to the North of England; I have nothing to do with the North of England. I belong to South Staffordshire.

10,893. Do not you see a very great distinction between a number of men combining together, and striking for the purpose of obtaining wages from a particular employer against whom they strike, and the case of men striking not on any question of wages, but to prevent a man subscribing out of his own profits to such purposes as he thinks fit?—Really, I must admit myself puzzled. It is an hypothesis which I cannot see bears in any way upon any practical point which I have been connected with.

10,894. The lock-out as practised in Staffordshire is a totally different thing from anything ever done in a strike; because when men strike they want a certain price for their labour from a particular employer, against whom they strike. But in this case men were locked out and refused employment absolutely until certain other persons, over whom they had no control, went to work. I ask you whether you do not see a difference between those two cases?—I may mention that when I told our men what was going to happen (I talked it over with our leading men in as friendly a spirit as I could talk it over with anybody else), they admitted the inevitable justice of the course that the masters were taking, deprecating very much the conduct that certain men had adopted, and they admitted that they had by their own act forced the masters into this position, that the masters had no alternative but to adopt the course that we were adopting.

10,896. Supposing the case of the men in South Staffordshire believing, but having no exact proof of the fact, that the employers in South Staffordshire were supplying money or other assistance to a master in Yorkshire, who had refused his men an advance of a shilling; what should you say if the men throughout South Staffordshire had suddenly refused to work at any price whatever, until that master in Yorkshire had given the shilling advance. Would you think that reasonable?—You are putting the converse of the lock-out of the men?

10,897. Yes. In the first place, I ask you if I have not stated what is the exact converse of this South Staffordshire lock-out?—I have never known masters drive the men into the extremity that the men have driven the masters into. I have never known any case at all analogous to it.

10,898. I will go to another point. The state of the iron trade has been now for some time in a depressed condition, in consequence of very general causes affecting the trade of the country, has it not? Yes, from a combination of causes and a general derangement of trade.

10,898. And do not you think that the state of the money market generally, and the state of trade generally, and the state of the prosperity of the country, is sufficient to account for the great fall in the price of iron along with foreign competition, without assuming that it is the direct consequence of unionism?—It is a combination of causes; but of those causes unionism is the leading cause.

10,899. How do you account for this fact then, that the iron trade in other parts of England and on the continent, where there is no unionism whatever, is also in a very depressed state?—The trade of the whole world has been affected of late.

10,900. (*Mr. Merivale.*) Has not the iron trade of Wales been suffering very much?—Yes.

10,901. Quite as much as that of South Staffordshire?—The iron trade of the whole of Great Britain has suffered.

10,902. I mentioned South Wales because we have heard that there are no unions there at all?—That has suffered.

10,903. (*Earl of Lichfield.*) Are you aware whether any works in Wales are in full work now?—I heard what Mr. Clark said on that subject.

10,904. (*Mr. Harrison.*) Do not you think that

Mr. F. Smith.
29 Nov. 1867.

the falling of prices is due directly to the very active competition at home and abroad?—I believe that some time ago, about two or three years ago, when unionism was so formidable, it caused the prices of produce in England to reach a very much higher figure than they ought to have reached, and we could just for a short time command those prices. But the consequence of that short period of prosperity has been a subsequent reaction which has told most lamentably upon us, because during those few months of prosperity, the markets which we had up to that time controlled, and almost had a monopoly of, began to be supplied by foreign countries, and foreign countries have in some instances entirely taken from us for themselves those markets which, up to that time, we had had either the whole control of, or a very large portion of.

10,905. (*Mr. Hughes.*) Is that entirely owing to the competition of Belgium?—I cannot say entirely. In some instances people who used to pay us 700*l.* a month have not paid us 200*l.* a month, and when I ask the reason why, merchants say because we now get supplied from Belgium.

10,906. (*Mr. Merivale.*) In your answers are you speaking of South Staffordshire or England generally?—I am speaking of England generally.

10,907. You are speaking of the effect of unionism in causing high prices, which you say have produced an effect prejudicial to us?—I think I may say almost to England generally.

10,908. Do you mean to say that unionism in South Staffordshire has had the effect of driving up the price of iron in Wales?—Yes, throughout England.

10,909. Although probably the far greater part of England is not directly affected by unions, is that so?—The prices that rule in South Staffordshire and in the North of England would affect all other iron-making parts.

10,910. Then it comes to this, that the union in South Staffordshire is powerful enough to raise prices in your belief to a damaging extent, not only in South Staffordshire, but all over the United Kingdom?—It raises the price of iron in one district, and the moment the price of iron is raised there that runs throughout England.

10,911. (*Mr. Harrison.*) In the South Staffordshire association the price of iron is fixed first and the wages follow it?—Yes.

10,912. Then the price of iron is not declared by the wages, but the wages declared by the price of iron?—It has sometimes been both ways. Sometimes the men have forced up wages (I think I shall find, if I remember very accurately, that what I am saying I can substantiate), and then it has been necessary to advance the price of iron.

10,913. On what occasion have the wages been forced up without a corresponding increase in the price of iron?—That has been referred to to-day, I think.

10,914. In what year was that?—I have not a note of it here, but there was a period when wages were forced up.

10,915. Within the last 10 years?—Yes; I cannot go further back than 1863.

10,916. When have wages since 1863 been forced up without a previously declared rise in the price of iron?—Mr. Roden answered that question, and I have not the particulars here to enable me to answer it.

10,917. You do not remember any case?—I cannot remember accurately enough, but he mentioned it this morning.

10,918. But was it not the case in South Staffordshire that the men remonstrated against a rise in the price the last time that iron was raised, before it fell to its present low state; that is to say that the men in certain districts remonstrated against the policy of raising the price, although the effect of it was to raise their wages?—I never heard that.

10,919. You would be very much surprised then if you were told that when the last rise in the price of iron, which was declared before the strike of 1865, took place the men in certain districts remonstrated against the raising the price on the ground that it would injure the trade?—Yes.

10,920. There were three rapid rises, I think?—There were.

10,921. And the last of those, I think, the men remonstrated against, although the effect of it was immediately to raise their own wages?—The colliers took measures to strike for higher wages, and that of course sets the iron trade in motion; the moment that coal goes up you have to pay more for it, and you must increase the price of the iron which is made from the coal. So that the colliers' strike would of itself, to say nothing of the iron trade, have forced up the iron.

10,922. It was not the ironmakers' union that forced up the price?—The ironmasters' meeting knowing what was going on in regard to coal, and finding that they could get a higher price for their iron, naturally seized the opportunity of getting a higher price. The misfortune was that when they wanted to come down the men would not let them come down.

10,923. We have spoken of those three rises, do you think that looking back, and speaking quite dispassionately at this distance of time, it was a wise thing to raise the price with those three leaps?—It was, and it was not. If the men would have allowed it to come down about the end of March, when we wanted to bring it down, we should have had the benefit of three months' high rate of wages, and three months' high rate of prices. But though the men were ready enough to go up with the masters, when the masters wanted to come down the men said, "No, we will not be brought down;" and then we lost more in the subsequent difference between masters and men than we had gained during the three months of prosperity which we had secured by raising prices.

10,924. Still the last raising of the price of iron, previous to the great strike and the great fall, was sailing as near to the wind as it was possible to go?—Yes. The mistake was not in raising the price, but in not coming down at the right moment.

10,925. It was a price that could be maintained only for three months?—We did not know at the time that it could not be maintained longer, but we soon found out that the moment we got prices up to a certain figure, we diverted the trade out of its legitimate channel, and seeing that, we wanted to come back again, but the men would not let us.

10,926. Seeing that is so do not you think that the diversion of the iron trade of the country, and the depression of the trade, has been to a certain extent caused by that want of judgment in having raised the price up to so high a figure, which you say you very speedily saw was a mistake?—No, I do not think it was attributable to that at all, because we having seen the necessity for reducing, preferred to reduce the price but the men would not allow us to do so; that was where the mistake was.

10,927. Does it not appear to you that if the ironmasters' association are taking advantage on the one hand of every opportunity of raising prices to the highest limit, and if on the other hand the competition of the world is taking every opportunity it can to strike into our market; those two facts are quite sufficient to explain the very considerable depression in the state of trade now?—They contribute to it no doubt; not so much, however, as the effects of unionism.

10,928. This is an illustration of what I mean. Supposing we had now what we had in the old coaching days, half a dozen coach proprietors driving down to Brighton, competing against each other at ruinous rates, and underbidding one another in order to obtain the custom of the public; do not you think that it would be unreasonable on their part to throw the blame of ultimate failure not upon their own want of discretion, but upon the horses who would insist upon having so much corn to take the coach down. Do you see any analogy in my illustration?—I can hardly trust myself to go into those matters of theory.

I can go into the question of iron, but not into questions relating to coaches or horses. I should like to say a word with reference to Creusot which has been alluded to here. The Creusot people published a fact that they made from 15 to 8 per cent., and I think I am right in saying that it is the fact that they state to visitors there that their present profits are very low, as low as 8 per cent. At all events that I find in my notes on the Paris Exhibition.

Mr. F. Smith.
29 Nov. 1867.

The witness withdrew.

Mr. Robert Heath examined.

Mr. R. Heath.

10,929. (*Earl of Lichfield.*) Are you an ironmaster in North Staffordshire?—Yes.

10,930. How many men do you employ?—About 3,500 men and boys.

10,931. Have you seen the statement which has been put in by Mr. Roden?—I have.

10,932. Do you generally agree with it?—I do.

10,933. With reference to the strike in North Staffordshire, do you agree with it?—I believe it is perfectly correct.

10,934. If you agree generally with what is stated in his paper, I think that the only question I have to ask you is with regard to the men who took part in the strike having been unable to obtain employment, when they were willing to return to work. I will ask you, therefore, whether any considerable number of men were refused work when the strike was over by your firm on account of having taken an active part in the strike?—Many men of course lost their places in consequence of others filling them up, but I only positively refused to employ one. In one case certainly, I did positively refuse to take a man again.

10,935. What were your reasons for having refused to take on that man?—In the first place he made himself not only very objectionable to myself, but I believe very objectionable to his fellow-workmen. I believe it was as much on account of the reluctance of his fellow-workmen that he should come back as it was on account of my own that he was refused.

10,936. (*Sir. E. W. Head.*) You heard what was stated by the last witness, and by Mr. Roden, on the subject of the diversion of the iron trade to Belgium instead of England?—Yes.

10,937. Do you agree with those witnesses as to the fact of that diversion having taken place?—I agree that a good deal of Belgian iron has been introduced, not that I have ever myself been in any Belgian works; but I know that my customers frequently quote the prices of Belgian iron against myself, and that they keep a stock of it.

10,938. Do you agree with those witnesses as to the alleged causes of that diversion of the trade; do you think that that change was owing in any degree to the action of the unions?—I believe that it altogether arises from the cheapness of wages that they get their work done so much cheaper there, and no doubt the influence of unions has had a great effect in raising the prices of wages in England, not only in the iron trade but in other trades.

10,939. Do you agree with the last witness that the action of unions prevented lowering of the wages at the proper time to meet the state of the market?—I think that the last advance that was put on iron was most injudicious, and the advance in wages therefore most injudicious also, and the masters saw the evil and would have been very glad to retract, and of course it was retracting that brought us into the evil of a strike.

10,940. But do you think that the masters inability to lower the prices again when they thought the trade required it has been the cause of the diversion of the trade which formerly was with England to Belgium?—There is no doubt that the high price that iron was put up to here gave a great impetus to the Belgium trade; they got into the ground and could not be beaten back again.

10,941. The question is whether the putting up of the price, or the not being able to lower it again, was the real cause. There are two questions: you admit that the ironmasters raised the price at a time when it was injudicious to do so, as the result proved?—Yes.

10,942. But might not that result have been obviated if they had lowered the price again when they wished to do so?—They did lower it, but of course the lowering in price was entirely a sacrifice made by themselves for some period of time until they reduced the wages. The iron was reduced, I should think, six months before the wages were touched.

10,943. The point I wish to get at is, how far each of those two causes contributed to the diversion of the trade; whether it was owing to the want of judgment of the masters in raising the price, or to the interference of the unions in preventing their lowering the price?—I think that it was in the first place the want of judgment of the masters in advancing it; and I have no doubt myself that the iron would have come down more rapidly if the masters had seen their way clear to bring it down. But they did reduce the price of iron before they were disposed to reduce the price of wages.

10,944. They reduced it at their own cost, so to speak?—Yes.

10,945. (*Mr. Hughes.*) Do you say that your customers keep a stock of Belgian iron in England now?—Yes.

10,946. Do you think that the Belgian iron is as good as the English iron upon the average?—I do not think it is for every purpose.

10,947. Messrs. Creed and Williams state in their book that it is irregular and not to be depended upon; do you agree with that?—I cannot speak practically, but I know that my customers keep a stock of it, and that it answers their purpose to keep a stock of it, because they can get it cheaper from Belgium.

10,948. (*Mr. Mathews.*) Are the plates in Belgium quite equal to the plates in England?—I should think they are for shipbuilding and ordinary purposes, but not equal to the Low Moor iron and some extra qualities that we make.

10,949. (*Mr. Hughes.*) Are you aware of the statistics of the Belgian trade since 1865?—I have seen them merely by reading them.

10,950. Do you attend the ironmasters' quarterly meetings?—I do occasionally.

10,951. How far do those quarterly meetings bind the ironmasters; what is the meaning of those quarterly meetings?—The great object is to arrange the question of wages, and of course the question of prices is discussed; but I do not think that the prices arranged are at all binding upon the masters there.

10,952. I suppose they are to a certain extent morally binding?—There is no doubt that they have some influence in regulating prices.

10,953. You would consider them so far binding that I suppose a master would lose caste if he departed from them?—Oh, dear no; there are very few masters who really truly sell iron at the prices quoted at those meetings. The present quoted price, for instance, is 7*l.* 10*s.* 0*d.* at the works in South Staffordshire (such works as Foster's, for instance), my price is 6*l.* 12*s.* 6*d.* delivered in Liverpool, which all parties in competition with me have to sell at.

10,954. If as to prices the masters are not bound, as to wages they are?—Those are generally come to by special resolution.

10,955. Those special resolutions only bind the gentlemen there who belong to these meetings morally?—Yes.

10,956. You do not have any penalties imposed?—No.

10,957. But in supposing that there had been a resolution passed with reference to wages, I apprehend

Mr. R. Heath.

29 Nov. 1867.

that a man would lose caste who did not keep to it?—I should not think he was entitled to the confidence of his friends on any future occasion.

10,958. You said you employ 3,500 men and boys; do you employ any women?—No, I do not.

10,959. Do you think it desirable that women should be employed in the iron trade?—I certainly have an objection to it myself.

10,960. (*Mr. Harrison.*) Women are employed in Staffordshire, I think, in the iron trade?—In North Staffordshire. I do not know any case of women being employed either on coalpit banks or in ironworks.

10,961. I think that the return gives 200 out of 2,000 as the number of women employed?—One reason is that a great number of women are employed in the Staffordshire potteries. The potting trade is the trade of the locality, and a great number of women are employed in that trade, and it is more adapted to them. I should have no desire to have women employed in the iron trade.

10,962. (*Mr. Mathews.*) Have you ever considered what proportion in the cost of bar-iron at 6*l.* 10*s.* 0*d.* consists of labour, and what proportion of other trade charges that are not moveable. In an establishment like yours, for instance, what proportion of that is labour, and what royalty and fixed charges?—I should think fully 80 per cent. would be labour, including the process from the mine to the office, if I may so put it.

10,963. (*Mr. Harrison.*) Do the wages of the ironworkers never go up or down, whilst the wages of colliers may be stationary?—Sometimes. They do frequently in our neighbourhood for this reason—our colliers are not altogether employed in getting coals for iron, but they get coal for the pot-works which are large consumers of coal. Consequently our case is rather different from that of South Staffordshire, where iron is the staple; nearly the whole of the coal raised there is used in the consumption of iron.

10,964. Therefore the wages of the colliers are not absolutely governed by those of the ironworkers in North Staffordshire?—No, not in our locality.

10,965. You have told us that 80 per cent. of the cost of a ton of iron is labour. That includes the labour of the colliers, and the labour of those who get the ore and make the pig-iron; but what proportion of the cost is affected, or is to be attributed to the weekly wages of those classes of men who are affected by the reduction of wages which is fixed upon at the quarterly meetings? When the price of wages are fixed upon at the quarterly meetings, of what classes of men are the wages therein included?—Coalmasters sometimes meet on other occasions besides those meeetings in regard to the iron, but I do not think that the colliers' wages in our locality are at all governed by the price of iron.

10,966. When wages are regulated by a resolution of that kind passed at the quarterly meeting, it applies to the wages of the puddlers and the wages of the millmen, and the men of the blast furnaces?—Yes.

10,967. Those are the people included?—Yes.

10,968. What proportion of the cost do the wages of those men exclusively bear to the whole?—Well, in my case, I have to do exclusively with iron. I do not sell coal for these other purposes. Consequently in my case it embraces the 80 per cent. I do not sell coals to the potters, or only a small quantity.

10,969. Does the 80 per cent. not include the cost of coal?—Yes, it does.

10,970. When you reduce the wages of your men 10 per cent., upon what proportion of the cost of a ton of iron is that reduction felt?—If it is reduced throughout the whole, of course it is felt throughout the whole.

10,971. But it is not reduced throughout the whole of the rest, because it is not reduced throughout the coal?—In my individual case I say it would be so. I am exclusively connected with iron.

10,972. The coal is counted in, and so is the cost of the pig-iron, as part of the 80 per cent.?—Yes.

10,973. By making a reduction of wages at your works, you do not reduce the wages of colliers, because you do not employ them as I understand you?—I do employ them, but not to get coal for selling purposes in the way that I was speaking of other people in the locality doing. There are colliers in the district who get coals for the potters, and for other purposes which are not directly influenced by the price of iron.

10,974. When you make a general reduction of wages at your particular works, upon what proportion of the cost of a ton is that reduction felt?—In the full proportion as 80 per cent. is to the 100.

10,975. The 80 per cent. includes the wages of those whom you do not reduce?—But I say in my case I do reduce them, because I have to do exclusively with iron. When I say that the colliers are not always reduced, it is because some colliers work for other purposes than the iron trade.

10,976. (*Mr. Mathews.*) When there is a general notice given for reduction in works similar to yours, the reduction, generally speaking, applies to all descriptions of workmen?—Yes, but it does not always go through the district; it does not apply to every collier in the district.

10,977. It applies to those works similarly situated to your own?—Yes, which produce and use their own material.

10,978. (*Mr. Harrison.*) Mr. Roden told us that a third would represent the wages of those directly affected?—Yes, that was as to the wages on the manufacture of a ton of iron from pig to wrought, and that third would not cover the get of coals.

10,979. (*Mr. Mathews.*) Inasmuch as where men make their own pig-iron the cost of wages applies to every description of labour?—Yes.

10,980. (*Mr. Harrison.*) You would agree with Mr. Roden that supposing he bought his pig and bought his coals, then the manufacture would account for about a third of the cost?—Yes.

10,981. Then upon those manufacturers who buy their pig and buy their coal this necessity does not immediately fall, it may in an indirect manner, but it does not arise immediately?—Of course they do not get the same reduction on the aggregate, because they do not employ the men in the production of the raw material; they are merely employing them in the manipulation of the pig-iron, in the manufacturing of the thing, so to say, and they do not employ them in the production of the raw material.

10,982. Then, having to pay but one-third in wages to their own men, they would still have two-thirds of the cost upon which the necessary reductions could be met?—Of course they would expect to buy their pigs cheaper and to buy their coals cheaper.

10,983. That might be, but as the market for pig-iron and coals depends upon so many other causes that would have only an indirect operation?—Yes.

10,984. (*Mr. Hughes.*) On the average, what proportion are the royalties payable on coal, ironstone, and lime, all of which I believe you have yourself?—Lime is the only thing I do not get; that we all buy.

10,985. Are you mining on your own freehold?—No.

10,986. Then you pay royalties?—Yes.

10,987. About what proportion do royalties bear to the price of produced iron?—I should think about five per cent.

10,988. (*Mr. Mathews.*) They vary so much in different districts that it is impossible to give any accurate answer to that question, is it not?—Yes.

10,989. (*Mr. Hughes.*) You have to pay royalties on coal, on lime, on ironstone, and there is some other material, is there not?—There may be where people make their own fire-bricks. I do not make my own fire-bricks.

10,990. Supposing it to be stated by Mr. Mathews that the royalty on a ton of ore varies from 6*d.* to 1*s.*, and that as it would take 10 tons of ore to make one ton of iron it would therefore vary from 5*s.* to 10*s.* on the ton of iron. Would that accord with your views?

—I should think that five per cent. would be about the thing.

10,991. The royalties do not, as a rule, include anything at all except the stone. You did not get the use of any machinery for instance?—No; we pay, too, for the damage done to the land; we have merely powers to enter upon and work.

Mr. R Heath.
29 Nov. 1867.

10,992. Then the payment for surface damage must be added to the royalties in any estimation of the cost?—Of course.

The witness withdrew.

Adjourned.

1, Park Prospect, Westminster, Tuesday, 3rd March 1868.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.	JOHN ARTHUR ROEBUCK, Esq., M.P.
The Right Hon. the EARL of LICHFIELD.	THOMAS HUGHES, Esq., M.P.
Sir DANIEL GOOCH, Bart., M.P.	FREDERIC HARRISON, Esq.
HERMAN MERIVALE, Esq., C.B.	WILLIAM MATHEWS, Esq.
JAMES BOOTH, Esq., C.B.	

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. FRANCIS MILLS, sen., examined.

Mr. F. Mills.
3 March 1868.

10,993. (*Chairman.*) In what business have you worked?—As an iron moulder.

10,994. For whom?—For several masters in this town, and in the country as well. I have worked in this town as foreman for Mr. Thomson, of Pimlico, for four years.

10,995. For how many years have you worked for different masters in the neighbourhood of London?—18 years. I came up to London in 1850.

10,996. In what part of the country did you work before?—I have worked in Cornwall. I served my time in Bristol, and I have worked as piece master in Wales.

10,997. You have been a moulder, as I understand you?—All my life from a boy.

10,998. Have you in the course of your lifetime had much experience of the action of the unions?—I have a great deal. I have belonged to one for years myself in my younger days.

10,999. Where was that?—In Bristol.

11,000. What was the name of the union?—The Iron Moulders' Society.

11,001. And how many years did you continue a member of that society?—I believe about three or four years.

11,002. Why did you leave it?—I was scratched for nonpayment unknowingly. There was a long run. It used to be four months for town members and six months for country members. I was in my long run when the Bristol ironworks stopped, and I did not know it. I ought to have been summoned by the secretary, but I was not. Manchester was the seat of government then, and when I sent to know what I had to pay I was informed that I was scratched because I had not paid up. Therefore, I had to enter afresh by paying 5*l.*, although, being the only son of a moulder, I was entitled to have been in the club by payment of 30*s.* Since that I have been out, but they have wanted me to come in many times. For instance, on the occasion of the strike at Seawards and Maudsley's; but I thought that, as I had been out so long, and had done so long without trades societies, I should try to continue to do without them, and I have continued up to the present period.

11,003. (*Mr. Mathews.*) Whose works at Bristol were you employed at?—Acraman and Morgan's. I served my time at Acraman's.

11,004. So that in consequence of a nonpayment of your subscription you were excluded from the union?—I was.

11,005. And you objected to go back again because you thought that the sum required for your readmission was extravagant?—I did.

11,006. Were you at work at Acraman's then?—No.

11,007. What did you do when you left Acraman's?—I went to Wales. There was no society there at that time. That was in 1839 or 1840.

11,008. Why did you leave Acraman's?—Because the works stopped.

11,009. And you went then to Wales?—No, not at once. I went to the Great Western yard at Bristol, and I was engaged in the building of the "Great Britain."

11,010. As a founder?—Yes.

11,011. What founding had they there?—They kept their own foundry.

11,012. Was there any workmen's union at the Great Western yard at Bristol?—Well, the club men were working there. They were brought down from London to work there.

11,013. They belonged to the London union, you mean?—Yes.

11,014. Did the workmen who belonged to the London union offer any interference with you in consequence of your not belonging to the union?—No, for I was in the union at that time. I was in my long run then.

11,015. Let me take you to the period when you left the union; when was that?—I think it must have been in the year 1839 or 1840.

11,016. Was that whilst you were at work in the Great Western yard at Bristol?—No; I was then in my long run. After I left the Great Western yard I went to Wales, and then I found that I was scratched.

11,017. That is to say, you were excluded from the union when you went to Wales?—Yes.

11,018. Whose works were you working in when you were excluded from the union?—Russell and Brown's.

11,019. Where is that?—At the Blaina.

11,020. Was there any union of iron workers at Russell and Brown's?—Not at that time, but before I left one was formed.

11,021. When that union was formed what effect had it upon your occupation?—It had no effect with me because I had then agreed with the master for three years.

11,022. That is to say, you were under a contract for that time?—Yes, I was under a contract with them.

11,023. They did not interfere with you, as I understand you?—Not with me, but they did with others that were there.

11,024. When did they begin to interfere with you, was it after you left Russell and Brown's?—They

Mr. F. Mills.

3 March 1868.

did not interfere with me much till I came back to London.

11,025. You came to London after leaving Russell and Brown's? — I had been travelling about the country some time before I came to London.

11,026. You had no difficulty in getting employment in consequence of not belonging to the union till you came to London?—Not that I recollect.

11,027. What was the effect then? — The men wanted me at the time of Maudslay's and Seaward's strike to pay 5*l.* to enter the society again, and to share the same as the rest, but I did not see my way clear to doing so.

11,028. That is to say, you refused to pay the 5*l.* and preferred to remain out of the union?—Yes.

11,029. What took place then?—No opposition to me has taken place since then. I was foreman for Messrs. Wales and Robinson in 1862. I had been foreman for Mr. Thompson, at Pimlico, four years before that, and was recommended after leaving him to come to Wales and Robinson's, about the early part of 1862. I was laid up with the rheumatism and lost my situation. We had done a great deal of work for Messrs. Pontifex and for Messrs. Clayton. When Messrs. Clayton started their own foundry, at Lambeth Walk, I was just then on my month's notice, because I had been so long ill that they were bound to have another foreman in my stead. Mr. Clayton gave me a note to take to his manager at the works. I took it down, and when I took it down he told me to come on Monday morning, that was for me to go to work at 6*s.* a day, and when I went to work on Monday morning the men gathered round me, and one of them said, "I propose that Mills do not go to work," another said, "I second the motion." I was looking round for a place to put my hat, in the first instance, but I found that I was in the wood and that I hardly knew how to get out of it. One of them then said, "It is "proposed and seconded that Mills do not go to work; "those who agree to that resolution signify the same "by holding up their hands." They all held up their hands, and then the foreman said to me, "Now, as the "case is thus, we cannot think of breaking up the shop "for one man." I replied, "No, neither would I wish "you to do so; if I could not work comfortably I "would rather not begin." I told Mr. Clayton about it, and he said, "We shall see to that." I ought to have mentioned that before that, when I was foreman at Messrs. Thompson's, at Pimlico, I was fetched for Mr. Weeks, at Maidstone. I was foreman for him, and I put on my son, and because he was out of the society the men struck against him. Then I came up to London and got some non-society men. The master had two or three of the unionists fetched from the country and had them before the magistrate, and it was decided in my favour, but I did not press it. The men had left some patterns in the sand, but the master told me not to press the matter. All he wanted was just to make an example of the men that others should not do it again. I did not press it therefore. When I came back two days after that, the master said that he had agreed with his old foreman and old men, and therefore he thought it would be much better if I had not given up my situation in London, that I should go back to London again, and I went back to my old master.

11,030. Let me take you back to the period when those men passed a resolution to exclude you from work; the resolution I suppose was to the effect that they would not work themselves if you worked there?—Exactly so.

11,031. Were the men who passed that resolution all union men, or were there any non-union men amongst them?—They were all union men.

11,032. To your knowledge?—Yes.

11,033. And they passed a resolution which was in effect that if you worked there they would not work?—Yes.

11,034. And you thought it better rather than have any disturbance to decline going on with the work?—I did.

11,035. When you left work in consequence of your being excluded by this resolution of the men, did you take any other job afterwards?—Yes, I have been at work ever since, more or less.

11,036. Have you been interfered with since then by the men belonging to the unions?—No, but I have been kept out by the union men. If I had been in the club I should have had work, and I have been out of work now for 18 months.

11,037. How do you know that the unions have kept you out of work?—I have three sons, all married men who have got families, and they have had work.

11,038. Do you know from them that it is because you do not belong to the union that you cannot get work?—I know it from my eldest son. When I came up from being foreman at Bedford I had seen him at the shop, and at Mr. Oakley's, at Bow, and Mr. Oakley and I got talking, and I was telling him of the advantage of machine moulding, and he seemed favorable to me, and I invited him to take a run down and see the sort of work, and how men could be got from the plough-tail and turn out better work than the moulders did of that description.

11,039. What description of work was that?—Agricultural work, such as plough wheels, and so on. There are 500 hands, men and boys, kept on at Bedford. My son told me when I went to his shop to see him that if I was to apply to the master for a situation the rest of them would be obliged to leave, for they were all society men, which I knew, and likewise the master was himself, because he had been a moulder himself before he became a master. Therefore if he had put me on they would all have had to strike against me. I have been over to see my son once or twice, and he has said to me, "Father, I am sorry to see you out; we have been slack, but we are getting busy again." I said, "I am glad of that." He said, "There were four put on yesterday," (this was six weeks or two months ago), "and one of them I am sorry to say was a man as old as yourself, his name is Joshua Williams." I said, "Joshua Williams?" "Yes," he said "he was sent for because he was a union man." "But," he said, "when I knew you had been out so long I wished "you could have been put on; but you were not a "union man, and if you had come you must have "kept another out who was, and they would not have "worked with you." If I went there, and there was an order from the society against non-society men, I should be obliged to leave or have my sons walk out against me from the shop.

11,040. You declined to apply because you did not like throwing hardship upon your sons?—No; I have applied to every shop, society and non-society shops, but still I have been often refused, I know, because I have not been a society man. That is the first question put by the foreman.

11,041. (*Mr. Harrison.*) Have you been refused at non-society shops?—Yes, through slackness. There are not many non-society shops.

11,042. But when you have gone to non-society shops have you been refused?—Owing to want of work.

11,043. You have been refused in fact at non-society shops?—Yes.

11,044. (*Mr. Mathews.*) Not on account of your being a non-society man, but as I understand you on account of deficiency of work?—Yes.

11,045. In all cases where there have been society men you have been refused employment on the score of your being a non-union man?—Yes. There was another place, Perry's in Golden Lane, where I worked a week, and because I was not in the society then I was discharged on Saturday night.

11,046. When you work do you work subject to a fortnight's notice?—Foremen in general work subject to notice, but as journeymen they are not supposed to work in that way; if a master thinks proper to dismiss a man or a man to demand his money, if his mould is finished he does so.

11,047. You were not interfered with by the union, as I understand you, in any contract you had made as to employment?—No.

11,048. You were simply refused employment because it was known that you were a non-unionist in those shops where society men were the majority?—Yes.

11,049. (*Mr. Hughes.*) You say that in 1862 you were foreman at Wailes and Robinson's?—Yes.

11,050. And that was the year when these refusals to work with you first took place?—No, the first refusal to work with me was at Weeks's at Maidstone; that was in 1860.

11,051. When you went to Weeks's at Maidstone did you say that you applied there for a foreman's place?—No, the master fetched me.

11,052. As a foreman?—Yes.

11,053. You have never had any of these disputes as a journeyman, but as a foreman?—Yes, as a journeyman I have had them at Perry's in Golden Lane, and at Clayton's at Lambeth Walk.

11,054. Your working at Perry's in Golden Lane is quite a recent thing?—No.

11,055. On the occasion of that application to Perry's you applied as a journeyman, not as a foreman?—Yes, I got work there, and was discharged on Saturday night.

11,056. Your three sons belong to the union, you say?—Yes.

11,057. Have they been in work during the last 18 months?—Yes, and two of them for these last five years.

11,058. But during this slack period of 18 months while you have been out of work have all your sons been in work in London?—The youngest has been on short time, and now and then suspended, but the other two have been in full work.

11,059. As to this youngest son, did he get any assistance from his union?—No, not till he had been 12 months in the society, and then he got as donation money 4*s.* 6*d.* a week. When they have been two years in the society then there is 9*s.* a week donation money.

11,060. Then it seems a great advantage to a man, as far as work goes, in the metropolitan district, to be in the union?—It costs 2*s.* 3*d.* a week for contribution for those that are out; now at the present time 4*s.* a month is the regular average money in the way of paying the contribution, but now with the levies and one thing and another it runs hard upon them for 2*s.* 3*d.*, and perhaps 2*s.* 5*d.*

11,061. But you seem to think that almost all the shops in the metropolitan district are full of union men?—Yes, I know it because of my applications, and I only know very few the other way. I know that Mr. Maudslay or Mr. Grissell or Mr Seaward would not have a club man if they knew it.

11,062. (*Mr. Harrison.*) What is to prevent your getting work there?—The want of their putting on new hands.

11,063. But there has been nothing to prevent you at any time during the last 18 months taking work at any of these three firms you have mentioned, except that they did not give it?—Not if there was trade enough to employ fresh hands as journeymen.

11,064. (*Mr. Hughes.*) It would seem to be a great advantage to belong to the union?—It is to the union men, because it keeps them in employment; but as to the non-union men they cannot go in with the others. It is son against father and father against son, just now, and especially with me.

11,065. Your sons have paid all these heavy subscriptions which you have spoken of, 2*s.* a week, I apprehend for this very advantage of having work whenever it is to be got, and helping one another to get work?—Yes, and keep up wages.

11,066. (*Mr. Roebuck.*) And to get that work by excluding others?—In general the foreman asks the question of any man who comes to him, "Are you a society man or not?" then if he has got society men, and is partial to society men, and if that man who comes is not a society man, he declines him, because directly a non-society man goes into the shop the club men will not assist him. He is like a man sent to Coventry. When I was foreman myself I used to try to put on as many non-society men as society men, so as to have the balance equal, if one side should turn round. I was always prepared. I was always for paying a fair day's wage for a fair day's work. If a non-society man is in a moulder's shop, and he calls out for a hand (he may want a single hand, or four or six) the society men will not lend him a hand. It is just like a Catholic and an Orangeman in opposition, one against the other with a feeling.

11,067. (*Mr. Hughes.*) When you were foreman you always tried to put on an equal number of non-society men with society men?—Yes, according as my work would run.

11,068. Perhaps that might be the reason why you cannot get work with society men, it may be that they know that that is your society?—No, there is nothing against me. The men who have been working with me would work with me again. There are many that would go down with me now to Glasgow if they were not in the society. There is nothing that has ever been against me. I have always given club wages if I had labour for its value. They will work under a non-society foreman, but not with a non-society man if they can help it.

11,069. You have had no personal quarrels with union men, have you?—No, far from it.

11,070. Do you think that they are the most skilful men in the trade?—Certainly not; there are as good men out of the society as there are in.

11,071. (*Mr. Mathews.*) You say that you have paid 2*s.* a week contribution to the fund?—Yes.

11,072. When are men entitled to the 9*s.* a week, must they have been members a certain time before they can receive it?—Two years; but it does not always happen that they have got 2*s.* a week to pay. The levies paid are according to the men out of work.

11,073. If they were to invest that 2*s.* a week in any other description of investment, would not that be almost equivalent to the payment of the 9*s.* a week?—It would, but then the thing is this, the society man will work with a non-society man, but they say that a non-society man shall not work with a society man because he does not contribute to keep up wages.

11,074. That is to say, there is no indisposition on the part of the society men to work in a shop where non-society men are the majority, but where society men are the majority they say that no non-society man shall work with them?—Yes.

11,075. (*Mr. Roebuck.*) Have you lately tried to become a member of any trades union?—I have not. I believe I did mention it to my son, but I was gone over the age. The age was 45, and I was 54.

11,076. Because you were over the age you did not think it worth while to apply?—It was not altogether that. As they had kept me out so long I thought that the best of my days had been spent as a non-union man, and I would try to end my days as one.

11,077. (*Earl of Lichfield.*) Have you applied to the Free Labour Registration Society?—I have; eight or nine months ago I registered myself, and I have received a letter from them telling me to go to Glasgow. On the Monday when I ought to have gone I had a letter to go to Barking, but it was to carry out a patent, and therefore I did not fancy the thing much. I have applied at Glasgow again, and in answer I had a letter from Mr. Robinson telling me to see him. I did see him this morning, and he has arranged it for me to go to Glasgow on Thursday afternoon.

11,078. Have you got work there?—I believe there is work for me when I get there. My passage is to be paid there, and my reception is guaranteed. If there is a fortnightly pay or monthly pay, that amount will be provided to pay for such things as board and lodging until the money is paid back.

11,079. Do you not expect to find the same difficulty that you have met with in London in obtaining work?—No, because in this case I am guaranteed work when I get there. My passage is paid from here down there because the employment is wanted.

11,080. At what shop is that?—I do not know.

Mr. F. Mills.

3 March 1868.

11,081. (*Mr. Roebuck.*) You are guaranteed by the Free Labour Society here, are you?—Yes.

11,082. (*Mr. Hughes.*) Who pays for your passage?—The parties that want the labour.

11,083. What payment do you make to this Free Labour Society?—The only thing is, that if you get the employment from the Free Labour Society you have to pay half a day's wages in return.

11,084. To the Free Labour Society?—Yes.

11,085. So that you do not make any periodical payments before they give you employment, as you do in the union?—No, there is to be or there is now 1*s.* for registering, and you get the free member's card. Then there is a benefit club belonging to it. That benefit club is according to the man's ratio of wages; according to what he thinks he will require out he pays so much in.

11,086. (*Chairman.*) You mean, I suppose, that if you want to get, for instance, 6*s.* a week when you are ill, you must pay 1*s.* a week, and so on in proportion?—I do not know exactly what their terms are, because I do not belong to it; but if I wanted 10*s.* a week out I must pay in I think it is 3*d.* or 4*d.*, and if I want to get 18*s.* I must pay more in proportion.

11,087. (*Earl of Lichfield.*) When did you first apply to this society?—Somewhere about eight months ago I registered my name.

11,088. And have they been trying to get work for you since then?—When this application was made for men in Glasgow it seems that they applied to the Free Labour Society. Then I had a letter from them that there was work for me there if I would take it, and as I have said I am going down on Thursday.

11,089. Do you know that there is a strike there going on now?—No, but I knew that there was a lock out. The reason of my going down is that I have been out of work so long, and I have parted with all, and I have borne a good character in the town, and therefore being brought down so low as I am, I must go where I could get a crust for my wife without applying to the parish.

11,090. (*Mr. Harrison.*) When did you leave the union?—I think somewhere about 1832. I do not think I was more than two or three years in it.

11,091. You were first excluded from work for being a non-unionist about the year 1860, I think? How do you account for it that during those 30 years you were not at all molested, and that you have been since? Is there any explanation of that fact?—The only explanation that I can give for it is, that at places where I have applied they before have been non-unionists. It does not run in the country so much as it does in London.

11,092. When you came to London you found a difference, in fact?—I did.

11,093. Taking London, what proportion of the moulders in London are members of the union, and what proportion are non-unionists, do you suppose?—Five out of seven are society men.

11,094. And what proportion of the shops in London are confined to unionists exclusively; that is to say, what proportion are shops where the foreman says, "If you are a non-unionist we cannot take you on?" How many of the shops are strictly society shops?—I should think nine out of ten.

11,095. It is only the tenth that is open to non-society men?—Yes.

11,096. How many do you suppose of the shops in London are perfectly open to non-society men?—I cannot tell, because I do not know the number of shops in the town. I could get that, but I do not know the number of the shops. If I could get the list of the shops (which I could have got if I had known that these questions would be put to me), I could point out what shops are non-society and what shops are society shops.

11,097. If you have been in search of work for 18 months you would have your attention very forcibly directed, I presume, to the question what were the shops at which only it was worth your while to apply.—No, because I should go to every shop which I passed. I should not ask whether it was a non-society shop or a society shop. If they had work for me they could give it to me, and if not they would say, We do not want you at present.

11,098. There are some of the principal shops (you have mentioned Maudslay's, for instance) at which non-society men are not excluded?—Yes.

11,099. Are there any shops at which unionists cannot get work if it is known that they are unionists?—There is Prince's, in the Borough, and there is Nevins's, in the Borough, Rennie's, and many more in the same district.

11,100. You have applied at those shops, have you?—Yes.

11,101. Therefore your want of employment during the last 18 months was due to the slackness of trade?—Partly so.

11,102. Entirely so, was it not?—There are many places where I should have got a job, no doubt, if trade had been busy.

11,103. (*Mr. Roebuck.*) But the difficulty of getting work has been very much increased by the fact of the union men being against you?—Exactly so, because if I were a member of the society I should be brought into some place by a unionist if trade was busy. I should have no need of going and asking for a job, because as soon as a man is in want of work, if he is a member of the society, some man speaks to the foreman and he sends for him.

11,104. (*Mr. Harrison.*) You mean that your non-employment since you have been out of the union is very largely due to the fact that you have not had the assistance of the union in finding you work?—Yes, but the work has been very slack with them. There have been two-thirds of them out of work, so that they could not provide for their own number.

11,105. Is yours piece work or day work?—It is day work in the union, but it is either day work or piece work or anything else with the non-unionists.

11,106. Do you as a non-unionist receive higher wages in the course of the week than a unionist workman of equal skill would receive?—No; a unionist workman of equal skill gets higher wages than I do, because he has got something to back him up. He must not go in under 6*s.* a day into any shop in London, whereas I go in for what I am worth.

11,107. The result is that you receive less wages?—Yes; since the moulders have put on 38*s.* instead of 36*s.*, which is somewhere about 18 months, if a man goes out of a shop and he has been having 34*s.* a week, another club man must not go in without having 6*s.* a day.

11,108. If you as a foreman were selecting men for a certain class of work, would you select the non-union men as being superior in skill to the union men?—No. I should not select them unless I knew them, and then according to their abilities so I should put them on the work, whether they were unionists or non-unionists.

11,109. But would you suppose that the non-unionists as a matter of course would be superior in skill to the union men?—No; but I know by experience that there are in the union a great many men that are obliged to have their 36*s.* that are not worth 26*s.* to the master, and if they were non-unionists they would not have any more than they were worth, because the foreman would not give them more than their value.

11,110. (*Mr. Roebuck.*) So that the unions compel the master to give the inferior man a superior price?—Yes; that man, if he is put on by the foreman, does not go in under a certain rate of wages.

11,111. (*Mr. Harrison.*) You have not experienced anything like violence from the union; since your exclusion you have not received personal injury or personal molestation?—No; I have had little threats.

11,112. (*Mr. Roebuck.*) Supposing that at that time when they all lifted up their hands against you, you had said, "I will go to work," what would have happened?—I should have been rather afraid that something would have happened then.

Mr. F. Mills.
3 March 1868.

11,113. You would have been afraid of personal violence?—Yes.

11,114. (*Mr. Harrison.*) You have had no personal experience, however, of that sort?—Not myself; but I know it of others. In 1839, if I remember right, there were clubmen who came to start at Blaina, and they started work, and there was a man that had a heavy girder to make for the cotton factory at Bristol, and the unionists were against them, and there was a broken gate covered with wet clay put down his mould. He opened the mould the next morning, as he had a little suspicion that something unfair was going on, and he found this. The master offered 5*l.* reward to find who had done it, and small bills were posted all over the place, but they could not find it out. They had several of the men before the magistrates at Abergavenny; they could not bring it home to them, but they brought home to them conspiracy, and two of them had a month at Usk.

11,115. (*Earl of Lichfield.*) You say you have been a moulder all your life?—I have.

11,116. How long have you ever worked for one master?—12 years for Acraman and Morgan.

11,117. Where were you employed when you were excluded from the society?—I think I was at work at Abergavenny then. I cannot tax my memory now with all the details. If I had known the questions that would be put to me I would have been provided with my answers correctly as to the exact date.

11,118. Do you remember where you were living at the time?—I cannot.

11,119. (*Mr. Hughes.*) You were on the long run then?—Yes, and in the big shop; that is, searching for employ.

11,120. (*Earl of Lichfield.*) At the time you were excluded were you in regular employment?—I was not in regular employment, because the Bristol ironworks had stopped.

11,121. I conclude from that that you were out of work at the time you were excluded?—Yes.

11,122. You did not lose your employment in consequence of having been excluded from the union?—No, because when the Bristol ironworks stopped I was recommended by Mr. Morgan to Mr. Guppy; he wrote him a letter asking him to put me on to the Great Western yard, and I was there helping to make the engines to the "Great Britain."

11,123. You have had no regular employment, have you, since you were excluded from the union?—Yes, but our business fluctuates so much; if work drops off the hands drop off.

11,124. How long have you been with any one master since you were excluded from the union in 1832?—I have been six or seven years with Carbine and Rich, in Farnham Place, on and off according to the work.

11,125. You say "on and off," do you mean that you have been regularly employed?—Regularly employed, but when the work dropped slack I got suspended till the work came in again.

The witness withdrew.

Adjourned to Tuesday next, at 11 o'clock.

1, Park Prospect, Westminster, Tuesday, 10th March 1868.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.	JAMES BOOTH Esq., C.B.
The Right Hon. the EARL of LICHFIELD.	JOHN ARTHUR ROEBUCK, Esq., Q.C., M.P.
LORD ELCHO, M.P.	FREDERIC HARRISON, Esq.
Sir DANIEL GOOCH, Bart., M.P.	WILLIAM MATHEWS, Esq.
HERMAN MERIVALE, Esq., C.B.	

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. JOHN JONES further examined.

Mr. J. Jones.
10 March 1868.

11,126. (*Chairman.*) I believe you wish to give some evidence with reference to what passed here before?—Not having the printed evidence of the men before me when last I gave evidence, there were some few points as to which I could not quite recollect what had been said, and therefore I wish, if you will allow me, to give a little additional evidence on some matters that came forward. There are also a number of documents which I used before and did not put in, which perhaps you will allow me to put in now (*handing in the same*).

11,127. What is the first point to which you wish to call attention?—On referring to Mr. Kane's evidence at question 8,220, he mentions the total number of ironworkers in the union as 6,500, and I gather from other statements that the total number of ironworkers in the unions was certainly not more, as far as I calculate it, than one-tenth of the whole number of workmen employed in the ironworks. Now these one-tenth of the men are able and have been able to throw out of employment all the men connected with the iron trade. I only wish to call particular attention to that because of the small number of men connected with the unions who are able to affect the whole of the iron trade interest. As far as I am able to estimate it I think that only about one-tenth of the men are in the unions.

11,128. (*Mr. Mathews.*) I think we have it in evidence that every puddler being out of employ throws out from four to five other men?—I should say more than that. I calculate that he would throw out at least 10 men altogether in connection with the iron works, mills, forges and so on, in the different departments; that is to say there would be about nine other men and boys to one puddler.

11,129. In the mills and forges alone?—Yes.

11,130. Then at question 8,250 it is stated that the manufacturers in their fortnightly and monthly meetings fix the price of iron. It has been stated (and I could give additional evidence of the fact if necessary) that it is not the custom of the manufacturers in the North of England to fix the price of iron. That statement is altogether a mistake.

11,131. I think it has been stated that although there is nominally a declaration of price on the part of the ironmasters at the association meetings, no one considers himself bound by that price?—Yes, that is so.

11,132. Each ironmaster is at liberty to depart from that price when he thinks it his interest to do so?—Yes, and it is only in the case of Staffordshire that there is any attempt to fix prices.

11,133. Your having been secretary to both that district and the North of England district, can speak personally to that point?—Yes, as far as the North of England is concerned the meeting is open to the

Mr. J. Jones.
10 March 1868.

public, and at the end of the meeting some of the brokers and others are consulted as to what the price has been for that particular day, and that price is published and given to the newspapers as the actual price at which transactions have taken place.

11,134. And there is no attempt on the part of the iron-masters individually or collectively to interfere with any other ironmaster or coerce him into adherence to their rules?—Not in the least. At question 8265 with respect to the notices of reduction of wages in the Middlesborough district in 1866 Mr. Kane says "The masters stated 10 per cent. on puddling, but on "mill work they put out no fixed scale until they put "out what was called the revised list, which amounted "in many instances to 60 per cent." I wish particularly, as far as the north of England trade is concerned to speak to that statement, and I should like just to put in a comparative statement of wages which I have prepared. I find that in the early part of 1863 the wages paid were, for puddling (which may be taken to guide all the rest) 7*s.* 6*d.*, 7*s.* 3*d.*, 7*s.*, and 8*s.*, according to the works. But in April 1864 the wages for puddling were 10*s.* and 10*s.* 6*d.* Those wages were paid from the middle of 1863 to January 1865, that is 18 months. Then from 1865 to the middle of 1866 the prices were 10 per cent. lower than that, 9*s.* 6*d.* was the ordinary price, and 10*s.* 6*d.* and 11*s.* in special cases. That went on for 18 months Then the revised wages of 1866 which it is said were in many instances 60 per cent. lower, were 9*s.* 6*d.* for the best iron, that is to say for the grey iron, and 8*s.* 6*d.* for all ordinary iron, which was only a shilling less than had prevailed before. I have in the statement which I have prepared, given just the heads of the wages in other departments to show that there were only one or two special instances,—exceptional cases,—in which these heavy reductions were made. And with respect to the wages generally this comparative statement shows that when it is asserted that the wages were very low, 7*s.* and 8*s.*, for instance, it was only for a very short time that that was the case. When the union was most active, when all the strikes and so on took place, the wages were the higher wages mentioned in my statement, that is, for puddling 9*s.* 6*d.* to 10*s.* 6*d.*

11,135. I think we have had that already. Will you confine yourself to points which have not been brought under our notice before?—In answer to questions 8275 and 8294 it is stated that the masters in the north of England entered into a special agreement with the men that they would not change the wages without conferring with them. Mr. Kane says, "The masters published a code of rules wherein they "stated that prior to any dispute taking place a "conference of masters and men should be held." And further on, in answer to questions 8298 he says, "I have stated that the rules of the masters in the "North of England made the arrangement that prior to "anything in the nature of a strike or lockout being "likely to take place in consequence of a reduction "in the selling price of iron, a conference of the men "with the employers should take place." I would refer to the first rule of the Manufacturer's Association, which has never been altered, as the only ground which there could be for that statement, and there is nothing at all in those rules to warrant it. I will read that part of it which relates to the subject: "That the object of the association be deemed to be "the interchange of information on all matters con-"nected with the iron trade, more especially in "regard to the rate of wages and current selling "prices." And then the third paragraph says, "The holding free and friendly communication with "the representatives of the ironworkers, with the "view to the avoidance of strikes, and at the same "time the prompt and united resistance of any "attempt on the part of the men to enforce unreason-"able demands, or to limit the free action of any "individual ironworker." That was the only feature in the rules that could be a basis for that statement. Then in one or two cases allusion is made to the statements which I made as to the earnings of the men. One witness, I think Mr. Garner, mentioned that statement.

11,136. I do not think it worth while to go into that again?—I only wish to put in a document. I took out the wages at that time from the actual pay books, and this document could be substantiated (*handing in the same*). With respect to the evidence given about Belgium, I should just like to call attention for one moment to the answer to question 8412. That answer is, "Taking the difference of "wage between this country and Belgium and also of "the difference in the cost of living, I should say "that they would be about equal as Mr. Bell showed "in the paper which he read at Dundee. The "wage of one country is lower than the wage of the "other taken by itself." Now Mr. Bell in his paper states it rather differently from that, and I should like to put in that part of his paper. He says, "Without "going into details, it may suffice to say that animal "food is only 3 per cent. cheaper in the chief seats of "continental manufacture than with us; house-rent "and clothing are about the same in value with both. "On the other hand, at the present moment wheat is "fully lower in England and our own workmen do "not pay half the price charged to persons of their "own class abroad, for firing employed for domestic "use. Notwithstanding this almost perfect equality "in the cost of the necessaries of life, labor on the "continent is in very many instances 30 per cent. "below the price it commands in this kingdom. This "estimate is based on calculations where there is no "room for any great difference in the nature of the "work performed, common brick-making being "assumed as one of the standards of comparison. "In the manufacture of iron itself this difference is "occasionally still more remarkable; colliers, miners, "mechanics, ironworkers, in short every one engaged "in the process appear to be receiving 20 to 30 per "cent. below the rates current in this country, and in "some cases double and more than double the wages "paid abroad are earned in our English ironworks."

11,137. You cannot speak yourself about the relative cost of living?—No, but this is the extract alluded to by Mr. Kane. I have taken the above extract from Mr. Bell's published paper, and therefore the statement is not correct in Mr. Kane's evidence. Then with respect to the answer to question 8414, whether the English ironmaster has coal cheaper. Mr. Kane states that he understands there is more economy in Belgium in the use of fuel. Some recent letters on that subject have been published, and here is also the opinion of a competent ironmaster upon that question published in a letter from Mr. Isaac Lothian Bell, in reply to Mr. Plimsoll's letters which appeared in the "Times." The statement, which is from Mr. De Wendel, the largest individual manufacturer in France, leaving out Creusot, is "I hear that a Mr. Plimsoll has "recently drawn public attention to the defective state "of the pig iron manufacture in your country compared "to that of France and Belgium. The two visits I paid "to your works enable me to state that, so far as "Cleveland is concerned, the assertions is without any "foundation whatever. The high temperature of the "blast you use and the dimensions of your furnaces, "hitherto unknown in France, have secured for your "neighbourhood a superiority which I shall at once set "about imitating in my works. Mr. Judey, engineer "in chief at the immense works at Creusot, while on a "visit here ten days ago, stated, 'We and others in "'France have still a margin for economy in the manu-"'facture of pig iron, by avoiding the present heavy "'charges for transport in bringing coal and ore to our "'works. We must try to improve our method of work-"'ing, and thus seek to consume more of the minerals "'found near at home. Cleveland on the other hand, by "'the excellent results obtained in furnaces of recent "'consumption, and by the great care taken to avoid "'unnecessary labour, appear to have reached almost "'the minimum cost of production.'" The opinions of these two gentlemen are quoted by Mr. Bell to show

that as far as the north of England district is concerned, the Belgians are not working more economically than the English.

11,138. Do you think that any person of common sense attaches the slightest weight to Mr. Plimsoll's letters?—The public sometimes are guided by such letters. As far as the north of England is concerned, I believe it can be proved by evidence that we are working quite as economically as they are working in any other districts. Then in answer to question 8454 there is this statement: "There is a person who was "an ironworker of the name of George Thomas, who is "now endeavouring to get a living by selling half a "pound of tea or any odd work he can get. He waited "upon Mr. Hopkins; Mr. Hopkins told him that he "would never find employment in the north of Eng-"land." I have ascertained something about that case, and I find that he has been employed by the very firm which Mr. Kane mentions, namely, by Messrs. Hopkins, Gilkes, & Co. since the strike. He was formerly in the employ of Messrs. Bolckow, Vaughan, & Co. I do not know why he did not return there. He was a very active member of the union, secretary I believe, when the strike took place, and probably was the last to consent to work, but he has been employed by Messrs. Hopkins, Gilkes, & Co. since that time. In answer to question 8544, and a number of questions following that it is stated, and it has been stated frequently by the men that if the masters would agree to arbitration the men would agree to be bound by the decision of the arbitrators. It was stated also in Mr. Kane's evidence that he was in favour of arbitration, and that the men as a primary condition should consent to be bound by the decision of the arbitrators. I would just like to call attention to the fact brought out in evidence there, that though the men agreed to sever all connection between the North of England and other districts, that connection was quickly renewed and that the headquarters are now removed into Staffordshire, and therefore the masters appear to have very good reason for saying that the men would not be bound by the decision of the arbitrators inasmuch as they have declined to be bound by the decision of their own executive, which was come to in order to terminate the North of England strike. Then at question 9229, in the evidence of Mr. Kane, he states: "There are certain "illegal practices carried out, and this fining process is "certainly one of the worst." He says, "I have known "men literally starving in consequence of the fining "process." And other witnesses mention that it is a custom on the part of the iron trade to make deductions from all defective work, that the bad plates and rails for instance are thrown on one side and that the men are not paid for those plates or rails even if they are sent out as merchantable iron. I have made inquiries into that and I find that certainly as far as the north of England is concerned that is incorrect. If the plates or other work are defective the men are not paid, but if any of that work is found to be merchantable for some other purpose then they are paid the proper price for it. One case is mentioned as occurring in the neighbourhood of Bilston. I enquired into that case and found also that it was not the case in connection with the galvanizing trade. I think it was Mr. Garner who mentioned it, as far as I have made inquiries I have not found any confirmation of any case of that kind.

11,138*a*. (*Mr Harrison.*) You are not aware that that was one of the great complaints in the strike at Low Moor in 1864?—That is mentioned by Mr. Kane, I think. That was very clearly dealt with at the time, it being shown that it was one of the conditions on which they engage in work there, and that they understand all about it. But I do not know the exact circumstances of the Low Moor Works, and how they carry on their works, but certainly in the north of England I have gone into the question as far as regards plates and merchant iron, and I cannot find any instance where men are not paid for anything sent away in a merchantable form, though it may not have been adapted for what it was originally intended for.

11,139. (*Mr. Merivale.*) The answer to question 9153 is, "It is a total forfeit for the quantity which "do not cut the length and breadth." You deny that answer?—Yes, for it would be cut for something else. The tonnage of course would be less, but whatever it was sold for the man would be paid on the tonnage whatever it might be.

11,140. (*Mr. Mathews.*) It was also stated that, if it were true, the workman had a remedy against his master before the magistrate?—Yes; those are the principal points which I wished to put before the Commission, as well as putting in certain documents. I also brought here, in case there should have been any question about the wages, the detailed wages sheets which are printed. I simply bring these tabulated reports here to substantiate if necessary the abstract statement which I have drawn. I will leave all these papers in the hands of the Commission, that they may refer to them if need be. I presume that these documents, which have been obtained in some cases with some little difficulty, will be returned to me after they have been used by the Commission.

The witness handed in the following paper:

COMPARATIVE WAGES.

Early part of 1863:
Puddling Grey Pig, 7*s.* 6*d.*, 7*s.* 3*d.*, 7*s.*, 8*s.*
Hammering singles, 9*d.*, 11$\frac{2}{10}$*d.*, 11*d.*, 11$\frac{1}{2}$*d.*
Do. doubles and trebles, 1*s.* $\frac{1}{10}$*d.*, 11*d.*
Rolling, 1*s.* 1*d.*, 1*s.* $\frac{1}{4}$*d.*, 10*d.*

April 1864:
Puddling, 10*s.* 6*d.*, 10*s.* 6*d.*, 10*s.*, 10*s.* 3*d.*, 11*s.*
Hammering singles, 1*s.* 2$\frac{3}{4}$*d.*, 1*s.* 1$\frac{1}{4}$*d.*
Do. doubles, 1*s.* 4*d.*, 1*s.* 7$\frac{3}{4}$*d.*
Rolling, 1*s.* 3$\frac{1}{2}$*d.*, 1*s.* 1$\frac{1}{4}$*d.*

Wages 1866—Strike against 10 per cent. reduction.
Puddling, 10*s.* 6*d.*, 11*s.*, 9*s.* 6*d.* ordinary.
Hammering, 1*s.* 1*d.*, 1*s.* 1$\frac{1}{4}$*d.*
Rolling, 1*s.* 2*d.*, 1*s.* 7*d.*

Revised wages 1866:
Puddling Grey, 9*s.* 6*d.*
„ Mottled, 8*s.* 6*d.*
„ White, 8*s.*
„ Plate, 7*s.* 6*d.*
„ Mixtures *pro rata.*
Hammering singles, 1*s.*
Do. doubles, 3*s.* 4*d.*, 1*s.* 3$\frac{1}{2}$d.
Rolling Puddled bars, 11*d.*

Reduction of 1867:
Puddling Grey, 9*s.*
„ Mottled, 8*s.*
„ White, 7*s.* 6*d.*
„ Plate, 7*s.*
„ Mixtures, *pro rata.*
Hammering, 1*s.*, less 10 per cent.
Rolling, 11*d.*, do.

Reduction of December 1867:
Puddling Grey, 8*s.*
„ Mottled, 7*s.*
„ White, 6*s.* 6*d.*
„ Ordinary Plate, 6*s.*
Hammering singles, 8*d.*
„ doubles, 10*d.*, 1*s.*, 3*s.*, and 4*s.*
Rolling, 8$\frac{1}{2}$*d.* or 10*s.* per day.

The witness withdrew.

Mr. WILLIAM CLAY examined.

11,141. (*Chairman.*) Are you the manager of the Mersey Steel and Ironworks?—Managing director.

11,142. How long have you held that post?—Sixteen years.

11,143. Have you had during that time dealings with the puddlers' union?—Of late years only—in the last five years; we were not troubled with them before.

11,144. In what respect have the puddlers' union affected you. You say that you have only been

Mr. W. Clay.
10 March 1868.

troubled with them during the last five years. I presume there has been some change in the course of business which you attribute to the action of unions?—Yes; prior to 1863 we had never heard of this puddlers' union, or had anything to do with it. At that time a deputation from the parent society in Staffordshire visited Liverpool and induced some of our men to join the union. I was informed by the foreman at the time of what was going on; but we had always got on so pleasantly with our men, that I thought it was a matter of no consequence, and took no notice, but allowed the men to join the union or not, just as they pleased.

11,145. (*Mr. Mathews.*) Do you know the names of the men who formed the deputation to Liverpool?—I do not know the names of those men. I know the name of the local secretary of the district, in our works.

11,146. You do not know the names of any of the men who came from South Staffordshire?—No, not any of them. To proceed with my story: Within three or four months of my having that information that the society in Staffordshire had formed a branch in our works I began to find more difficulty in dealing with my men. I began to have complaints about trifles which formerly were never thought of, and altogether the management of the works became much more difficult and complicated, because it became necessary, in matters in which the interests of the workmen were as much bound up as the interests of the employers, to consider what view the men would take of any of those changes which are continually necessary in the carrying out of a large ironworks.

11,147. (*Chairman.*) Will you give us an example of your statement—that it became necessary to consider the view which the men would take?—Yes, I can give you an example in point. We built a new work, and in this work we had very improved machinery, the steam hammers instead of the old-fashioned hammers formerly in vogue in the trade. It was necessary for me to consider that in the excited state in which workmen then were, instead of offering less to the men who went to these new hammers, and instead of the firm having the benefit from this large outlay of money in improved machinery, we should have to give the same wages per ton with the improved machinery as the men had with the old machinery. The workmen would earn very much larger wages per week or day in consequence of the improved machinery, but had I offered such wages as would have made their weekly wages equal to that of other men in the same branch of business, there would have been a difficulty at once. And knowing that, I avoided creating such a difficulty, and for many months—in fact for two or three years—we paid in that department most extravagant and extraordinary wages; wages which the trade could not afford.

11,148. According to your statement, your outlay for the improved machinery was of no advantage to yourselves?—No advantage to us in respect of cheapening our manufacture.

11,149. It was of advantage to the men?—It was of advantage to the men. It was some advantage to the firm, because we could do larger work with it; but still one collateral advantage ought to have been a diminution in the wages per ton, because there was a considerable diminution in the work that the men had to do, and because they were able to do much more in the same time and with more ease to themselves.

11,150. (*Mr. Roebuck.*) So that an advantage was derived by the workmen from the influence of the union at your expense?—Yes; it was undesirable in those times to have any strike, and rather than cause a stoppage of the work which would have been inevitable, I had to submit to what I considered at the time was a great injustice.

11,151. (*Chairman.*) Were these the puddlers that had this advantage?—The shinglers, or rough hammerers, or nobblers, as they are sometimes called.

11,152. (*Mr. Harrison.*) Were any representations made on the part of the union about the machinery?—No, none whatever, but I was perfectly aware what the consequence of a reduction of wages have would been, and I was not desirous to put myself into collision with a society in a distant county at that time.

11,153. Still you have no direct evidence which connects the high wages you were paying with any specific action on the part of the union?—I think I can give you some evidence of what has occurred since in that very department.

11,154. (*Chairman.*) Before you pass from that I want to know whether the shinglers' wages became disproportionately high as compared with those of the other workmen that were employed in producing iron in your factory?—Yes, in the proportion of 300 per cent.

11,155. And that continued during the time you speak of?—Yes, shinglers are always highly paid, but they were getting for the same amount of labour, and as common a description of labour as puddlers, between three and four times the wages.

11,156. (*Sir D. Gooch.*) How much were they getting?—9*l.* a week, after deducting all expenses.

11,157. (*Lord Elcho.*) What were these men who were getting 9*l.* a week?—They were under-men promoted to this very kind of work on the new hammers. They would have got where they came from 5*l.* to 6*l.* a week as forehands.

11,158. (*Mr. Harrison.*) But do you know that the men who were working on this particular machine were really members of the Staffordshire union?—One of the individuals was the secretary, and the instance I was going to bring before your notice was this. The thing went on for about a couple of years, and then, not content with these enormous wages, they were urged (as it was stated, though I have not it in direct evidence) by the head society in Staffordshire to take an exception to paying the hammer-driver. It was a custom with us, but it appears that it was not the custom in Staffordshire for the shinglers to pay the hammer-driver; in fact, they have very few such hammers in South Staffordshire. They had, as it was represented to me, an order that they were not to stand paying the hammer-driver out of their wages. I should mention that their gross wages were much higher than 9*l.*—9*l.* was left net for the men after the week's work to each shingler.

11,159. (*Mr. Mathews.*) From your knowledge of the economy in your work and from the intercourse which you know your men had with the union, you have no doubt of those facts?—I have no doubt of those facts. I was informed by the foreman, who was pretty well acquainted with what was going on, that an undercurrent of agitation was going on on the part of these workmen who were getting these high wages, trying to induce the men in a similar position in our main works to come and demand that the wages of the hammer-driver should be paid out of the office, and that they should be relieved from that payment. The hammer-drivers who had been with us a great number of years—from childhood—declined to enter into any such arrangement. The labour market generally was very much disturbed at that time throughout the whole of our neighbourhood, so much so that dock labourers were demanding from the merchants of Liverpool 20 and 30 per cent. advance in wages, and our labourers made a similar demand. This necessitated the closing of the works, and I took that opportunity of putting ourselves clear of the puddler's union.

11,160. (*Mr. Roebuck.*) How did you put yourself clear of the puddlers' union?—When our labourers demanded higher wages the state of the iron trade would not afford it, and we, therefore, declined to give them higher wages, and they gave us information that they would leave the work. It was then of course impossible to carry on the remainder of the work with the labourers all away; so I gave the men regular notice that the works would close. At the expiration of that notice I had a deputation from the men of the puddlers' society. I should observe that the labourers striking had nothing to do with them,

and I asked them if they would wheel in their own coals and red ore, and do other rough labour, which the labourers had to do, otherwise I could not possibly carry on the work. There was a considerable amount of agitation and uncomfortable feeling about that time, and finally when the labourers did return to their work at the old rate of wages, I gave notice that for the future I would not employ any workmen that had any connexion whatever with the puddlers' union of Staffordshire. A deputation of the men came to me and said, Now they knew what they had to expect—and it would be war to the knife—they should strike, and they would take care that we should not get any men. Our directors had come to the determination that the works should close rather than have them carried on in the very unsatisfactory manner in which they had been carried on for the past three or four years. On the following Monday morning I commenced work with four puddling furnaces and two ball furnaces. Having been practically acquainted with the manufacture of iron myself from my youth, I went with my men and told them that we would all be blacklegs together, and brought the iron down, and as there was a deficiency of rollers, I rolled the first round myself. I had a very excellent foreman who assisted me, and the result was that we carried on this strike for 13 weeks. At the end of that time we had increased our four puddling furnaces and two ball furnaces to 18 puddling furnaces, and five ball furnaces, all of which carried on by men who had no connexion with the union.

11,161. (*Mr. Mathews.*) You did not work yourself all that time? — No, I did not work myself all that time. I may say that in my father's ironworks I made myself practically acquainted with every branch of the iron manufacture, and that I have found it of very considerable use. At the end of this time, I have been informed (it is hearsay evidence only) that the authorities of the club in Staffordshire sent word down to the officials of the branch at Liverpool stating that it was no use carrying on the strike any further—that they were beaten, that the masters and foremen there were too practical for them, and that they must return to their work on the best terms they could. Intimation was given to me by the foreman that the men were ready to go back to their work, and I said, "Well, you will bring them "in by pairs. I will not have them in as a body, and "I shall certainly not take on any man that will not "pledge his word that he does not belong to the "union, and that while he is in our service he will "not belong to the union." And I had some written papers to that effect. I think the wording of them was somewhat the following: "I hereby engage that "I do not belong to the puddlers' union, nor will I "during the currency of my engagement with the "Mersey Steel and Iron Company belong to that "body, or have anything whatever to do with it, and "should I do so, I agree hereby to forfeit any wages "that may then be due to me." These men then came in and signed this paper and left the union. The ringleaders, who I considered had done much more damage to their own fellow workmen than to the Mersey Steel and Iron Company, I refused to take back. With regard to the two men I mentioned just now as having obtained each of them their 9*l.* week net, one of them has written to me several times since offering to come back on any terms, or asking for a recommendation to other works. I have offered to give him a recommendation to other works, but I said that I must in honesty state the reason why he left ours. I believe that since that time he has hardly had a week's work—not that it is known to other employers who he is, for his name has never been published, and no notice has been given to any other ironmaster on the subject—but partly from slackness of trade, and, as I am informed, he has been in great trouble and want since then. Out of the large amount of wages, 9*l.* a week, 400*l.* or 450*l.* a year, he has saved nothing, and since that time, from want of work, he has, I am told, been in great distress. The other man has worked at what is technically called his butty. I have since taken back and allowed him to work as best he could, but since then our establishment has been considerably reduced, and he could only work occasionally with the other men. I know that he has been very badly off indeed. He has saved nothing out of his large wages, because he has been at my house on two occasions since, within the last six months, begging for a few shillings to bury his children who had died. I may mention that that man was entirely led by his society; he was himself an innocent individual who would have done no harm, and would have stuck by his employers if he had not been coerced into opposition.

11,162. He has not been kept out of employment in consequence of belonging to the union?—No, he has been with us ever since; but there has only been slack work. I may mention that at the time when the iron trade was in a state of considerable activity I could not, I dared not, take large contracts, because I could not see my way to fulfil them. I might have filled my order book up then for many months of the future, instead of which I steadily refused to entertain any orders whatever. Shortly after that these depressed times in the iron trade took place, and we necessarily had very little to do, and one necessary consequence was, that when we got a large stock of the raw material, puddle bars, it became necessary to close one of our branch works, and it was in that way that this man was often out of work. We endeavoured to keep the men together as much as we could, and divided the work amongst them as well as we could, but he has only been on partial work ever since.

11,163. (*Mr. Booth.*) You have stated that at the commencement of that strike the men said that you should not get other workmen. Did they take any active steps to prevent your getting other workmen?—The means we took to get workmen was to advertise the thing to the ironworkers in the iron districts. We had from several men answers to these advertisements, stating that they would come. We know that some hundreds came, but they were met by pickets of the workmen on strike, their expenses paid to take them home again, and they were not allowed to come near the works.

11,164. (*Mr. Roebuck.*) When you say "not allowed to come near the works," what was done to prevent them?—In the first place, they were told that the men were on strike, and that they were going to take bread out of other men's mouths, in fact the usual arguments were used.

11,165. Was it only done by arguments or were there any threats?—I had several complaints, not only of threats, but of actual force; but as is usual in those cases, I never could get hold of the necessary evidence. In several cases my foreman came to me and said, that he had got a case that would do to take before the magistrates, but when I got our solicitor to take the evidence down it all melted away.

11,166. Do you think that melting away was because there was no evidence, or that the men were afraid?—They were afraid.

11,167. What evidence had you that they were afraid?—In the first place, the men came under a sense of injury, and having suffered assault and battery; the first complaints made to me were very positive, and they seemed determined to punish the people that had assaulted them, but the great effect of seeing a legal gentleman taking down in writing what they were going to say frightened them.

11,168. So that they told one story to you, and they told another story when called upon to state it to your legal adviser?—Yes.

11,169. Do you suppose that that was caused by fear or by anything peculiar to the effect of a lawyer upon a man's mind?—I think that that class of men have a particular horror of anything like a lawyer or evidence being taken down.

11,170. (*Mr. Booth.*) The dissuasion was suffi-

Mr. W. Clay.
10 March 1868.

ciently strong to prevent their coming to you for work as they had intended to do?—Yes; but now and then we got one that run through the blockade—I call it the blockade, for every railway station was perfectly blockaded.

11,171. Were any of those men that came to you ever molested afterwards?—No, never since the strike came to an end.

11,172. (*Mr. Roebuck.*) During the existence of the strike, during the time that they worked for you, were they ever molested?—Yes, several times; but I never could get sufficient evidence. Those men that I was certain in my own mind, although I had no legal evidence of it, had molested others, I regarded as ringleaders, and would not take back again on any terms.

11,173. (*Mr. Mathews.*) Your knowledge of the relations of these men in times of strike enables you to judge of the difficulty there is of getting any men in case of molestation to turn evidence?—Yes. In the higher stations of life we cannot understand the immense pressure brought to bear upon the working man when he does anything to displease his fellow workmen. For instance, take a man living in a narrow street or a court of houses. First of all he is simply assailed as blackleg, and told that he deserves to be killed, and so on, but after a while the wives and children take the matter up, and though he is a respectable workman wishing to live in peace and quietness, his doors are battered in, his windows broken, and no one knows who does it; and there is an immense amount of what is disagreeable and of actual damage done to the workmen and their families in that way.

11,174. And that fact is perfectly notorious to you?—Yes. We can hardly understand it, living as we do in isolated houses, and our neighbours having nothing whatever in connexion with us, we can hardly understand this state of terrorism brought to bear on working men. And not only men in their own line of business, but other men who belonged to societies, carpenters and boiler makers, and others, were in the habit of annoying them, and in some cases ill-treating them. In fact, I may mention that two or three of the assault cases which came to my knowledge were cases in which the assault was not committed by our late workmen, but by workmen of other societies, and it was stated that they did so at the instigation of our late workmen.

11,175. (*Mr. Roebuck.*) So that the trades unionists of all sorts made common cause?—Yes, but because our men would have been recognized and known, they in a sort of mild way obtained strangers not known, to come and assault these men.

11,176. (*Chairman.*) To what extent did the violence go?—Not to any very great extent—not to the extent of injury to either life or limb; nothing more than a good pummelling. One or two of them got knocked down.

11,177. (*Lord Elcho.*) Did the men who came to you bear any marks of personal violence about them?—Yes, there were two cases in which they did.

11,178. Yet when it came to giving evidence those men did not come forward?—No.

11,179. Have you any reason to doubt when they come to you, the statement made by them that injuries were so received?—Not at all. There was one case which I could not entertain at all. One of the men had got into a public house though he had been warned against going there, as there was a likelihood of being brought into collision with his late fellow-workman. They were told that they had better keep in their own houses and avoid publichouses. In one case he had neglected that, and had gone into one and been drinking, and was more or less intoxicated when the row took place, of course therefore he could hardly give a distinct account how it happened.

11,180. But the other case was different from that?—Entirely different.

11,181. And you had distinct evidence that the injury was done by the unionists?—No legal evidence, but quite clear to me.

11,182. Was the statement substantiated in any other way?—We have often had two or three witnesses to an assault.

11,183. (*Mr. Roebuck.*) But you found it difficult to connect the assault with the union?—Yes, it was very often done under cover, a lot of men were in a crowd, a blow was given, and it could not be positively said by whom the blow was given.

11,184. (*Mr. Merivale.*) Were there any cases in which you were able to convict an individual of the assault although you could not bring it home to the union?—No, the evidence always melted away—we believed that we knew the man who struck the blow but there is no use in your going before a magistrate unless you are positively prepared to prove facts. It generally went off in that way.

11,185. (*Mr. Harrison.*) You call this a strike, but it was a lock-out, was it not?—It was hardly a lock out or a strike.

11,186. You refused the men work; it was not they who refused to work for you?—I refused to take back men who belonged to the union. It was not a lock-out. The men were legally discharged in every way. The works were as it might be a new works starting there—and I stated "In carrying on these works for the future I will not have union men."

11,187. It was a lock-out to suppress the union, was it not?—No.

11,188. (*Mr. Roebuck.*) First of all, if I understood you rightly, the trade became unremunerative, and you determined to close your works?—No, that came some time afterwards. First of all, an agitation was going on through the works, and I was informed that if this concession to the hammermen was not granted a strike would take place. Then the difficulty came with the ordinary labouring who had nothing whatever to do with this society, and the works were then idle for a week or two in consequence of the want of labour. At that time when the works were actually stopped, and the men legally discharged, I made this intimation to them: I said that we had had so much trouble with the union men that we would not employ any for the future.

11,189. Did it begin thus. There was a difficulty with the labouring men and you told the puddlers that without them you could not carry on the works and therefore the works stopped?—Yes.

11,190. After that when the labouring men came back you began upon a new system?—Yes.

11,191. And that new system they refused?—Yes.

11,192. And thereupon was it your proceeding to say that you would not go any further and you therefore shut the works?—We closed the works because of being unable to obtain the rough labour in the first instance. Then when they were closed we considered the matter over, and the men being all legally discharged, we said, "We have had so much trouble, we will not have this again, we will not take back any workman who belongs to the union."

11,193. Then it began with you, you took the initiative?—Yes, but it was hardly what is popularly known as a lock-out.

11,194. (*Mr. Harrison.*) It was not a combined lock-out, but you said, "We close our works until the men working for us cease to belong to the union"?—We closed the works for another cause, but we would not open them again unless the men ceased to belong to the union.

11,195. There had been no specific strike between the company and the puddlers?—No there was no strike and no lock-out, we were simply making re-engagements, and I said, "When making reengagements I will avoid those men who belong to the union."

11,196. (*Mr. Mathews.*) You found from experience that you had had so much trouble with these unions, first with the puddlers' union, and then with the labourers' union, that your directors came to the conclusion that it was impossible to carry on your works if these unions existed in them?—Yes.

11,197. Thereupon you elected to employ those men who did not belong to the unions instead of those who did belong to the unions?—Yes.

11,198. And you have found no difficulty in getting the work done by men who do not belong to the unions?—No.

11,199. You have them manned now by men not belonging to the unions?—Yes.

11,200. And now having got your works manned by men who do not belong to the unions you do not experience that interference and annoyance which you did experience when your men did belong to the unions?—We never have the slightest now.

11,201. Your action cannot be called a lock-out because you did not lock-out the men provided they would come and work upon the terms you prescribed?—Just so.

11,202. (*Mr. Harrison.*) Do you call it a strike?—No, but I rather anticipated a strike at the time.

11,203. (*Mr. Roebuck.*) How did you ascertain that these men that you took on were not connected with the union?—Merely by their own word.

11,204. And there was no interference on the part of the union, as far as you could understand with the actions in your works?—Since then, none whatever.

11,205. So that as far at least as you are concerned they are not connected with the union?—They are not.

11,206. They may be nominally I suppose?—I think they are not.

11,207. (*Lord Elcho.*) They have all signed a paper I think you stated?—Only those who came in at that time, but those who have come in since then have not signed any paper. If I had known as much in the year 1863 of the pernicious effect of these unions as I do now, we should never have been troubled with them at all, because we should merely have had to dismiss two or three men in the first instance who propagated the system through the works. As I have said I was informed at the time that they were doing so, but I thought it of no consequence and did not take any steps to put an end to it.

11,208. (*Sir D. Gooch.*) I suppose you do not object to unions if they do not interfere with your works?—Certainly not. We have indeed one sort of union which every man in the works must belong to, namely, a benefit society. We assist them with donations and receive money for them at the office which is paid over to their own secretary. That, however, is merely a benefit society.

11,209. (*Lord Elcho.*) Since you have reopened your works on the principle of having no men belonging to the unions, have the wages which those men have received been equal to the wages received by men belonging to unions and employed in other works?—They have been rather higher wages than those paid in other works. I may state that between the time of these unions first coming near us and this last strike two years ago, we had a small strike of a few of the men which lasted for some little time. It was entirely on account of the unsettled way in which they worked, and this is how it happened. On the 19th of April a season which is not generally very hot in our works and one in which we never lost a day's work before for heat, (that does sometimes happen in other works, but we have the advantage of the river Mersey and a sea breeze so that ours are very cool works,) a portion of the men suddenly put on their coats and went home in the middle of the day. We knew that we could not carry on the works if that was to take place without notice, and I had some of the ringleaders taken before the magistrates. The magistrates found a technical difficulty in the matter, and said they hoped that the matter would be smoothed over, but the men did not go back to their work for many weeks.

11,210. (*Mr. Mathews.*) Had you any special contract with those men for giving notice?—No special contract, but we pay weekly and that makes their engagement I believe legally from week to week.

11,211. I understand that the Liverpool magistrates dismissed the summons on the ground that there was no special contract as to time between you and the men?—There was no written contract.

11,212. That is to say on the ground that there was no special contract that they should give a week's notice or receive a week's notice?—I do not think that that was the ground.

11,213. (*Mr. Harrison.*) What followed upon that decision of the magistrates?—The men remained out of work for a considerable time until it suited them to come back again, and when they came and expressed contrition for what had happened and desired to come back, I took them back. In the meantime we carried on most of our works without them.

11,214. (*Mr. Roebuck.*) Did you want labourers in the meantime—were you pinched?—We had $\frac{7}{8}$ths of the works going.

11,215. How many men do you generally employ?—1,800 to 2,000 men and boys when in full work.

11,216. (*Mr. Mathews.*) How many are you employing now?—I do not think more than 1,200. One or two of the departments have closed entirely.

11,217. Your work is not strictly speaking an iron-work, similar to those in Middlesborough, or Staffordshire, is it?—Our specialty, as the French would say, is forging for ships of war and steamers. We have made most of the large axles for the iron-plated vessels in Her Majesty's Service.

11,218. (*Mr. Roebuck.*) Have you cast any guns?—We have forged some guns. The monster Horsfall gun used in the Russian war, a 13-inch gun weighing 22 tons, was made at our works.

11,219. (*Lord Elcho.*) Is that the only one of that size which you have made?—Yes.

11,220. (*Mr. Mathews.*) You work is exceptional in the trade?—Yes; still we make large quantities of bars.

11,221. For your special work you require very skilled workmen?—Very skilled workmen.

11,222. And they require very high wages?—Yes.

11,223. When the men had unions did the unions extend to that department?—No, only to the ordinary iron making departments.

11,224. In addition to that special work you are

11,225. And of armour plates?—Yes, armour plates and ship plates.

11,226. (*Mr. Booth.*) Are the men paid for daily work or are they on weekly wages?—Chiefly by the ton.

11,227. (*Mr. Mathews.*) Can you have payment by the ton, and at the same time an agreement that they should give or receive a week or a fortnight's notice before leaving as is the case in South Staffordshire?—We have hardly ever had the question arise.

11,228. You have no contract whatever?—A man is engaged by us, and if we are dissatisfied with the man's work or conduct in any way, we give him one week's notice, and he can give us the same.

11,229. (*Mr. Booth.*) Those men to whom you have just referred, in fact broke no contract by leaving in the middle of the day?—We considered (we may be wrong in point of law) that a weekly hiring was an engagement for a week.

11,230. How was it a weekly hiring?—Because we paid the wages weekly. We were informed by our solicitor that as we paid our wages weekly, and gave the men a week's notice, when we desired to get rid of them they were bound to give us a week's notice.

11,231. (*Mr. Harrison.*) You refused to take them back you have stated?—We refused, because of course they might have stopped in the same way the next day, or the day after, or any day they pleased.

11,232. You, failing to get a decision in your favour before the magistrates, locked them out until a certain time when you chose to have them back again?—We declined to have them back on the terms that they were at liberty to leave off work when they pleased.

11,233. What were they to do in order to receive work again from you?—All they had to do was to promise me that they would not leave off their work without reasonable cause again, and when they gave

me that assurance they came back to their work, but in the meantime they suffered very great poverty for many weeks.

11,234. (*Mr. Roebuck.*) When they came back to you did they not make a special contract with you, meeting the views of the Liverpool magistrate?—No. I said, "We cannot carry on our works if you are to be "at liberty to come and go just as you please, but if "you are willing to come back and abide by your "work we will employ you again."

11,235. (*Mr. Merivale.*) Did you put it to them that they were to give a week's notice?—No. I may mention, and ought to mention, in justice to the society in Staffordshire, that I believe that that strike among that small portion of your men never had their sanction or support.

11,236. (*Chairman.*) I do not understand why the men took off their coats; did they not say, "We want more wages?—No, they only said (after leaving work) "It is too hot."

11,237. What was the meaning of that step?—They were getting very high wages; moreover, it was one of the rules of the club that five days a week was quite enough for any man to work, so they said, "To-day is a hot day, and an unpleasant day, we will go away to-day and come back to-morrow."

11,238. (*Lord Elcho.*) There would be no question, would there, of the South Staffordshire Union, or any other union, supporting the men in such a strike, because they were not unionists then?—Yes, they were unionists then.

11,239. I thought you were referring to a strike that occurred since you refused to take unionists?—No, I have put the cart before the horse; I mentioned the first strike after the second.

11,240. (*Mr. Merivale.*) How long ago was this first strike?—Four years ago. The last strike, when we beat the men so completely, was two years ago.

11,241. (*Mr. Mathews.*) You took exception to these men leaving their work. They stated that the weather was very hot, but in cases where the weather is really very hot the masters generally allow them to leave, do they not?—Yes.

11,242. But inasmuch as when a puddler leaves his work he throws out other men you are obliged to exercise some scrutiny into the causes why they do leave?—Yes.

11,243. (*Mr. Roebuck.*) Not only do they throw other men out of work, but they cause fuel to be consumed uselessly?—Yes, a large amount of fuel; nearly as much as if the works were going on.

11,244. (*Lord Elcho.*) Do you know at all what proportion in your works of your 2,000 men were unionists, and what proportion were non-unionists?—In the particular branch of puddlers, shinglers and rollers, what are called forge men, I believe that just at that time almost the whole of them belonged to the union.

11,245. And what proportion did they bear to the whole of the men employed, whether as labourers or in any other departments of work?—Not above a fifth or a sixth. I should mention the fact that for some two or three months, and going further back than that before this strike, I was informed by the foreman that some of the men who had objected to join this union had had pieces of hot iron thrown at them across the furnaces, and had been threatened and assaulted as far as that goes. It was pretended to be accidentally done, but in reality it was done on purpose. Several of the men came to the foreman and said they were afraid that they would have to join the union against their will, they had joined several unions before and found that they were decidedly against the interests of the workmen, but they were afraid that they would be obliged to join or else they would get almost murdered. When I was told this I sent word that there was no need for them, unless they pleased, to join the union, that they should have every protection that I could give them. It was also threatened that the men were going to strike against them. They had at an evening meeting once stated that unless the three or four men who were not in the union joined they would strike against them. I sent word to those men that if only one man remained who did not belong to the union I would uphold that one man against the mass rather than be dictated to in that way. I think that eventually they were all or nearly all belonging to it, though there were two or three exceptions.

11,246. But under the new system there were some men who were employed as shinglers, who received 9*l.* a week, working on this new machinery you have spoken of.—Yes.

11,247. Are there any men receiving that now?—Not in that department, but in other departments we have men receiving higher wages. Our two chief hammermen have from 700*l.* to 900*l.* a year each.

11,248. Do you mean netting 700*l.* to 900*l.* a year?—Yes, one of them has 12*l.* 10*s.* a week, and the other 11*l.* 10*s.*, standing wages. Then they have perquisites of teaching apprentices; they get all the benefit from teaching apprentices. It is our interest, of course, to have young men brought up to this valuable business, and we pay them an ordinary man's wages while they are apprentices, and these chief hammermen who teach them get the difference between about a pound a week and 60 or 70 shillings a week, which would be their wages if they were journeymen.

11,249. Do you pay the apprentices, or does the hammermen?—We pay to the head hammerman all the wages, and he pays those under him.

11,250. (*Mr. Roebuck.*) Are you at all aware whether those men who make this 700*l.* or 900*l.* a year pay income tax?—Yes, they do.

11,251. (*Mr. Mathews.*) When you speak of the hammermen, that is a special department of work?—Yes.

11,252. Not in the ordinary iron-making department?—No.

11,253. Such a workman is very scarce; he is very adroit and very skilful?—Yes. Our chief workman finished a piece of work last week worth 2,500*l.*; by the slightest carelessness on his part it would not be worth as many pence. I refer to a piece which I am now supplying for the main crank shaft for a war vessel of the Austrian navy of 1,000 horse-power. I also supplied Mr. Penn with the main shaft for the "Hercules" which was 34 tons 11 cwt. I think the invoice for that was 3,500*l.*, and the slightest carelessness on the part of the head workman would have made that perfectly valueless.

11,254. Then the perfection of work depends entirely upon that one man?—Yes.

11,255. In the case of armour-plates, if the armour-plates are rejected, they are perfectly valueless, are they not?—Almost so.

11,256. They can only be cut up by slotting, and the expense of slotting is almost as much as you obtain by it?—Yes.

11,257. (*Lord Elcho.*) With regard to those men who receive 700*l.* or 800*l.* a year, have they had any scientific education?—Not at all.

11,258. They are practical men who have risen from their energy and common sense; physical strength and a good eye have brought them to that?—Physical strength is not specially wanted; they are men of extraordinary tact and common sense. One man who was in a similar position with us is now the owner and head of a large work, employing 1,500 or 2,000 men.

11,259. (*Mr. Roebuck.*) So that these men making those large wages are very often thrifty men, and make money?—Yes, in the case above mentioned. I think that my two hammermen could find between them a good round sum of money, but of course I do not pry into their affairs.

11,260. Do you find, generally speaking, that the highly paid workman is a thrifty man?—No, rather the reverse, as is illustrated by the two cases which I mentioned of men getting 9*l.* a week who have never saved a farthing, and when thrown out of work they are immediately in distress.

11,261. Never having saved a farthing, was their money spent in debauchery, or had it been merely

thrown away?—Not in debauchery exactly, but in quiet drinking perhaps, and I dare say a good deal was spent in buying tawdry ornaments and dresses for their wives and families.

11,262. (*Mr. Booth.*) Those were union men?—Yes.

11,263. (*Lord Elcho.*) Are your two hammermen whom you have referred to educated men; can they read and write well?—Moderately well.

11,264. (*Mr. Mathews.*) If those men had had a scientific education in early life, do you not think that it would have vitiated their chance of becoming the accomplished workmen that you have described them to be now?—I am hardly prepared to say so.

11,265. Those men began to work as boys?—Yes.

11,266. They worked under their fathers as boys, probably?—Yes.

11,267. And now they have become accomplished mechanical operatives; all that has been practice?—Yes.

11,268. If they had devoted that time to the theory of scientific education, do you not think it would not have damaged their adroitness in their present department?—I do not think so. Although I do not set so much value on technical education as many people, still I would not go so far as to say that because a man has had a technical education that would disqualify him from being a good workman.

11,269. (*Sir D. Gooch.*) That is not quite the question put to you; but supposing a man devotes the time in which he may be acquiring practical knowledge to technical education, would he be as good a workman?—No, he would not be as good a workman. I may observe as to those two head men I have mentioned, that when they leave their work in the evening, their day's work is not finished; they are thinking (and they must think several days a-head) what they are going to do to-morrow, and if things are not going well, they cannot sleep at night sometimes.

11,270. (*Mr. Roebuck.*) That is the case of a man having arrived at the goal. But taking the case of a young child or boy, could he not employ enough of his time in practical work to become an exceedingly adroit manipulator, and at the same time improve his mind by education, is he obliged to employ his whole time in practical work in order to acquire that expertness in manipulation?—No, I think not. I think he might have some time for education.

11,271. You could combine the two so that at the same time that a boy was acquiring great expertness in his business he might also employ his mind in the acquisition of scientific knowledge?—Yes, to a certain extent, but he would not have a great opportunity for doing that as a child, after his work for the day was done.

11,272. (*Lord Elcho.*) When grown up he might have time for it?—Yes.

11,273. (*Mr. Mathews.*) Do you think that many of these men whom you have described have much taste or inclination for scientific studies?—No.

11,274. (*Sir D. Gooch.*) They are too much worn out for that?—Yes, after their day's work.

11,275. (*Chairman.*) Have you a great pressure put on by your hammers?—Our largest hammer is 8 tons, falling 6 feet, which is an enormous blow.

11,276. (*Mr. Mathews.*) Equivalent to how many tons?—Authorities differ a good deal, and experiments which I have been making this last week lead me to believe that none of them are right.

11,277. (*Sir D. Gooch.*) It is a matter of figures, it is not?—I think not entirely.

11,278. (*Mr. Merivale.*) Might not a scientific knowledge on the part of a workman help him to get at such facts?—I hardly think it is the part of a workman to go into those questions.

11,279. An educated workman would be better able to form a judgment on such questions when it came to his time to form a judgment on them than one who had had no scientific education?—I think a few grains of practice is worth a good deal of theory.

11,280. Still you say they all differ now?—Yes, the theorists do. Calculations are easily made about the weights of a falling body, but I have an impression on my own mind that the rule is not constant.

11,281. It is an accruing force you admit, I presume?—Still I think there are limits to it.

11,282. (*Mr. Mathews.*) Do you remember any of these accomplished workmen you have been describing to us ever being able to work out a mathematical problem of that sort?—No, I may say that they are giving their children a good education.

11,283. Do you think that any of the children they are now educating so well are likely to make as good workmen as their fathers?—I am sorry to say that they are not bringing them up to the same business.

11,284. (*Chairman.*) What is your feeling with regard to piece work?—With regard to these large and important pieces of work, there might be a tendency under a system of piece work to slur that work, but in the ordinary work of the iron trade it is absolutely necessary to have piece work.

11,285. (*Mr. Harrison.*) You think that the tendency of piece work is to slur work?—Yes, to a certain extent. There is a corrective to that, however, in that the men are not paid for defective work. But it is our practice always to pay for waste plates when they go to the market. It seems to have been made a point here that some masters practically confiscated the material the men had made, because it was not up to dimensions, although the master sold it. Our invariable rule in rolling plates (it more especially applies to that) is that if the plates for any reason will not suit the order for which they are made, yet if at any time they can be cut into other sizes, we allow the workmen for them.

11,286. (*Mr. Mathews.*) With regard to piece work, there is no objection to their doing that superior work which you have described by piece work, except that they might try to get on a little too fast?—Yes.

11,287. But if the work was liable to be rejected after it was made, that would still prompt them to take all possible pains?—Yes.

11,288. But that would open the door to endless differences between you and your men?—Yes.

11,289. In point of fact, therefore, it is far better for you to shut out that danger by paying them handsomely by the day?—Yes. I may say that I have had cases in which I have thought it right, instead of scolding men for any bad work that has been done, to comfort them, and tell them how seldom it has happened. Some men, if they had two or three pieces of bad work consecutively would consider that their character was injured.

11,290. Since you have established the practice of employing only non-union men, there is no obstacle in the way of your men coming to you, but there is the freest understanding between your men and yourself?—Yes, there is not the slightest obstacle.

11,291. They can come to you, as in the cases you have cited, and with cordial sympathy?—Yes.

11,292. Do you think, if all your men had been in the union, there would have been that cordial intercourse to which you have alluded?—Certainly not; I have always been on the best terms with my men except on that occasion when the club interfered with us. They have come to me whenever they have had a grievance. In fact, we have always made a practice of advancing wages without their asking.

11,293. (*Lord Elcho.*) Do they come in a body or one or two of their number at a time?—One or two of their number, or sometimes those working at a particular furnace will come to me.

11,294. The absence of the union has not caused any difficulty from there not being any special person to communicate with?—Quite the reverse. About a month or six weeks ago the men, through their foreman, informed me that they were desirous that we should reduce their wages 10 per cent; they were quite willing to do so in the hope that it would enable us to take more orders, and so give them more work.

Mr. W. Clay.
10 March 1868.

11,295. (*Sir D. Gooch.*) What is your general idea on piece work as affecting the men—the advantage of piece work to the working classes I mean?—As a general rule most branches of the iron trade could not be carried out without it.

11,296. Do you believe that piece work is a more beneficial arrangement than day work between master and man, because a good man gets higher wages under the piece work system?—Yes.

11,297. Therefore, as far as regards the interests of the working classes, you think that piece work is in their favour?—Yes.

11,298. (*Mr. Booth.*) Where the circumstances admit of it, you think it is in their favour?—Yes, because every man gets paid according to his ability.

11,299. (*Mr. Roebuck.*) Are the majority good workmen?—The majority of the men in the iron trade are good workmen, in fact a man who is not has to leave the trade.

11,300. If they are all competent, one is not much better than another?—There is not a very great difference. If I may put it in figures I should say that there is not 2½ per cent. difference between my puddlers at the present time.

11,301. (*Lord Elcho.*) Have you in your own works at the present time, in the absence of union men, a greater difference in the rate of wages given to enm than there would be where unionists are employed?—No, I think not; those exceptional cases which I have mentioned about the shinglers do not exist now, and there is no great difference now.

11,302. I mean do you enable individual men to gain more than they would in consequence of the union rule that they must not exceed a certain amount of work?—That rule never applied to the iron trade; there never was a limitation that a man was only to do a ton of iron in a day when a good workman could do 24 cwt.

11,303. Take that case of the machinery you erected, a difficulty occurred there because you wanted to reduce the men's wages in consequence of that improved machinery?—I avoided that difficulty.

11,304. You expected a difficulty if you attempted that?—Yes.

11,305. And you would have paid those men higher wages, if the union men had remained with you, than you thought they were worth?—Yes.

11,306. Since then have you made a corresponding change in the rate of wages?—No, but that particular hammer has not been at work since.

11,307 (*Chairman.*) Did the men who earn 900*l.* a year work in the lower branches at the beginning of their career?—No, they began as apprenticed hammermen under their fathers in the first instance. Until they were 21 years of age each of them would be under his father's control and he would give him only pocket money. When emancipated from that control they would begin to receive, one 3*l.* 10*s.* and the other 4*l.* a week.

11,308. How came those men to come up to 900*l.* a year. Was it by a combination of acuteness and strong nerves and sound faculties; were they men peculiarly gifted by nature?—They were men peculiarly gifted by nature. I do not know where to get two other such men; I consider them the best hammermen in England.

11,309. (*Lord Elcho.*) No great physical power being required in their work?—No, they never need do any manual labour, it was never necessary.

11,310. Each of them began life in that department, I suppose?—He began in the lowest branch as a furnace boy, and then worked under his father till he was 21 years of age. He takes his coat off and always works in his shirt sleeves, because it would look strange in a workman to be going about with his black coat on, but otherwise he does not handle anything or lift anything now; he simply directs other men.

11,311. (*Mr. Mathews.*) They were accomplished workmen when they were 21, I suppose?—Yes.

11,312. Had a considerable portion of their time up to that age been spent in scientific education, do you think they would have been the accomplished practical workmen that they are now?—I think they might have devoted a portion of their time to educational purposes, but no doubt there is some risk of their mind being so engrossed by educational matters as to withdraw men somewhat from their own immediate pursuits.

11,313. (*Mr. Harrison.*) Do you think that a competent civil engineer who had devoted some years of his life to this particular study would not be competent to take the place of one of these men?—No, no theoretical man could do it.

11,314. I mean a man who had devoted a considerable part of his life to that pursuit practically?—Such men might go through it from lifting the door up as boys, and through all the different departments of daily training.

11,315. (*Mr. Booth.*) That is in fact for this purpose as you think the best technical education?—Yes, practice is the best.

1,316. You do not object to technical education?—No; but in my opinion practice is the best for this purpose.

11,317. (*Lord Elcho.*) What were those men's wages when they were 21?—About 4*l.* a week.

11,318. Is the quality of work which you have turned out under your new system in your belief equal to the work which you turned out when your men were unionists?—Quite equal, if not superior.

11,319. When they were all union men was the work generally as good as it is now; you have already said that it is not worse now than it was then?—I cannot say that there has been much difference, but if anything I should say that the tendency of the union upon the union men was to make them careless over their work, because they felt some confidence that their union would bear them out, and that they would not be visited with consequences that they otherwise would be. I ought to say that we have a number of union men in the works that are engineers, and we do not object to them because they have always behaved well. Indeed I believe that most of our engineers are society men but that society (it is now some years since the great strike that happened in their trade) seems to have been governed by much more reasonable counsels than other trades have been.

The witness withdrew.

Mr. J. Kane.
10 March 1868.

Mr. JOHN KANE further examined.

11,320. (*Chairman.*) You have already given some evidence here as president of the National Association of Ironworkers, but I think you wish to give some evidence in reply to what has been laid before us. Will you state what point it is you wish to address your evidence to in reply?—I wish in the first place, by way of putting myself right, to refer to a few statements made by Mr. Hobson. And I will refer in the first place to question 8763. Mr. Hobson, in reply to the Earl of Lichfield, stated that the confederation which was entered into was broken before the Sheffield conference. Now that is incorrect. The confederation which was agreed to by the men of the north of England and the South Staffordshire ironworkers was entered into in the month of June 1864, and no alteration took place until the Sheffield conference on the 26th of December 1864, and the only alteration which took place then was with the approval of Mr. Hobson and his colleagues, and it was simply in the wording of the resolutions, the objects remaining the same. I wish that matter to be corrected. Then in answer to question 8765 he states, "There was no resolution in regard to Staffordshire." That is in reference to the resolution which was passed at the Sheffield conference, in favour of north and south accepting the reduction. No amendment was

proposed, and yet both North and South Staffordshire were represented. By way of making this matter clear let me say that one of the resolutions which was passed distinctly states, "That a conference be held "for the northern and another for the southern section; "the executive of the north to attend the conference "of the south, and that the south be represented at "the annual conference of the northern section, and "that no action be taken by either party relative to "strikes before the matter has been fully ventilated, "and agreed to by both parties. Such disputes may "be caused by demanding an advance, or preventing "a reduction," this being the only way that will make the "two executives one in sentiment, one in "policy, and one in action." So that this deputation that attended at Sheffield was legislative as well as an administrative deputation as much as any delegate that was there, and the resolution that was passed applied to both north and south. That was the distinct understanding by that Sheffield conference. Then at question 8768 Mr. Hobson states, "We merely went "down to the conference to understand what resolu- "tions they came to in order that we might return and "lay them before our members." The resolutions I have given were laid before and agreed to by their members six months before the meeting of delegates at Sheffield, you will thus see that is quite a mistake, inasmuch as the report of the conference itself shows (and any number of witnesses can be found to state it), that they took a very active part in the proceedings of the conference.

11,321. (*Earl of Lichfield.*) Mr. Hobson says that he is the secretary of the Associated Ironworkers of Great Britain, and you say that you are the president of the National Association of Ironworkers. I forget the difference between the two associations?—The difference between the two is this: that one sprang out of the strike in South Staffordshire in 1863, namely the one that Mr. Hobson is connected with. The one that I am connected with commenced in August 1862 in the north of England.

11,322. (*Mr. Mathews.*) In describing yourself as the President of the Ironworkers of Great Britain do you embrace the whole of South Staffordshire?—We embrace nearly the whole of South Staffordshire now. I wish you to understand that our object from the very first was to have one association with the view of preventing complications.

11,323. Do you mean to represent to the Commission that you are now sole representative of the South Staffordshire ironworkers?—No, I do not wish that to be understood.

11,324. So that in giving your evidence as to the existing condition and proceedings of these unions in South Staffordshire you do not speak as to the whole; not as to the Brierley Hill section at all?—I am speaking of this evidence given by Mr. Hobson, and I say that if it is to go forth in the manner in which it is given it is placing the matter in a false form.

11,325. Supposing Mr. Hobson states that which is not quite correct, on the other hand, would not Mr. Hobson have a right to assert that you were not the representative of the whole of the ironworkers in South Staffordshire?—This is not a question of the representation of the whole of the ironworkers. This is purely a question of the line of policy adopted at a certain conference; that is all I think it will be necessary for me to take notice of, so far as Mr. Hobson's statement is concerned. In Mr. Jones's evidence at page 18, the last paragraph, it is stated that "the "union has tended to separate employers and em- "ployed and to destroy the individuality of the work- "man. In case of strikes, individual workmen, and, "in many instances, whole bodies of men have been "prohibited from speaking to their employers or "agents." I can simply state that I am not acquainted with any instance where that has been done. Mr. Jones refers to one case; that is in North Staffordshire, but he being the representative of the northern section of the ironmasters, I apprehend that it would be more germane to the matter if the reference had alluded to that particular part that he is secretary of. At page 19 and at the third paragraph "In the matter of wages," says Mr. Jones, "The principle "adopted has been to take the highest rate paid in "any place in any department, and to make this "the country price without reference to the special "circumstances, which may render an exceptional "payment in certain places only reasonable." I wish the Commissioners to observe that this is a general statement and can only be accepted as such. It would have been better if Mr. Jones had given particular instances, because the policy adopted by the employers in the north of England has been to reduce prices down to one uniform rate, and that is the policy that is adopted by the employers now in the north, quite irrespective of the character of the mills, whereas our policy was to secure certain prices, always taking into account the peculiar position of the mills themselves, inasmuch as some mills are better adapted for bringing out work than others. Lower down Mr. Jones states that the rules contain the following, "That no member "of this association shall be allowed to render any "assistance to non-unionists; neither shall any mem- "ber send for, or by any means procure a situation "for any such obnoxious workmen." This is given as a rule of our association. Now we have no such rule nor ever had a rule like it. But of course, the masters do not take the same interest in other masters that are not members of their association, I apprehend that it cannot be brought as any serious charge against us if we take more interest in our members than we do in those who are not members. Then he states "The policy of the union has been on the "whole detrimental to the interests of the iron- "workers." The men do not appear to be of that opinion, inasmuch as they are endeavouring to the utmost of their ability to reorganize themselves, and are making rapid progress. I suppose there may be two opinions about the matter, inasmuch as there are two unions, and the stronger union of course has done much to render the position of the workmen much worse, as I think, than what it formerly was. At page 20, in the first paragraph, Mr. Jones states: "The ironworkers are said to have sent representatives from several lodges to Belgium." Now of what value, I should like to know, is this statement, "are said?" On what authority, I should like to know, does Mr. Jones make the statement? There certainly never was any deputation sent by us nor any authority given to any body of men to go to Belgium. Then under the head of "Effect on the rate of wages," he says, "The ironworkers union "does not appear to take any prominent part in "transferring labour from one district to another." That is also incorrect, inasmuch as both to accommodate employers, and frequently when men have been out, large bodies have been removed from one district to another. It was so in the Leeds dispute, and it has been so when trade has been good, and masters have frequently applied to the general office for men. Then Mr. Jones states under the head of "Strikes and lockouts": "The Staffordshire men established a "union, and took great care to make the organization "as complete as possible. They then decided to "make a movement for the advance of wages." Now that is as incorrect as anything possibly can be; it is simply putting the cart before the horse. The ironworkers of Staffordshire came out on strike in 1863, and they had no union at the time, and they having appealed to the men of the north they sent a deputation to Staffordshire, by their advice and help a branch of the union was established in South Staffordshire during the time that the men were out on strike. Mr. Jones states in the end of the same paragraph: "The men having succeeded in their demands, "being aided mainly by the unexpected improve- "ment in the demand for iron, attributed their "success solely to the operation of the union, and "at once set themselves to consolidate and extend "the organization, until they made it a national "union." Now that is also incorrect. Our object

Mr. J. Kane.
10 March 1868.

has been to make it a national one, but we have not succeeded up to to-day in consequence of the Brierley Hill and West Bromwich councils loving place and power more than union principles and strength. Mr. Jones says, "Not many months "after the termination of the Staffordshire strike "the union made some objectionable demand in "connexion with one of the firms in the Leeds "district. The men also insisted that all the hands "employed should belong to the union." No one is better informed on this matter than Mr. Jones, and he is well aware that during that period of time when the Leeds affair happened it was only one lodge or one work. I refer now to Mr. Whittem's work, where this policy was adopted against a person of the name of Willoughby Booth, and they were severely censured by the whole association, and a request made to the employers to withdraw the document, which was refused by the employers, who continued their resistance to the request of the union for six months. In fact this demand of the men was made without the knowledge of the union at all. The Leeds men were standing by themselves at the time, and the chief cause of that strike continuing so long was the demand on the part of the employers that they should sign the document which must ever remain repugnant to those who love liberty and respect themselves. Again, Mr. Jones states: "In the north of England the union "authorities proposed to break off their connection "with Staffordshire, provided the masters would also "sever their connection with the masters of other "districts, and would reopen their works. Several "conferences between the masters and delegates from "the men were held, the final one being held on "27th March 1866." Now what I wish to observe is this. You will find the master's words in the second and third paragraph of the 22d page: "And "we further pledge ourselves to sever all communi-"cations between our union and those of North and "South Staffordshire." Those are the words of the masters at the Darlington meeting. They had taken our resolution away, and they attached those words which I have just read to our resolution, so that in reality it was the masters' words and not the men's, which never would have been signed but for treacherous conduct of the Brierley Hill executive, and the starvation in many parts of the north. In referring to the dispute in the north in 1866, Mr. Jones states: "The iron manufacturers also gave notice to reduce "the wages in forges and rolling mills. These notices "expired on 14th July." And he says, "The works "were closed, as the men, acting on the instructions "of their leaders, declined to accept the reduction." Now I should feel very much obliged to this Commission if they would be able through Mr. Jones to secure the evidence of that being a fact. In my previous examination I stated, when asked the question about the north of England strike, that the men had all the facts placed before them, and that having considered these facts and instructed the delegates who attended the Glasgow conference to vote against accepting the reduction,—that was the opinion of the voting power of the men, and was carried into practice, and therefore the men did not come out under the influence of any of the leaders. As a further proof of this I may state that propositions were made to the men for one-half of the men to resume work, and they rejected them. That was about the end of the third month of the dispute. Further on, Mr. Jones states: "For many weeks the men, apparently "acting on instructions, rigidly kept away from "their respective works, and held no communica-"tion with the masters." "Apparently acting on instructions;" there is no proof of that; it is simply an assertion. Of course it is not necessary that I should go into Mr. Jones's statement about the London Working Men's Association, excepting to say this. When Mr. Jones refers to the London Working Men's Association suggesting arbitration to the northern ironworkers in one part of his evidence he speaks against the North Staffordshire men for rejecting the arbitration offered by the North Staffordshire masters, and he speaks in favour of the masters of the north of England rejecting arbitration under similar circumstances, when offered by the union as a basis of settlement in 1866. That is very like blowing hot and cold. On page 24, in the third paragraph, he says, "In most of the strikes above referred to "several of the leading union men have not been "taken back to work by their previous employers. "This has frequently arisen from the fact that the "leaders were the last to give in to the masters' "terms, and before they expressed themselves as "ready to work other men had stepped in and filled "their places." Now that may be correct in some instances, but there are several others where we know that it is not correct, and where distinct statements have been made to the men that it was no use for them to apply, and letters have been sent to prevent these men from having situations. A letter was sent by a person of the name of Haywood, one of the managers for Hawkes Crawshay and Sons, to Mr. Barningham, of Darlington, to prevent a person of the name of John Hutton, a shingler, from getting work, and no fault could be found with the man (he is a very steady man, and has been a teetotaller for many years,) excepting this, that he was one of the treasurers of the society. Then I should like to have some explanation of this passage: "There "are no special instances where ironworkers have "resisted the introduction of machinery, except in the "case of some mechanical puddling machines, which "the puddlers declined to work. They have also in "many cases offered the strongest resistance to the "introduction of improved puddling and heating "furnaces, and thus valuable economica inventions "have been rendered practically imperative in the "iron trade." Further on in Mr. Jones's evidence, he refers to a place in Scotland where this took place. Now I know all the circumstances in connection with that affair. At a place called Gartness the chief manager, a gentleman of the name of Hawkshaw, of London, a steel manufacturer, had some furnaces erected under what was called "Wilson's patent," differing widely from the usual plan in the form and mode of working. Instead of the ordinary furnace there was a hopper instead of what is called a fire hole to feed the furnace with coal. This hopper was raised about three feet above the crown of the furnace, from which the sulphur belched forth as if from the mouth of a fiery pit. Fire grates, such as are in general use, forms no part of Mr. Wilson's patent, hence the sulphur escaping, and checking the respiration of the workmen when making their heats, it became almost impossible for the men to continue at the furnace. The men had been working these furnaces when I went down for something like two months; and another reason they objected to work them was this, that they could not bring out more than five heats, no more being paid for the five heats than was paid for the six. This was virtually a deduction of from 2*s.* to 2*s.* 6*d.* a day off the men, they having as much to pay for five heats as they had to pay before for six. That was the reason why the men objected to work the furnace. They did not say to the master, "You shall have no one "else," but they said, "We decline to do it." The company tried it, and it has been tried elsewhere, and been a dead failure. If the men objected to work therefore it was because they declined to try experiments to their own injury.

11,326. (*Mr. Mathews.*) Do you mean to say that the workmen never offer any objection to the introduction of machinery that is to economize the making of iron?—No such case has ever come under my observation.

11,327. But still cases may come under the observation of other people?—There is only one case given here by Mr. Jones. If he had given more I should probably have been acquainted with them. Then there is this statement made by Mr. Jones on page 26 in the first paragraph. "The men at East

" Jarrow, who had been sent to prison for neglect of " work, were allowed 2*l.* per man as compensation ;" that is to say, allowed 2*l.* per man by the union. Now, I wish the Commission to understand that the men of East Jarrow did not neglect their work. They were asked to work without fettling or coating to the furnaces, and any one having practical knowledge of these matters will be well aware that it is not an uncommon thing for the men to be fined in case they burn either the bridge plates or the bottom plates of the furnace. Mr. Elliott was in the habit of inflicting fines on the ground that the burning of these plates was the result of carelessness. The men therefore when they were short of fettling refused to charge again unless fettling was brought to them, or a guarantee given that they should not be fined, which was refused. They were refused this fettling and told that they must work without it, and they refused to do so. They were taken before the magistrates of Shields, and were sent to Durham gaol for a month. That is the state of the circumstances in connexion with the case, making it very different indeed from the way it is represented by Mr. Jones. Then, he says, that these things show "That the operation of the union is to take the " settlement of disputes out of the hands of the " individual workmen affected, and to place such " matters under the management of the central " authority." I may simply state in reply, that this is the object of the masters union as well, according to the rules which Mr. Jones himself quotes. Then he states that " the itinerant work of the president " shows that the union is only supported in large " measure under compulsion." Neither Mr. Jones nor any other person will be able to furnish evidence except of a questionable character that there has been anything like compulsion exercised by me on any occasion ; and it is a gratuitous assertion which a person who is careful of speaking the truth will not make. Under the head of "Ironmasters' Association," in nearly the first paragraph, Mr. Jones says, "The men were to adopt such modifications in " their rules as would make them conform to the " spirit of the resolutions they had passed with " reference to the separation from other districts. " The objects of the manufacturers' association are " the following." Now this refers to a meeting that was held at Darlington. The men never have pledged themselves to do anything of the kind. A correspondence passed between Mr. Hopkins and the previous secretary, Mr. Gill, with our office, and a self-appointed deputation belonging to the Middlesbro works waited upon Mr. Hopkins about the alteration of some of the rules, but nothing was definitely come to, inasmuch as it was not in the power of two lodges to do anything of the kind, and the members strongly objected to that power being exercised by the employers over their association. In reply to a statement which I gave previously about the average price paid to puddlers, Mr. Jones read a letter from Mr. Hopkins, and it turns out on reading this letter carefully over that there are only some 24 or 28 puddlers that are referred to in it. And therefore I take it that that letter did not at all invalidate the statement which I gave. And if Mr. Jones had given the fact of the men having to pay two turns out of one at the commencement of the work, and the frequent occurrence also of the men only getting five heats instead of six, that would have materially altered the value of the figures ; besides this plea put in by Mr. Jones can only be taken as the exception, not the rule. There is another statement that was made about the selling price of iron, and the trade in the north not being regulated in the same way that the Staffordshire trade is. During the 30 years of my experience as a workman I know that my wages were invariably regulated by the current prices as managed in South Staffordshire, and that any alteration either in the way of improvement, that is to say, in the shape of an advance or in the shape of a reduction necessarily followed the South Staffordshire meetings, and that continued up to 1866, when instead of South Staffordshire taking the lead, as it had invariably done before, a notice for reduction was given by the masters in the north of England, so that the statement of Mr. Jones in that respect is exceedingly novel, as well as incorrect. I do not know that there is anything more for me to refer to, excepting the statement which Mr. Jones has given before the Commission relative to the men having 11 local secretaries that were publicans. I do not know that there is anything serious about this charge, but it is simply untrue. At no period of the union history has there been anything of the kind.

11,328. (*Mr. Mathews.*) Is it the custom for the men to meet at public-houses?—Yes, it is unfortunately so.

11,329. And when they meet in public-houses do they generally meet at the houses of the officers of the union who happen to keep public-houses?—It is very seldom that any of the officers of the union do keep public-houses, and where it does happen it would probably be the treasurer, not the secretary.

11,330. Still he would be an officer of the union?—Yes ; but I do not say that the treasurers are frequently publicans. There have been cases where that has occurred, and I am not acquainted with more than one case where the secretary was a publican, and that was for only a very short period of time.

11,331. When you speak within your knowledge do you speak of the north of England or Staffordshire?—I speak of the north of England and a portion of Staffordshire. There is only one secretary in Staffordshire that keeps a public-house, and he has not been in it long ; that is Chambers at Bilston.

11,332. (*Mr. Jones.*) I may explain that that was not my own statement. It was simply an abstract derived from the journal published by the union ; the addresses are given at the end of the union report.

11,333. (*Mr. Kane.*) Then it would appear that the fact is this, that Mr. Jones in his indiscreet haste has committed himself. The place of meeting is given because it is the address where the letters are sent to, not because the keeper of that house is the secretary.

11,334. (*Chairman.*) Why should he like to have his letters left at the public-house instead of his own house?—Because it is the place of meeting.

11,335. And the letters would relate to the business of the meeting?—Yes. I have only another matter to refer to, and it is relative to the Scotch letter that was introduced, which was asked for before. I have sought for that letter ; a copy of it I never had, excepting the one that I sent myself to the " Glasgow Sentinel." Of course we were in the habit of getting these papers at that time. There were some slips struck off and supplied to the various lodges, and the next time I saw printed copies was when I accompanied several delegates to Mr. Bell's office at Newcastle, which the masters had got struck off. I have endeavoured to secure a copy of that letter and failed. The extract put in by Mr. Jones is correct, but the inference is incorrect. The words about our acting in connexion with South Staffordshire, in calling our men out were simply a diplomatic phrase. We were against the calling out of the men from the first. Mr. Hobson and I had correspondence on the subject. In addition the Sheffield resolution was against it, but having 450 men in that district we were anxious to keep these men as members, and the men refusing to work so long as the men in the Tunstall district were working, the consequence was that we were obliged to take these men on our hands until we saw whether it was possible to get the South Staffordshire party to agree with us in ordering the men to go to work ; that was the policy which we adopted on that occasion.

The witness withdrew.

COMMISSION.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our right trusty and well-beloved Councillor Sir William Erle, Knight; Our right trusty and right well-beloved Cousin Thomas George Earl of Lichfield; Our trusty and well-beloved Francis Charteris, Esquire (commonly called Lord Elcho); Our right trusty and well-beloved Councillor Sir Edmund Walker Head, Baronet, Knight Commander of Our most Honourable Order of the Bath; Our trusty and well-beloved Sir Daniel Gooch, Baronet; Our trusty and well-beloved Herman Merivale, Esquire, Companion of Our most Honourable Order of the Bath; Our trusty and well-beloved James Booth, Esquire, Companion of Our most Honourable Order of the Bath; Our trusty and well-beloved John Arthur Roebuck, Esquire, one of Our Counsel learned in the Law; Our trusty and well-beloved Thomas Hughes, Esquire, and Frederic Harrison, Esquire, Barristers at Law; and Our trusty and well-beloved William Mathews, Esquire, greeting.

Whereas it has been represented unto Us that it is expedient that inquiry should be made into the several matters herein-after mentioned.

Now Know Ye, that We, reposing great trust and confidence in your ability and discretion, have nominated, constituted, and appointed, and do by these Presents nominate, constitute, and appoint, you, the said Sir William Erle, Thomas George Earl of Lichfield, Francis Charteris, Esquire (commonly called Lord Elcho), Sir Edmund Walker Head, Sir Daniel Gooch, Herman Merivale, James Booth, John Arthur Roebuck, Thomas Hughes, Frederic Harrison, and William Mathews, to be Our Commissioners for the purposes of the said inquiry.

And We do hereby enjoin you, or any Four of you, to inquire into and report on the Organization and Rules of Trades Unions and other Associations, whether of Workmen or Employers, and to inquire into and report on the effect produced by such Trades Unions and Associations on the Workmen and Employers respectively, and on the Relations between Workmen and Employers, and on the Trade and Industry of the Country; with power to investigate any recent acts of intimidation, outrage, or wrong alleged to have been promoted, encouraged, or connived at by such Trades Unions or other Associations, and also to suggest any improvements to be made in the law with respect to the matters aforesaid, or with respect to the relations between Workmen and their Employers, for the mutual benefit of both parties.

And for the better discovery of the truth in the premises, We do by these Presents give and grant unto you, or any Four of you, full power and authority to call before you, or any Four of you, such persons as you shall judge necessary, by whom you may be better informed of the truth in the premises, and to inquire of the premises and every part thereof by all other lawful ways and means whatsoever.

And Our further Will and Pleasure is that you, Our said Commissioners, do, with as little delay as may be consistent with a due discharge of the duties hereby imposed upon you, certify unto Us from time to time, under your hands and seals, your several proceedings in the premises.

And We do further will and command, and by these Presents ordain, that this Our Commission shall continue in full force and virtue, and that you, our said Commissioners, or any Four of you, shall and may from time to time proceed in the execution thereof, and of every matter or thing therein contained, although the same be not continued from time to time by adjournment.

And for your assistance in the execution of these Presents We do hereby authorize and empower you to appoint a Secretary to this Our Commission, to attend you, whose services and assistance We require you to use from time to time as occasion may require.

Given at Our Court at St. James, the Twelfth day of February 1867, in the Thirtieth Year of Our Reign.

By Her Majesty's Command.

S. H. WALPOLE.

SIXTH REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners appointed to inquire into and report on the Organization and Rules of Trades Unions and other Associations, whether of Workmen or Employers, and to inquire into and report on the effects produced by such Trades Unions and Associations on the Workmen and Employers respectively, and on the Relations between Workmen and Employers, and on the Trade and Industry of the Country; with power to investigate any recent acts of intimidation, outrage, or wrong alleged to have been promoted, encouraged, or connived at by such Trades Unions or other Associations, and also to suggest any improvements to be made in the law with respect to the matters aforesaid, or with respect to the relations between Workmen and their Employers, for the mutual benefit of both parties, have held several meetings, and humbly beg leave to submit to Your Majesty evidence given before us at our meetings held upon the 10th, 17th, 24th, 25th, and 31st days of March 1868.

(Signed) W. ERLE, Chairman.
LICHFIELD.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

APPOINTED TO INQUIRE INTO

TRADES UNIONS AND OTHER ASSOCIATIONS.

ARMY CLUB
PALL MALL

1, Park Prospect, Westminster, Tuesday, 10th March 1868.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.
The Right Hon. the EARL of LICHFIELD.
Lord ELCHO, M.P.
Sir DANIEL GOOCH, Bart., M.P.
HERMAN MERIVALE, Esq., C.B.
JAMES BOOTH, Esq., C.B.
JOHN ARTHUR ROEBUCK, Esq., M.P.
FREDERIC HARRISON, Esq.
WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. G. Elliot.

10 March 1868.

Mr. GEORGE ELLIOT examined.

11,336. (*Chairman.*) You are a coalowner, I believe ?—I am.

11,337. What are your principal coalworks now ?—I have a great many ; the largest that I have are in Durham and Northumberland, the next are the Dyffryn collieries in the Aberdare district in Glamorganshire, and I have some in North Wales at Mostyn and in North and South Staffordshire.

11,338. About how many men do you employ in the different works ?—More than 10,000.

11,339. (*Mr. Mathews.*) I think that you have been engaged in the coal trade from a boy, have you not ?—Yes, a very young boy.

11,340. And you have gradually progressed from your initiative as a boy to being about the largest coal master in England ?—I went down the pit at a very early age, nine years of age, and I did the ordinary work of a collier at Penshaw in the county of Durham till I was 19 or 20, and after that I became a deputy, an overman, a colliery viewer, and so on, and since then I have become a coalowner. The number of persons employed by me I have already mentioned. The quantity of coal raised out of pits belonging to myself and friends and under my management is more than two millions annually.

11,341. In fact you have gone through every department ?—I think so, I have worked with my own hands at every description of work as a collier.

11,342. Therefore you have had a very considerable amount of experience, not only in the working of collieries, but in the management of large masses of men ?—Yes ; and very successful I have been in the management of men ; there has been a great deal of good temper on both sides, and I stand very well with them, I believe.

11,343. Has your experience enabled you to obtain accurate and extensive information as to the habits of colliers, as to their views which they entertain with regard to their occupation, and as to the nature of the various combinations between them ?—Yes, my experience has been very large of course.

11,344. In the course of this experience have you had much to do with the men in their connexion with unions ?—I may say that we have had some very large strikes, but they have not been frequent. For example, in 1831, there was a very large strike in Durham and Northumberland. I suppose not less than 30,000 people were out of emplyment at that time, (I was, of course, young then,) and the object of that strike was to shorten the hours of labour.

11,345. (*Lord Elcho.*) Forgive my asking you, were you yourself then a workman ?—Yes ; I was working the long hours at that time, and I was one of those who were much interested in the issue of that great contest. We used to work 16 hours a day, that was reduced to 14, but the great strike of 1831 was to reduce the hours of labor from 14 to 12 hours. It continued for many weeks and caused great privation and suffering. It was ultimately a success on the part of the workmen, and the hours of labour were reduced to 12.

11,346. (*Mr. Roebuck*). Was that strike under the conduct of the trades unions people ?—No ; we had not what you may call the organization of a trades union. We had a very able, clever man, called Tommy Hepburn, as our leader (we always had plenty of clever men to lead us), and it was under his powerful and able guidance that the whole of those two counties acted and succeeded in obtaining their object. It was a very great blessing to all the men, and no injury to the coal owners that the hours should be so reduced. Then in 1832, the year after, they thought they would have something more, and they had another strike. That strike was for a considerable advance in wages. That was resisted strongly and the men failed.

11,347. Did your great man aid you in that strike ? He did, but it had not his entire support ; he did not approve of it, but he was identified with it. As I have said, that failed, and it was not a long strike. Then we had peace till 1844, when we had a great strike, which lasted in both those counties for 20 weeks.

11,348. For what was that strike ?—It began out of a very simple thing. It was in reference to the introduction of wire ropes, the men refused to go down the pits upon wire ropes. When there is a disposition to strike, a very small thing leads up to it, and their grievance in this case was against the wire rope, and they refused to go to work, and they struck. I should mention that in that country, Durham and Northumberland, the men had from time immemorial been always

Mr. G. Elliot.
10 March 1868.

hired for 12 months. These men, in spite of their written agreement refused to go down the pit on account of these wire ropes having been put on. Then the masters thought, that inasmuch as the men were striking in spite of their written agreement, when the month of April, the time when people were hired, came round, they would not hire them again for 12 months, but that they would change the term and would not give them more than the period of one month, so that they should be servants from month to month, subject to notice. That was not a question of wages, therefore, but a question of the mode and form of hiring. The men stood out for 20 weeks in order that they might have their old form of agreement for 12 months, but we ultimately failed in that, and the monthly agreement was substituted for the yearly, and went on for several years. That was the strike of 1844. With regard to that monthly agreement, I may mention that on comparing it with the old agreement, I was so impressed with the error that the coal owners had made, that when I was the manager of the late Marchioness of Londonderry's affairs in 1853 and 1854 I strongly urged her to allow me to restore the yearly hiring, and I succeeded in restoring it. I believe that if we had gone on the monthly hiring one or two years more we should never have got them back. The yearly hiring is a great benefit to the workman and a greater comfort to the owner, and I believe that we have all been much more orderly and comfortable under that system than we were when we had that change to the monthly hiring.

11,349. (*Sir D. Gooch.*) Are you bound by that yearly hiring to keep them fully employed?—There is a minimum: for example, we say, "We will find "from the 5th of April to the 5th of April a cer- "tain amount of work, such an amount as shall be "equal to 36*s.* or 33*s.* as the case may be per fort- "night, and failing to give you so much work we will "pay you those wages." I have had that to do in the present year, that is to say, I have not had work, but I have the paid the men, and they are content we find with the system. In that country, every man has his house, his firing, and his garden free of charge, which is a great boon. It makes them very contented, and better off, I believe, than pitmen in any other part of the kingdom.

11,350. (*Lord Elcho.*) Does that system of hiring extend to Yorkshire?—No, it does not. There was a great controversy amongst the coalowners there, and several of them did not embrace the opportunity then. In Northumberland, a great many of them have since tried it, but the time has gone by, and the men would not agree to it now. The unionists are very often, in fact every year, trying to impress upon the men that it is a kind of slavery when they bind themselves by the year, and I have been afraid, very frequently, that they may yield, because it takes away, no doubt, an element of discontent during the whole year. They make their own bargain, and fight hard enough in making it at the time, it is true, but it gets rid of the oscillation of prices and changes, and so on, and you can better make contracts for delivering coals.

11,351. (*Mr. Roebuck.*) The yearly hiring does away with the power of the union organization as I understand you?—It does so to a great extent, excepting at the time when the contract has to be made; the union operates then, and it operates very strongly. The men combine amongst themselves, but I am bound to say that the union is not a universal thing with us, though it crops up occasionally about the binding time. I do not think that a regular system of unionism prevails at any of my collieries, excepting societies for self support in sickness and so on.

11,352. (*Sir D. Gooch.*) That you encourage as much as you can?—We do, and assist the men in it.

11,353. (*Mr. Roebuck.*) Have you been at all interfered with by the unions?—I will mention what has happened recently, in this present year 1868, only a month ago, at some large works of ours down in Wales. The trade there is very bad, it has been very unprofitable, arising from a variety of causes.

11,354. (*Lord Elcho.*) You are now in 1868. Is there anything to tell us which has occurred between the years 1844 and 1868?—I have had no general strike since 1844, in fact there has been no general strike since 1844.

11,355. (*Mr. Mathews.*) You are speaking of the North of England. In other collieries in England you have had strikes; I presume in North Staffordshire for instance?—We have not had a strike in North Staffordshire lasting more than a week, and that I do not call a strike.

11,356. Had you a long strike in 1861?—No.

11,357. Your neighbours had?—You had I know; I like to try to avoid a strike if possible, and a great deal may be done in that way. The case which I am about to state is very interesting, I am now going to speak of the Welsh people. Of course my experience of them, and their confidence in me, is not the same as in the case of those people I have lived amongst and known so long. There was a general suggestion, in fact a movement that there should be a reduction of wages in Wales. I was rather reluctant to do it, for during this last year the price of bread has been very high, in fact very nearly double what it was when I went into Wales.

11,358. (*Lord Elcho.*) Have you monthly hiring in Wales?—Yes. However the urgency of the case was such that it was necessary to give them notice. I went and consulted a neighbour and friend of mine there, Mr. Bruce Price, a very good man, and known very well among the people. I saw also Dr. Price, who is a great preacher and a very clever man, and has enormous influence amongst the people there, and told him what was inevitable. They both recommended me to take a different course from that which had been generally taken. The usual way there has always been to placard a notice, and soon there is an end of it. I did not want to take off the 15 per cent. What I wanted to do was to alter the mode of working. The system of getting the coal there is very expensive, and that arises from that which is really of no advantage to the men, which involves a great outlay to the owner and adds very much to the work of the miner himself. And you will see that in a moment from an explanation of it. We work there in a face of 12 yards, we have only a man and a boy employed in it, and the boy is very often not more than 10 or 12 years of age. A place with a 12 yards face does not yield more than an average of 4 tons a day. Into that place we have to make a horse road and it has to be supported with timber. There is an enormous expense therefore connected with the getting of the coal, and we have in all those pits three times more open face than we have in any other colliery that I have got. I am now referring to the system practised in South Wales in the Aberdare district.

11,359. (*Sir D. Gooch.*) I suppose it is the long wall work?—Yes, the long wall work.

11,360. (*Mr. Mathews.*) Has not Mr. Nixon suggested a plan to meet that?—This same subject bears upon what Mr. Nixon has tried to provide a remedy for by working double shifts. I do not think that he has had so much experience with pitmen as I have. I have told him that he cannot succeed and I do not think that it would be desirable for him to succeed if he could. His plan is that instead of one man and a boy working there 10, 11, and 12 hours as they do, they should work 8 hours, and that there should be a relay, two to follow two. In the first place that interferes altogether with the habits of the people. They would have to get up at 4 o'clock in the morning to go to work, they now get up at six and half-past. They would also work a shorter time, and it would so interfere I think with all the habits and the domestic arrangements of the houses, that I believe that there would be a greater difficulty to enforce it with the women and with the other people than there would be with the workmen themselves. So that considering the subject well, I thought it was better to say this. "Will you instead of two work "three men in a place. In the North of England I

"have got six men working on the same area, in every "other colliery I am getting six men to work on the "same area, but if you will only work three, I will "give you back 10 per cent. of the 15 per cent. reduc- "tion to be made. If you will go and work four I will "give you back the whole of your 15 per cent. And "the reason is that I can afford to do it; it will pay me "even if I gave you back the 15 per cent, if you will "only do it." I have been working at that for months. I took my friend's advice. I have seen the men and talked it over with them. I have been at their houses and had them to see me, and spent days in discussing it. We so far succeeded that I had more than 200 of them who actually began to do it and began before the reduction, and were doing it without the payment of the 15 per cent. I had a deputation from every pit and discussed it with them, and every one of them agreed and said that they would much rather do it and save the reduction. They began and they worked on the new plan, and then there was a great meeting and the men came over to it from Monmouthshire and other places. I was there, and I suppose that 12,000 or 14,000 people were there. And these men came home and told me that there was a resolution passed at the meeting that they were not to alter the custom and therefore they were afraid to do it, as it was against the general voice of the district, I said, "Well, "I cannot help it, you must go and have your 15 per "cent. reduction." There is an extraordinary instance of men willing and disposed to make the change, who are now going on receiving 15 per cent. less than they had before. They will not adopt the mode of working which I suggest to them with the offer that they shall have 15 per cent. as an equivalent.

11,361. Are you not working stall work in any of your pits?—In some of them. The stalls are 12 feet wide; there they work with a boy too.

11,362. (*Mr. Roebuck.*) How was this resolution obtained?—They were six hours at it; it was the resolution of a large meeting.

11,363. (*Mr. Harrison.*) It was a resolution not passed by a union but by a large meeting?—All the meeting. I do not think they have any union excepting the spontaneous combination which arises if there is the least interference with them.

11,364. (*Mr. Mathews.*) There are no organized unions I think in South Wales?—I think not.

11,365. (*Chairman.*) I cannot make out that the Welshmen were well advised in adhering to the old plan, they had a little more elbow room I suppose?—Yes.

11,366. What is the value of that elbow room under the ground?—As to the value of the elbow room, in other portions of the country there is no additional price paid in consideration of it.

11,367. Can you understand why people selling their labour should sell it at 15 per cent. less than they might get for it. Who sways them?—They were swayed by this great meeting.

11,368. But the great meeting was composed of atoms; there is always a wire-puller behind?—That is so. However, you have the fact.

11,369. (*Mr. Harrison.*) Some other consideration than that of money came in, probably it was a question of habit?—In the first place, I am not aware that these people have been well used, they seem extremely jealous, and they are apprehensive that there is always some liberty going to be taken with them whatever the proposed change may be.

11,370. (*Chairman.*) In Cornwall we always found that it was no use on earth for any Saxon to try and manage anything with the Cornish men, but if you had a Cornish man on your side it was easily done. Did you try a Welshman in this case?—They were all Welshmen that I had before me; we were three or four hours talking about it, and then meeting after meeting came to an unanimous conclusion that they would adopt my suggestion rather than have what they call the drop, and they were quite ready and pleased with it, because it was very much for their advantage. But when they had this general meeting they passed a resolution that they were to take the 15 per cent., but there was to be no interference with the mode of working. That is the most unaccountable part of the thing; I may say that in this particular district the coal is easier to get than any coal I know of.

11,371. (*Chairman.*) It is worked on the level, is it not?—Yes, and it is easier to work than any coal that I have anywhere else; but it costs more to get than any coal, and I think the people are worse off there than at any other of the places which I have.

11,372. (*Lord Elcho.*) It was simply a conservative movement on the part of the Welsh miners?—Yes.

11,373. And they sacrificed 15 per cent. for the sake of it?—Yes.

11,374. (*Mr. Roebuck.*) It is simply the result of ignorance I suppose?—Yes; I think so. There was no bad feeling about it.

11,375. (*Mr. Mathews.*) Do you find from your experience with Welshmen that they are more difficult to be controlled than Englishmen?—I believe a Welshman is a more squeezable, long suffering creature than an Englishman is, and he stands on his defence with some want of power which seems to belong to the race; he does not stand up with the amount of firmness and fight in him that an Englishman does.

11,376. (*Mr. Merivale.*) He has not had so much of unionism?—They have had great combinations; they are very clannish if a man departs from what they have agreed to; if he is called a turncoat, (the greatest penalty you can inflict upon him,) he is hooted and hunted down; they have what is called a hunting. They make a fellow run and hunt him down like a dog.

11,377. (*Mr. Booth.*) At this large meeting which you spoke of, what was the cry or the watchword, was it against innovation?—Yes; it amounted to this: We cannot help a reduction, but we will not have any change in our system.

11,378. (*Mr. Harrison.*) In point of fact you find in this Welsh district where there is no organised system of unionism, most of the practices which are laid to the charge of unionism, that is to say, you have unreasonable interference with the proposed mode of working of the employers, you have a certain persecution practised against obnoxious members, and you have a majority exercising influence over a minority just the same as if it were an organized union. It is not reduced precisely to the same system, and it is not under the same control, but you have the same thing. In point of fact it is a matter which arises where bodies of men work together?—Yes.

11,379. (*Mr. Roebuck.*) It is an unorganized union and inflicts pretty nearly the same mischief?—I happened to be there when the thing was going on. I thought it better to be on the spot, and what they did was this—they sent a bellman round the whole Aberdare Valley on the Sunday evening convening a public meeting announcing that the pits were all to lie off the next day, and every pit in the valley was off.

11,380. (*Chairman.*) Who sent the bellman round?—I do not know that, but that is their mode of convening a meeting, and a very successful one it is, for they were all off.

11,381. We have heard that in many of the Welsh districts the minister might order a whole community out; I do not know whether the minister appeared in any of these questions?—I do not believe in that, that is not my experience.

11,382. (*Mr. Harrison.*) In the northern districts in which you have collieries as well, there exist something like regular unions in portions of the districts, do there not?—It is not quite so, but they can get a union up in a very short space of time, for instance, if the binding comes round.

11,383. I mean any regular association that exists from year to year, any permanent society that exists on a large scale?—They have had more trouble in that way in Northumberland; the people in Northumberland are not bound by the year, and they are constantly disputing about wages, or at any rate very

M. G. Elliot.
10 March 1868.

frequently, and there has been a combination on the part of the owners as well as on the part of the men, and they have been resisting one another; the owners contributing to collieries out of work, and the men supporting their fellowmen against the owners; but the owners in all these cases have generally been too strong for the men.

11,384. (*Sir D. Gooch.*) The benefit societies are compulsory upon the men, are they not—that is to say, each man subscribes so much to schools and so much to a medical fund?—Yes, and I think that there is too much deducted for those objects.

11,385. (*Mr. Harrison.*) You have no experience of the South Yorkshire district, have you, having no colliery in Yorkshire?—I know the Oaks colliery district pretty well. I have to go there just now.

11,386. That comes within the district of the South Yorkshire Colliery Association?—Yes.

11,387. (*Mr. Mathews.*) You cannot speak very much of the organization of unions in South Yorkshire?—No.

11,388. You think we had better in reference to that get evidence from other sources?—Yes; I think so; I can speak with tolerable authority as to Durham and Northumberland, and South Wales and North Wales, and North Staffordshire.

11,389. (*Sir D. Gooch.*) With regard to the long wall work in North Wales, you are not limited there to a man and a boy, are you?—No, it is a habit that these people have got into, there they get the boys, and the coal is easy to work. They are not their own boys, but they empty the workhouses around so as to get boys to work with them. They enter into an engagement that the boy is to be attended to, and so on, and they take them and work with them in that way, this boy reckons as a man with them, and his work is so good and his price is so easy that he can work something like two turns, and that man and that boy get as much as two men do.

11,390. Is it the practice in your colliery in South Wales, as it is in some collieries, that the men limit the quantity that each man sends to bank?—No.

11,391. It is so down the Rhonda valley?—Yes; the Rhonda valley has been much more insubordinate I think than our district.

11,392. (*Lord Elcho.*) To what do you attribute the difference?—It is more recently opened out, and the men have not got located.

11,393. Customs have not grown up you mean?—Yes; you generally get at the new places a loose stray class of working people until you get more of them and then select them.

11,394. (*Mr. Harrison.*) What are the hours which the men work as a rule in your collieries, in Wales?—They work long hours, and that is one of the reasons why the double shift would not answer, because the nature of the work there is not like the hard laborious exhaustive work that the north-country people have. The coal is very easy to get, and their work consists more in loading the coal which requires time; they build it up on the trams almost like building a dry wall, and that requires time; and to oblige them to do the same work in a shorter space of time I do not think possible.

11,395. What is the average length of work?—From 10 to 12 hours.

11,396. And what is the average in the northern districts?—They will not average seven.

11,397. (*Sir D. Gooch.*) Do I rightly understand you, that formerly the men were actually underground 16 hours in the north?—Yes; at the time of the strike in the north I have worked 16 hours myself underground.

11,398. (*Mr. Harrison.*) Comparing the wages paid in Wales and the north, do they differ much taking the average get of the same class of men?—The price we pay for getting our coals in South Wales, in Aberdare, is very much higher than what we should pay for the same work if we were doing it in Durham or in Northumberland.

11,399. (*Sir D. Gooch.*) The price per ton you mean is more?—Yes; it is at least 25 per cent. more; but you must take into consideration this, that in Northumberland and Durham we find every man his house, his firing, and garden and everything of that sort, whereas in South Wales it costs them 4*s.* a week to find those things.

11,400 (*Mr. Roebuck.*) Is the Welsh coal dearer to the consumer than the Durham coal?—The steam coal is just about the same price and I am inclined to think it is better, though my interest in the north is larger.

11,401. Though the wages have been different the price of coal has been the same?—The selling price. That arises in this way: we had the Welsh coals at a high price about 12 or 18 months ago much higher than the Durham price, but the large quantity of coal now thrown into our markets from the bad state of the iron trade, has brought down the price about 2*s.* 6*d.* a ton.

11,402. (*Mr. Mathews.*) What particular works are you alluding to that have thrown coal on the market?—The Dowlais works, the Cyfartha works, the Plymouth works, the Rhymney works, in fact all the large works.

11,403. All those large works have thrown coal, formerly consumed in making iron, upon the general market, and hence the reduction in the value of it by reason of the excessive quantity in the market?—Yes.

11,404. Have you any idea what quantity the Dowlais works are throwing on the market?—I do not know now. Mr. Clark, when I was talking to him on the subject, said he would have to withdraw about 1,500 tons a day to throw into the general market.

11,405. (*Mr. Roebuck.*) Have you had much correspondence or communication with the trades unions?—No.

11,406. Therefore you cannot give us much information as to the effect of the trades unions upon the coal workers?—If the description of union which I have just been adverting to does not come under the denomination of trades unions, I cannot.

11,407. (*Mr. Harrison.*) You have not for instance had anything to do with the South Yorkshire Miners Association, or the Lancashire Association, or the Scotch Association; neither of them has come directly under your knowledge?—No.

11,408. (*Mr. Mathews.*) In North Staffordshire have you had much experience of them?—No, we have not been off more than once with strikes since I have had to do with North Staffordshire.

11,409. Many of your men there are in unions, are they not?—I may say they are, but they do not interfere with us. At that North Staffordshire colliery for instance, within the present year we had the men sent for and talked to them and pointed out the state of the trade, and they agreed to a reduction.

11,410. (*Mr. Roebuck.*) Was it through trades unions that you effected that?—No; their leading men met us, we asked them to come and discuss the case, and we said, "Now here is the time when you ought to meet the case," and the men met it.

11,411. (*Mr. Harrison.*) You think that the system of continually changing the wages when the men are out of work, is a bad one for both parties?—I do not think it is a good one. I endeavour to keep the wages as uniform as I can, whether the trade is good or bad. A little of the paternal system is very useful, because you can then keep your men in times of difficulty. I am sure it is better not to be always changing you wages.

11,412. Do you think that the sliding scale in vogue in Staffordshire is a mistake?—I did not know that they had one.

11,413. I refer to the sliding scale in iron. The wages of colliers are ultimately regulated more or less by those of the iron trade, are they not?—I do not think that that has anything to do with it; what your prices are depends upon whether you have got abundance of labour or not.

11,414. (*Mr. Mathews.*) In North Staffordshire was it your own men with whom you had the personal

intercourse, or did they delegate any men from the union?—No, it was just our own people.

11,415. If the leaders of the union had proposed to have anything to do with you, you would have objected I suppose?—I do not know what I should have done under the circumstances; I should very likely have succeeded in showing them that it was unnecessary.

11,416. (*Sir D. Gooch.*) You have not told us the general earnings of colliers in these districts per week?—It depends of course upon the amount of trade you have got.

11,417. Taking the general average of earnings what is the position of these men?—Take Durham for instance, and all the places I have there. Taking the people on the average, they will average 4*s.* 6*d.* to 4*s.* 9*d.* a day all the year round.

11,418. (*Mr. Mathews.*) But have they to find their own candles?—We generally use lamps and there is no deduction for that.

11,419. Do they find their own picks?—Yes.

11,420. Do they find their own beer in the pit?—I never saw any beer drunk in a pit in my life.

11,421. You spoke of colliers in Wales working 10 to 11 hours a day, whilst the colliers in the Northumberland district work not more than seven. Do the wages differ in proportion to the hours?—I think that the Northumberland people do more in seven hours than the Welshmen in the 11.

11,422. Do they get the same wages?—The wages are very much the same. The Welshman gets the same wages, but he has those heavy deductions, so that taking it altogether the North Country people are better off. For example, take the present case: I have the returns of my collieries in South Wales stating that they have many of them not worked more than two or three or four days this last fortnight. Where a man has his rent to pay and coal and so on, that slackness is very distressing; whereas in slack times in other works those things are guaranteed to them. If I am spared a few years I will try to make the pitman in Wales better off than he is, by getting him a cheaper house, and by getting those other comforts which seem to have vanished from him without an equivalent. They are under a disadvantage in ever point of view. The shops there charge a great deal too much.

11,423. (*Mr. Harrison.*) Are women employed at all in any part of the district at the pits mouth in Wales?—In Wales, but no women are employed by me in the North of England. I believe it is very common in many of the places. There are only two women upon the whole of our works, and I have turned them off once or twice, and they have cried to be on again.

11,424. (*Sir D. Gooch.*) They are employed in Lancashire?—Only on the banks.

11,425. (*Mr. Harrison.*) You do not consider it necessary to employ them for efficient work?—No, it is cheaper, and those who advocate it advocate it because it costs less money I believe.

11,426. (*Mr. Roebuck.*) You never found out the influence of the societies upon the employment of women?—I have never had much experience of women being employed in that way.

11,427. (*Mr. Harrison.*) You do not remember the time when women were employed underground, perhaps?—Yes.

11,428. (*Mr. Roebuck.*) Do you think that the habits and ménage and position of the working men have been improved by taking the women from underground?—I do, and I think that they ought not be employed on the pit's bank on that kind of work.

11,429. You do not think that it comes within the sphere of women's work?—I do not; in fact I have disallowed it in all but those two cases. In one case it is a poor girl who keeps her mother.

11,430. (*Mr. Mathews.*) Do you think it a worse occupation than that of women in agricultural pursuits?—I do not know that it is worse; it may be a kind of prejudice in my mind about it, but I would almost as soon see a ghost upon the pit's bank.

11,431. (*Mr. Roebuck.*) Do you know anything about women being employed in the fields?—Our fields in the north of England are cultivated by women.

11,432. That is generally not laborious or painful work, I think, and do not the women like it?—They like it, they generally reap the corn, and do a good deal of work in the north of England and I never knew that it was looked upon as being derogatory until I read some accounts in the papers of what was stated before the Committee, because they are so healthy.

11,433. (*Mr. Mathews.*) Do not the women exhibit the same reluctance to be discharged from their employment on the pit's bank as they would from agricultural employment?—I think more so, because they get better wages.

11,434. In fact it makes them better off?—Yes.

11,435. And if you were to discharge them from the pit's bank it would be a confiscation of those wages?—Yes, and I think the Legislature is right in not prohibiting it, but I think that I am right also in my dislike of it.

11,436. (*Mr. Roebuck.*) Does not the Legislature prohibit the working of women in mines?—Yes, but we are now speaking of working on the surface.

11,437. (*Mr. Booth.*) Would you have any objection to employ on the bank at the pit's mouth women who had no duties at home?—I would not like to do it, I do not know that I can give you very good reasons for not liking it, but I have a great dislike to it.

11,438. You think it is open to abuse?—It is open to abuse and the work is very laborious and very dirty.

11,439. (*Mr. Merivale.*) Is there any limit of age as to boys going underground?—Yes, 12 years of age.

11,440. And working on the bank?—They may be employed on the bank at a younger age. I do not know whether I sufficiently explained myself just now about the point which I referred to about the men's unwillingness to adopt a new system and take that 15 per cent. My great reason for proposing that is that with one-third of the excavation in the mine I could get the same quantity of coal. I should therefore you see have only one-third of the amount of wall face open. I should thereby reduce the necessity and use of ventilation to the extent of one-third, and economy would also be effected by having only one third of the area in the pit to support with timber, and one-third of the number of horse roads. If I could succeed in getting those men to agree to and have confidence in the plan which I propose, I believe that the saving I could effect myself upon that one occasion would be over 40,000*l.* a year.

11,441. (*Sir D. Gooch.*) They gave you no reason I suppose for refusing?—The reason was that they passed a resolution against it.

11,442. Would those three men whom you would put together not be likely to have some difference as to the quantity of coal which they might cut on the same face?—No, we select partners, and we do not ballot them together; it is always a selection; they are always brothers or friends, they work like reapers in a field of corn.

11,443. (*Lord Elcho.*) You have given us the sum by which you would have increased your receipts, and you have told us that the men sacrificed 15 per cent. What was the total yearly sacrifice made thereby?—I should think the sacrifice that they make is more than 20,000*l.* a year; in fact, if men will work in the way that I want them to work, I am willing to give them 20,000*l.* a year more for their labour than they are now receiving.

11,444. Rather than change a custom (it comes to that) they sacrifice that amount?—Yes.

11,445. And that prevents you making 40,000*l.*?—Yes.

11,446. (*Sir D. Gooch.*) How many men will that apply to?—This 15 per cent. only applies you must observe to the coal cutter, it does not apply to the other kinds of labour; I suppose the number is about 4,000.

11,447. (*Mr. Harrison.*) You alluded just now I think to a dispute which Messrs. Straker and Love

M. G. Elliot.
10 March 1868.

had with their men; are you acquainted with the circumstances?—Yes.

11,448. Will you state succinctly the origin of that?—The precise origin I am not perhaps quite clear about, but my impression, which I believe will be found to be somewhere near the truth is, that there was a union in that part of the country, at Brancepath, where they produced a very fine coke, and the union was very prominent, and these Messrs. Loves are very decided people. They had great reason they alleged to be aggrieved at the conduct of the men, and they came to a decision and gave the men notice that they would not employ a man of any description who was in the union, and when the notice was expired the men were ejected from the houses and there was a strike for many months, and Mr. Love succeeded. He got his colliery stocked with men who were non-unionists.

11,449. Was there not a dispute in the beginning in that case about the forfeiture of the corves?—Yes, there was; I believe the owners rather had the worst of it. It was something about the size of the tub and about the weighing of it; the men complained that they were sending more weight than they were being paid for.

11,450. Was not this the grievance which was alleged, that when the tub was sent up to the bank, if it was found on weighing to be below a certain weight, although it was almost up to it, it was forfeited and not paid for, although the coal itself went into the market in the ordinary way?—Yes, but that is not an unusual thing still.

11,451. I was going to ask you that question: there is a usual practice, is there not, of taking tubs which are short of weight, though three parts full, and not paying for them at all?—That is so.

11,452. Is that the practice in the whole of the northern districts?—I do not know whether it is so in the whole of the northern district, but it will be clear that there must be a point at which that must take place, and I do it in my places for this reason. Supposing a man was to take a fancy to send his tubs up half full, or supposing, for instance, they passed a resolution at a meeting to send the tubs up half full, the effect of that would be that inasmuch as I have to pay by the score, every other description of labour would be paid as though the tubs were full. The filling of the tubs entirely depends upon one man, and there is no reason except unwillingness and the spirit of doing what is not quite proper, to explain the sending of the tub up in that state, and therefore it is a regulation that the work shall be done in a certain way, and if it is not done in that way that is a penalty.

11,453. (*Mr. Roebuck.*) When you say, "If they passed a resolution," whom do you mean by "they"?—I mean the pitmen, supposing they passed a resolution one morning to send the tubs up half full.

11,454. Do the pitmen ever conspire together (I do not use the word offensively) or pass resolutions?—Yes; in the last 12 months I have known cases like this—if the fire coal which we give them is not good enough they will say, "If you do not send us better coal to-morrow we will not go to work until you do."

11,455. That happens without the aid of a trades union?—Yes.

11,456. (*Sir D. Gooch.*) Passing from the mere sending up of light weights, it is necessary, is it not, for the security of the men, as well as of the machinery, that men should not be allowed to send up excessive weights?—Yes.

11,457. And therefore you do not pay for any excess of weight?—Yes, we pay a man whatever he sends up; but we say, "There is a point at which we experience loss, because every other kind of expense arises upon this half tub just the same as if it were the whole tub, and therefore if I mulct the man who does the work improperly of his payment I am still a loser by it."

11,458. You do not only knock off what he sends deficient, but you knock off the whole tub?—Yes, if it is only a half tub.

11,459. If he sends up excess of weight you do not pay him, do you; at least they do not in the Rhonda valley?—We pay him every ounce.

11,460. He might load the tub dangerously, might he not?—The tub is only capable of carrying so much. I do not know that I ever knew one capable of carrying more than 25 cwt. Our power of engines is equal to the largest weight that the tub could carry.

11,461. (*Mr. Roebuck.*) Do you weigh every tub?—Every tub, and every man gets paid for every ounce that comes up.

11,462. (*Mr. Harrison.*) You will admit that the practice of confiscating a tub for being anything below the fixed standard might be worked in an oppressive manner?—Yes, but it is a matter of agreement, and you would be surprised how well the men know how to make their bargains; they are quite as well up to anything you have to say about what effects themselves as the master is.

11,463. In this particular case of the Loves colliery do you think that the men had no foundation?—I think they had some foundation for the course they took. I do not think that the owners, although successful, got well out of that; that is my opinion and I have often said so.

11,464. (*Mr. Roebuck.*) Have the workmen any very great interest in sending up tubs fuller than they ought to be?—Yes, they have an interest in that direction for this reason—supposing there are 20 men working, they get the tub turn and turn about, and those men may get one-fifth more by loading it in that way.

11,465. Will not a man have the same time given him to fill it in that the other men have to fill the lesser one?—Yes.

11,466. Must he not work very hard to make it fuller than they do?—No, very often they have not half enough tubs, and they could send twice as many as they get.

11,467. You do not supply them with a sufficient quantity of tubs to send as much as they can?—No, the trade does not allow it.

11,468. (*Mr. Harrison.*) Have you in Wales a practice of employing a cheque weighman elected by the men themselves?—In many cases that is carried out; but they do not like to pay them, and then they give them up, and so on. That cheque weighman at the top of the pit is very often a great source of mischief. We never object to him when they send him.

11,469. You cannot object to him, can you?—If they sent a mischievous fellow there I would object.

11,470. You can object to the individual but not to the principle?—No.

11,471. It is sanctioned by law, is it not?—It may be, at any rate it is reason that they ought to have one if they desired it.

11,472. (*Sir D. Gooch.*) Have your commission made a report on the coal trade yet?—No, but I think we will get it done this year.

11,473. (*Lord Elcho.*) During the many years you have had this large body of men under you you have not yourself had much trouble about the matter of wages?—I have myself, of course, had some trouble, but I am a great admirer of the pitmen. I do not think there is a finer body of men in the world than the pitmen in the country, and I think if you can inspire them with the feeling that you are fair and intend nothing but what is just towards them you can manage them.

11,474. (*Mr. Mathews.*) Do you speak not only of the north but of other districts?—I have been disappointed in Wales lately, but I believe I shall succeed there in time.

11,475. (*Lord Elcho.*) That is not a question of wages in Wales but a question of custom?—A question of custom.

11,476. (*Mr. Roebuck.*) In your endeavour to carry on your work or to settle questions between your workmen and yourself have you been much crossed by trades unions?—No.

11,477. Is that because your men do not work in

districts where trades unions exist?—We have had some disputes. Mr. Roberts used to come down; we called him our attorney-general, but those periods are so unfrequent that I should not like to see any legislation.

11,478. (*Lord Elcho.*) It was more in reference to questions of contract that Mr. Roberts appeared among you, was it not?—In 1844 he was the pitmen's attorney-general for nearly two years.

11,479. (*Mr. Roebuck.*) You say the times are infrequent when these things have occurred, are they times of high profits on your part or of low profits?—That is a question which has often occurred to myself; when we have the most difficulty with our people we are always making the most money.

M. G. Elliot.
10 March 1868.

11,480. In fact you have very little interference with you when trade is bad?—Very little, because when trade is bad work is slack, and of course that takes a good deal of the power of the unions out of them.

The witness withdrew.

Adjourned to Tuesday next, at 11 o'clock.

1, Park Prospect, Westminster, Tuesday, 17th March 1868.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.	JAMES BOOTH, Esq., C.B.
The Right Hon. the EARL of LICHFIELD.	JOHN ARTHUR ROEBUCK, Esq., M.P.
Lord ELCHO, M.P.	THOMAS HUGHES, Esq., M.P.
Sir DANIEL GOOCH, Bart., M.P.	FREDERIC HARRISON, Esq.
HERMAN MERIVALE, Esq., C.B.	WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. CHARLES MARKHAM examined.

Mr. C. Markham.
17 March 1868.

11,481. (*Chairman.*) Are you the manager of the Staveley Iron and Coal Company?—I am the engineer and managing director of that company.

11,482. How long have you been acquainted with the Staveley iron and coal mines?—I took the management of them in March 1864. Previous to that period I was an engineer on the Midland railway for 13 years, and previous to that (in 1846) I was engaged in some ironworks in France.

11,483. Have you had opportunities of seeing the action of unions in any of these works that you have been employed in?—Not to a very large extent.

11,484. In the case of the Staveley Iron and Coal Company have there been unions and has the action of those unions interfered with you?—An attempt was made to establish a miners union in the Derbyshire district, in September 1866, and a great effort was made to induce all our colliers to join the union. We resisted it and told the men that we would not employ union men under any consideration.

11,485. (*Mr. Mathews.*) Was there any union existing at the Staveley works previous to this period which you are speaking of?—No, there has not been for 20 years.

11,486. Those works are ironworks and collieries together are upon a large and extensive scale, are they not?—Yes, we employ between 4,000 and 5,000 men and boys.

11,487. There were no unions existing there previous to the period which you now refer to?—Not for 20 years. An attempt was made I believe 20 years ago.

11,488. Had the intercourse between the proprietors of the Staveley Company, which I believe is a limited liability company, and the men been of a friendly character?—A most friendly character.

11,489. There was nothing in the relation of the employers and workmen to justify the formation of a union to rectify any abuses?—I think not.

11,490. There was no indisposition on the part of the employers to have the freest intercourse with the men for the rectification of any disputes or grievances that might have existed?—Certainly not.

11,491. What was the object of the formation of a union with regard to the Staveley works. Was there any intimation made to the company that it was done to rectify grievances?—We understood from what transpired that they wished to become dictators of our property, and to manage our works in their own kind of way.

11,492. Was that wish expressed by the officers of any of these proposed unions, or by the men themselves?—It was mentioned at some of the meetings that took place.

11,493. It was expressed at public meetings and not in any direct intimation to you personally?—At public meetings.

11,494. (*Mr Harrison.*) Was it in these terms that the men wished to become dictators of the works?—That they wished to have a voice in the management or the control, and they stated that we had far more managers than were required. They thought that if a great number of the managers were discharged and the money divided amongst the workmen it would be better for them.

11,495. (*Mr. Mathews.*) Those opinions were expressed at the public meeting which you speak of for the formation of the union?—Yes.

11,496. There was no grievance on the score of wages, but they said that you employed too many managers, and that the wages paid to those managers should be distributed amongst the workmen?—As far as we personally knew of it the delegates said that they did not apply for more wages or any alteration, only that they sought to establish a union.

11,497. (*Mr. Roebuck.*) Will you make a clear distinction between what you heard the delegates say and what the men said?—I am stating what I heard that the delegates said.

11,498. (*Mr. Mathews.*) Was this intimation conveyed to you by the delegates?—No, I refused to see any delegates from the union.

11,499. You got it from public reports I suppose?—From the reports that were brought to me. I refused to see the delegates or to have anything at all to do with them.

11,500. You objected to see any delegates you say?—Any delegates that were not connected with our works. Of course if there were any delegates connected with our works I would see them, but I objected to see those who were imported into the district and had nothing to do with us.

11,501. What was the result, was it a strike?—Yes, a very violent strike. I may say that in September 1866 they organized a gigantic meeting at Chesterfield, composed, I should think, of many, many thousands of men. I should think two or three thousand of our men went to it. They stopped all our pits suddenly without any intimation, and the men ceased working all through the district. A day or two after-

M. C. Markham.

17 March 1868.

wards I sent for a deputation of the principal workmen, and I told them that whilst we were prepared to discuss with them any subject that might tend to our mutual benefit, we were determined that we would not allow a union to be established, and I warned them that if they insisted upon forming a union, we should take the strongest possible measures to resist it. They determined to establish a union, and after a week or two I ascertained the names of the chairmen and committee men and secretaries, amounting to 78, and I discharged the whole of them. I gave them a month's notice and they left. Subsequently to this there was a constant agitation going on, and whenever a person went to a meeting or took a prominent part in a meeting I discharged him. This led to 600 or 700 of the men giving notice to leave, and we kept giving notices to the men to leave and the men kept giving us notices, until at last we had nearly 3000 men under notice or on strike.

11,502. There was a battle between you representing that principle which you have described, and the men representing the union principle?—Yes; in November 1866 a great body of our men, who were never favorably disposed towards the union, came forward and formed a non-union movement. These men held meetings and gained strength from day to day, until I think we obtained at length 1,500 non-union men. Then it came to a point, and every man who was in the union had to leave or declare himself to be a non-union man.

11,503. A great number of the men whom you employ are still of opinion that a union was not necessary in your works?—The great bulk of them were of that opinion if they had not been excited, and I believe that the great body of them regret that that attempt was made; and if an attempt was made to form a union again, the great body I am satisfied would oppose it.

11,504. So that now the question has assumed this shape, you believing that unions are injurious to the works as well as to the men themselves, decline to carry on your works with the union men?—Yes.

11,505. You carry them on now with non-union men?—Yes.

11,506. Do you think that now that under that arrangement your works are conducted as well as they were before?—They are conducted on the same principle precisely. There was no union previously.

11,507. Your apprehensions were, that if a union were established it would be mischievous to the conduct of the works?—I apprehended that if a union were established we should be placed in the same position as the masters in Yorkshire, who never know from day to day whether the men are going to work or not. I believe that in Yorkshire two or three men may meet on the pit bank and have a conversation among themselves, and then order all the men to go away, and frequently the works are stopped without any tangible reason or any grievance that might not be settled in a kindly manner, and we apprehended that unions would cause a constant state of confusion with us, and be very disadvantageous to all parties.

11,508. So that from your observation where a union exists, the men are disposed to obey the dictates of their leaders rather than the dictates of their employers?—My belief is that it is so; but I am happy to say that I have not had much to do with union men in all my experience, and I have never felt any serious results from unions; but I know that a great many people have labored under immense difficulties, and that an immense number of employers of labor have been actually ruined by their proceedings.

11,509. So that you think that you go on much more amicably with your men, and that you conduct your works in a better way by its being understood that you will have no communication with organized officers of the union, but that you are open to communication with the men themselves?—Of course if there is the least grievance in the works we are always open to consider it and to reason with the men.

11,510. So that the operations of your works are carried on much more advantageously and in a much more conciliatory manner, employing as you do non-union men, than they are in the neighbouring works where they employ union men?—I may say with regard to all our works, that in Derbyshire and in Leicestershire there are no miners' unions established at the present time. There is a great struggle going on now in the Leicestershire district. The same people who created a disturbance at our works, when they found that they could not succeed with us, left and went into Leicestershire, and there they have carried on an agitation for more than 12 months.

11,511. So that the contention between the employers and the men in the neighbouring collieries, which you speak of, which has disturbed those works more or less for some time, you have been entirely exempt from?—Yes.

11,512. Your men get the general wages paid in the district, I presume?—I believe with regard to the wages in our district and in our works where the most perfect freedom of labour exists, that if you were to appoint a commission to enquire into the amount of wages, it would be found that the rate of wages in our district is higher than in any other union district in England. The population has increased during the last 10 years 60 per cent., and I believe that the people are better off than elsewhere. They have built more schools, the houses are much better, and the people are, I believe, better off in every way from the kindly feeling existing between master and man.

11,513. (*Mr. Roebuck.*) You say, as I understand you, that these delegates went from your pits to other pits to create the same disturbance, do you know who they were?—I said that certain delegates came from Yorkshire. There was a Mr. Brown who came from Yorkshire into our district and created a disturbance there, and subsequently he left our district in Derbyshire and went into Leicestershire, where, I believe he is now.

11,514. Did you not say also that the men who attempted to make the disturbance in your pits went away into Leicestershire?—There were not a great number of our own men who were leaders in that.

11,515. I refer to the delegates?—They left and went into Leicestershire.

11,516. Did you know their names?—I did not know them personally.

11,517. Do you know where they came from?—From Yorkshire. Mr. Brown came from Yorkshire, certainly.

11,518. (*Earl of Lichfield.*) Do you know to what union they belonged?—I do not; but Mr. Brown is a well-known man; he has been connected with strikes for years. I think he was in York prison; at all events he was tried at York some years ago for creating a disturbance with the colliers at Methley.

11,519. (*Mr. Mathews.*) Amongst all these men whom you employ have you any benefit societies organized for the use of the men employed in the works?—Yes, we have established an accident fund, which I have always thought very desirable, and we have contributed 2,000*l.* to start it, giving 500*l.* a year for the first four years, and after that period we subscribe 25 per cent. of the amount subscribed by the workmen. Each workman subscribes 2*d.* a week, and the boys subscribe half, and receive half the benefit.

11,520. Was that accident fund organized by yourself?—Yes.

11,521. How long ago?—I was arranging to establish a fund of that sort, soon after I went to the works.

11,522. Have you any rules of that fund to put in?—Yes (*handing in the same*).

11,523. Those rules describe, I suppose, the machinery on which your benefit societies are organized?—We have two funds—one is an accident fund. If any person meets with an accident, the committee, which consists of the officers of the company, together with a number of the workmen appointed by the body of workmen meet, and they can award a sum of money,

not exceeding 100*l.* to any person meeting with an accident. These rules have been examined and certified by Dr. Farr, at Somerset House. He has made a long report upon the rules, and is clearly of opinion that the funds are ample. The other fund is a sick fund, an ordinary benefit fund, in which the men pay 3*d.* a week.

11,524. Are these institutions managed jointly betwixt the officers of the works and people appointed by the men?—Yes.

11,525. They have a joint management with the officers of the works in the control and disposition of these funds.?—The first rule of the accident fund is this: "The managing committee of the fund shall "consist of the managing director, secretary of the "company, colliery viewer, assistant viewer, foundry "manager, superintendent of the works, accountant, "foreman fitter, surveyor and foundry foreman, "together with workmen from the several depart-"ments who have been employed by the Staveley "Company not less than two years, as under, viz.:— "one from each colliery, one from the ironstone pits, "one from the new foundry, one from the old foundry, "and one from the mechanics," and so on.

11,526. And you find that work satisfactorily?—Very.

11,527. Do you sustain a general and cordial relationship between the employers and workmen by the instrumentality of these societies?—I think so.

11,528. (*Mr. Roebuck.*) How long have these societies existed?—The sick fund has existed for a great number of years. I believe probably for 20 years, but I cannot say exactly how long.

11,529. Is it now solvent?—Certainly.

11,530. It has never been threatened with insolvency, perhaps?—If it were insolvent we should probably make up the balance. I think that at one time they got into debt to the amount of 400*l.* or 500*l.*, and Mr. Barrow, the proprietor, of the works paid the money.

11,531. Have you had the rules certified by any person authorized to certify such rules?—The accident fund has been recently reported upon by Dr. Farr. What is called the Field Club, or sick club. I do not think it has been certified by anybody.

11,532. So that you do not know, as far as actuaries could tell you, whether your sick fund has been established on proper economic principles or not?—We know that it is, because in the event of there not being sufficient monies we can make levies upon the workmen.

11,533. If you make a levy that argues that the rules are imperfect. But have you ever made a levy?—Never, I believe.

11,534. But you have never had them certified by an actuary?—No.

11,535. You have never been to Mr. Tidd Pratt, for instance?—No, I believe not.

11,536. (*Mr. Mathews.*) When the funds fall short do the principals contribute to the deficiency as well as the workmen?—Since I have been connected with the company the funds have always been sufficient to discharge all the liabilities.

11,537. Do the principals contribute to that sick fund?—No, the company do not subscribe to that fund—the men alone.

11,538. The workmen subscribe the whole of the fund, and the management of the fund is divided between the officers and the workmen?—The company do all the writing. They take the names of all the men, and collect the money and pay the people. There is a great deal of trouble and expense attending that, but that is all the company do towards that fund.

11,539. So that if the funds were to fall short you think that the obligation to meet the deficiency would be rather upon the workmen than upon the principals?—I think that if we found that the funds fell short we should subscribe a certain sum of money. The workmen and ourselves together would settle it.

11,540. There is nothing to render it obligatory on the part of the company to do so?—No.

11,541. (*Mr. Roebuck.*) You said, I think, that there was a subscription some time ago towards the fund by the proprietor?—Yes.

11,542. Was that to the sick fund?—Yes.

11,543. Though he was not connected with the sick fund as he was with the accident fund, he still, when the funds ran short, subscribed a sum of money to make the amount up?—I alluded to the late Mr. Richard Barrow. He, as proprietor, was the treasurer, and the accounts were kept in the office. In the course of a certain time there was a deficiency in the account, owing to several hundred pounds more having been paid than the receipts came to, and Mr. Barrow paid off the balance—that is to say, he transferred a sum of money to balance the accounts.

11,544. (*Mr. Hughes.*) There is nothing making the payment compulsory upon the master, but upon the workmen the payment is compulsory, as I understand you?—Yes; we do not employ anybody that does not subscribe to the funds.

11,545. You deduct a certain percentage of the wages for these purposes from every man whom you employ?—Not a percentage, a fixed sum—3*d.* a week for the sick fund and 2*d.* a week for the accident fund.

11,546. (*Mr. Harrison.*) By the 13th rule of the sick club I see that a member giving notice to leave his employment forfeits all claim to the funds of the club. Consequently the effect of that is this, is it not, that any man who leaves the works forfeits that portion of his wages which you have compulsorily retained?—Certainly not, because it has been found from experience that the sum of money collected is just about sufficient to defray the current expenses from year to year.

11,547. Is that an answer to my question, do you think?—I think so.

11,548. You say that you do not employ any man at your works who does not consent to become a subscriber of this fund in fact?—Yes.

11,549. The first rule is this: "That this society be "called the 'Staveley Works Club,' and every work-"ing man or boy who may be employed at the said "works shall be a member, in conformity with the "following rules," and you tell us that he has no option. Therefore, everyone employed at the works is a member of this society?—Yes.

11,550. Then I presume that your pay clerks stop out of the wages of every man and boy weekly the sum specified by these rules?—Yes.

11,551. Therefore at the end of the year so many pounds have been stopped out of the man's wages; that is so, is it not?—A certain sum, whatever it may be.

11,552. Then by rule 13 any man or boy who leaves your employment, who gives you notice in the ordinary way and chooses to walk off, leaves that sum in your hands and has no claim to it?—There is no sum left in our hands. I have stated that so far as the expense of working it for some time past goes there has actually been a deficiency.

11,553. There must be a sum of money left in your hands, must there not?—No, because I state that there has been a deficiency.

11,554. A.B. is a workman who has entered your employment and become a member of this society; you have stopped so many twopences a week year by year until there is 5*l.* stopped off that man's wages, which he has not received?—He may have received it or not. If he has not been ill he will not.

11,555. Supposing that he has not been ill, he has never come on the funds, and therefore there is 5*l.* in your hands. He gives you due legal notice to say that he requires to work elsewhere and by rule 13 he leaves that 5*l.* in your hands?—That 5*l.* has been paid to somebody else.

11,556. (*Mr. Booth.*) He has been entitled to the benefit in case of sickness?—Yes.

11,557. (*Mr. Harrison.*) You have retained 5*l.* out of his wages which he might have had if he had been ill; but if he has not been ill you retain it?—I may

Mr. C. Markham.

17 March 1868.

say that I do not think that very much arises out of it. As to these rules, both the accident and sick fund rules, I believe that there is not a man on our grounds that does not approve of them in every point of view.

11,558. I will put my question then in this way: Are you aware that it has been made a very grave charge against the practices of most unions, of all unions, I believe, that a man who ceases to be a member of one of those unions by his own free choice forfeits all the benefits for which he as hitherto subscribed. That has been charged has a serious injustice, has it not?—I think it is a very serious injustice.

11,559. Then you think that when a member of the union leaves the union, and by the rules forfeits what he has subscribed whilst a member, that is an injustice; but when a member of your union by giving notice ceases to be a member of the union you consider that that is no injustice. You put it in that way?—No, I put it in this way: that there is no injustice in the case of our own society, because the men only subscribe such a sum of money as about floats and balances the account. But in the case of the union, if a man subscribes 1*s.* a week and a large fund is collected and accumulated, I think if that man has subscribed for a number of years he is entitled to a certain amount of that fund if he leaves the union.

11,560. In your case he is entitled to nothing?—I think that if instead of subscribing 3*d.* a week he had subscribed say 6*d.* a week, and he left the society and there was a large accumulation, he should have a portion of it.

11,561. You put it in this way then, that a man subscribes 3*d.* a week for several years, then by giving notice he forfeits his claim to that; but if he subscribes 6*d.* a week to a union and forfeits it you consider that that is a hardship?—I wish to put it my own way. I say that in my opinion if a man subscribes 3*d.* a week and that 3*d.* a week is found to be just a sufficient sum to balance the account both ways it is quite fair that he should forfeit any claim on leaving. On the other hand if a man subscribed 1*s.* a week and there is a large fund accumulated, and the man has subscribed to the fund say about 20 years, I think if he leaves the union he is entitled to a portion of that accumulated fund; and in our case, if we were to compel a man to pay double the amount and we had a large fund accumulated I think that he would be entitled to a portion of it on leaving.

11,562. When you speak of balancing the account there is no balance to the individual who pays in respect of the advantage he has actually received is there?—It is a mutual assurance.

11,563. Is not that exactly the principle on which unions go when they forfeit the money that has been paid by their members?—Every penny that the men subscribe in our case is appropriated to the society, and it is all spent by them; but with regard to the union it is largely spent in fights and struggles, I believe.

11,564. Is not there this distinction between your union and the ordinary miners' union, namely, that in your union it is compulsory, no man having the opportunity of refusing to enter, but in the miners' unions it is at any rate open to his leaving or taking, as he pleases; is not there that great difference?—We have no union.

11,565. (*Mr. Roebuck.*) Are not the men fully aware of those obligations when they enter into a contract to work for you?—It is one of the conditions of our employment.

11,566. (*Mr. Harrison.*) It is compulsorily attached to the employment—a necessary condition of the employment?—In this sense it is not compulsory at all; a man need not come to us at all.

11,567. If a man were to refuse to continue to make the payments to this club you would turn him off?—Yes.

11,568. Do you publish balance sheets of this fund to the men?—Yes, certainly.

11,569. Are they printed?—No.

11,570. How are they published?—I dare say we shall print them for the future, but at the end of each year the accounts are balanced and certified and sent round to all the departments.

11,571. (*Mr. Mathews.*) When you say "certified" do you mean certified by the workmen on the one hand and the managers of the works on the other?—The principle of the management is that it is conducted partly by the men and partly by the officers of the company; it is a joint management. I took a very active part myself in forming that excellent fund on the Midland railway, which is formed on a similar principle. There the officers of the company and the men jointly manage the fund, and this fund was established on the same principle.

11,572. (*Mr. Harrison.*) Is there any foundation for a report which has been circulated to a great extent that the Staveley Works Club was a voluntary association, voluntarily formed by the workmen in your employment or in your district?—I believe it was formed 20 years ago, at all events, a great number of years ago, long before I knew anything about the works.

11,573. But in its present form it is entirely in the hands of the managers of the works, is it not?—No, it is jointly in the hands of the men and the masters.

11,574. In whose hands are the funds?—The funds are in the hands of the company.

11,575. Who makes the payments?—The company, or rather the secretary; there is a secretary appointed.

11,576. Who is the secretary now?—A man of the name of Hibbert.

11,577. What office does he hold in the works?—He is a clerk.

11,578. And nine of the officers of the company belong to the managing committee, do they not, officially?—Yes.

11,579. Rule 7 says: "The affairs of this club "shall be conducted by a managing committee, and "shall consist of the colliery viewer, secretary of "the company, foundry manager, superintendent of "works, accountant, foreman fitter, assistant viewer, "surveyor, and foundry foreman, together with nine "workmen who have been employed by the company "not less than two years."—Yes.

11,580. I suppose that the chairman has a casting vote, has he not, in the managing committee?—I suppose so.

11,581. Who is the chairman?—I generally am, whenever I am present.

11,582. The managing committee practically consists as a working majority, I presume, of the officers of the works?—It may or may not, just as it happens. The workmen always attend, because each workman is paid at the rate of 6*s.* a day for attending for half a day, and the officers seldom attend together.

11,583. (*Mr. Roebuck.*) Are the officers paid?—No, certainly not.

11,584. (*Mr. Harrison.*) In the case of a club which is managed by a committee so largely consisting of officers of the company, and of which the company retains the funds, and makes the payments, and stops the amount out of the men's wages, you can hardly call that a voluntary association, can you, which the men have entered into because they have an objection to unionism?—I never called it voluntary; it is compulsory in this sense, that it is part of our engagement to require the men to subscribe to the fund for their own benefit.

11,585. Then the statement which we have seen in the newspapers that the miners in the Staveley district have associated themselves together for the purpose of resisting the ravages of unionism is rather a figure of speech, is it not?—Certainly not, it is true. The men did form a non-union association, and if an attempt was made again to bring the union into our district they would resist it, I believe.

11,586. That is your opinion?—I am sure of it.

11,587. (*Mr. Hughes.*) You stated that this accident fund, as I understood, was in existence long before you came into the company?—Not the accident fund, the sick fund.

11,588. Then the accident fund is quite a new establishment?—Yes, quite new.

11,589. And it is the accident fund to which the firm subscribed 2,000*l.* at starting?—Yes, and they will pay 25 per cent. of the money subscribed after four years.

11,590. That accident fund, which has been recently established, and of which I hold in my hands the rules, has the same rules as to compulsory payment as the other?—Yes.

11,591. Are these "Rules of the Staveley Works Club" the rules of the old club that has been established 20 years?—No, the old club was entirely in the management of Mr. Barrow, and was managed in the office. When I became manager of the company I took a different view of it, and thought that the men who subscribe the money ought to manage their own business, and I formed those new rules by which the men had the opportunity of appointing nine workmen to take part in it.

11,592. You introduced the element of nine workmen into the management?—Yes.

11,593. As to those workmen being paid at the rate of 6*s.* a day, by whom are they paid?—Out of the fund.

11,594. Is not that a very high payment?—No, I think not. Some of the men have to come six or seven miles to the committee.

11,595. (*Mr. Harrison.*) Do you know any union that pays its delegates so high?—I know very little of unions.

11,596. (*Mr. Hughes.*) What would those men ordinarily save?—Those men as colliers earn from 6*s.* to 10*s.* a day.

11,597. Then probably the payment for attending the committee would not be much more than they would earn?—In the first instance, we paid a small amount to begin with, and found that the workmen did not attend. I inquired the reason of it, and they said that if it was not worth their while to attend, and as I thought it was much better to have a certain number of workmen to manage this fund, I proposed that the payment should be increased to induce them to come, and as many of them have to walk a long distance and very likely to lose a day's work, the amount was raised. I believe it is at the rate of 6*s.* now.

11,598. (*Mr. Roebuck.*) Have any complaints been made by the men themselves as to the working of this fund?—Certainly not.

11,599. Do you know whether any one has suggested to them that they have been ill-treated in the matter?—No, I am not aware that any question has ever arisen upon these rules or the management.

11,600. (*Mr. Harrison.*) Is your company in any way represented in any association of employers?—No, we are independent; we are not connected with any ironmasters' association or coalmasters' association.

11,601. And you have not been connected with any?—We never have been, and I totally disapprove of it. I think that freedom of labour and fair competition is the best for everybody.

11,602. You are not engaged in ironworks are you?—Yes, very largely.

11,603. (*Chairman.*) Is that pig-iron?—We manufactured last year nearly 30,000 tons of castings, and we have three blast furnaces besides. We have ironstone mines, and we furnish the iron in its manufactured state.

11,604. (*Mr. Harrison.*) You spoke of delegates from the union coming down, and that you said was the origin of the endeavour to carry the union into your district. What were these specific steps that were taken beyond the endeavour to form a union; did they make any demand upon the company with respect to the working of the company?—No. One of their arguments was this they said, "We want "nothing; we neither want advance of wages nor "any alteration at all, but we wish to establish a "union." I sent for a deputation of our men (I would not see any person not connected with our works), and told them that we were ready to discuss with them any subject or any grievances that they might have, but we would not employ union men. And we have quite made up our minds not to do so, be the consequences what they may.

11,605. What hours do your men work in the pits?—They do pretty well as they like; some of them work long hours, and some short hours.

11,606. (*Chairman.*) Are they paid by the quantity of coal?—Entirely by weight.

11,607. (*Mr. Harrison.*) Are the men paid uniformly by the ton?—I believe so; it may vary in districts. I am not practically acquainted with the details of the collieries, but I believe that as there may be more mining difficulties in one part of the pit than another the men are paid more in one part than in another.

11,608. What is the average of the hours of work do you suppose?—The pits now draw coal 10½ hours, but the colliers go into the pits and come out pretty well at what hours they like.

11,609. Have you ever had any question as to the hours of work?—Yes. The pits used to draw coal formerly 12 hours a day, and when the question was discussed after the union was all broken up I sent for a deputation of the men, and we talked the matter over, and we thought that we could do the work in 10½ hours, and our pits draw coal 10½ hours now instead of 12, as they formerly did. Everybody was paid by the ton, so that it made very little difference to us either one way or the other.

11,610. (*Mr. Roebuck.*) Why did you change from 12 hours to 10 if it made no difference to you or to the men?—Because I thought it was better in every way if the work could be done in 10 hours. 12 hours was a long time for the pony drivers and the boys.

11,611. The pony drivers attended I suppose upon the men who worked, and the pony drivers worked long hours because the men worked long hours?—Most of the colliers worked, I believe, eight or nine hours, but the pony drivers, who have to bring the coal from one part of the works to the other, had to be in the pit 12 hours.

11,612. Out of consideration to the lads you altered the hours of working?—That was one object. The men advocated the cause of the lads, and we thought it reasonable.

11,613. So that perfect liberty of the men is an injury to the pony drivers. When your hours were 12 hours a man if he pleased might work 12 hours, and thus compel a boy to work 12 hours?—He can work 12 hours now if he likes, but the coal is taken away from where it is worked at certain periods, and it is not necessary because a man works coal for 12 hours that there should always be a pony driver there to attend upon him for a similar period.

11,614. (*Mr. Hughes.*) You stated, did you not, that one of the complaints of your men when there was this union agitation was the number of the managers in the mine?—Yes.

11,615. Had you a great number more managers than usual?—We do everything we possibly can for safety; we think that it is a great thing to attain to, and I think there is a greater number of managers in our pits than will be found in most districts, and I believe it is owing in a great measure to the good organization we have that we are so free comparatively from accident.

11,616. (*Mr. Roebuck.*) When you say that you are free comparatively from accident, can you tell us the sort of comparison?—I think you will get that better from the government returns. I believe they are freer in Derbyshire and Nottinghamshire than in other districts.

11,617. Have you the double shift?—No.

Mr. C. Markham.

17 March 1868.

11,618. (*Mr. Hughes.*) Do the managers or deputies do any manual work?—No.

11,619. (*Mr. Harrison.*) What would be the greatest number of men at any time upon the sick fund?—I cannot tell you; sometimes it is very large.

11,620. On the sick fund only?—On both funds. There are a number of trifling accidents. We employ a good many Irishmen, and if they meet with the smallest injury they generally get upon the accident fund in one way or another.

11,621. What would be about the proportion?—I could send you a return of that, but I cannot give it now.

11,622. Does it go as high as 10 per cent.?—I could not say. I should think not.

11,623. Then the working of the thing is this, is it not. For every thousand workmen whom you employ, putting it at the outside, that one-tenth or 100 of them are in receipt of some benefit. As to 900 of them, if at any moment any one of those men desired to leave your employment he would have to sacrifice all that he had contributed whilst a member of the club?—I have spoken on that question several times, and I really can say no more about it. I say there is no accumulation in the fund. If there is one man that is receiving benefit he is receiving 5*s.* a week, whilst another man is only contribuing 3*d.* a week, consequently if one man in 20 is receiving benefit of course he absorbs the whole contributions of 20 men.

11,624. (*Mr. Roebuck.*) You consider that accident fund to be a sort of insurance fund?—Yes.

11,625. Would not a man subscribing to that fund be like a man insuring his house; he would derive the advantage of his house not being burnt down, but if it had been burnt down he would have been paid for it?—Yes, unquestionably. A great number of men have never been on this fund. One man lately said that he had been in the club 15 years and had never been on the fund at all.

11,626. He derived the same benefit as I should derive in insuring my house, my house not having been burnt down by fire?—Yes.

11,627. (*Mr. Hughes.*) There is a free labour union in your works, as I understand you, besides this club?—We have no free labour union. When the union movement came to an end we broke everything of the sort up, and reverted to our former position.

11,628. Then as to the 1,500 non-union men in your works, who, you told us in November 1866 came forward and organized a movement antagonistic to the union movement; that dropped to pieces again and the men have not continued that?—Certainly not, we have reverted to our former position—the men are at perfect liberty to combine together and do what they like, and we are at perfect liberty to meet them.

11,629. Do they combine together?—No, there has been no combination.

11,630. (*Mr. Harrison.*) But they are not at liberty to combine amongst themselves, are they?—Yes.

11,631. (*Mr. Hughes.*) Is there any organization in your works at which the men can consider the question of an advance of wages, for instance?—Of course they can meet together and discuss that, and do what they like about it.

11,632. But is there any organization in which they can discuss it?—No, no regular organization; but if the men thought they were entitled to an advance of wages they would meet together and come to see us.

11,633. (*Mr. Mathews.*) They would naturally meet together on the pay day?—They always have an opportunity of discussing any subject they wish.

11,634. (*Mr. Hughes.*) In these conferences which you have had with them at different times, and at which you say they are able to bring forward any subject or consider any grievance they have, has the question of a rise of wages been considered between the managers and the men?—When the strike came to an end, of course our trade was very much broken up, and we soon found that we had not full employment for our men, and from that period there has been a great depression in the trade. An advance of wages has not been considered at all, nor have we at present considered the subject of decreasing the wages.

11,635. Then there have been no communications between you and the men as a body with respect to that?—At various times certainly there has been.

11,636. Not since the strike of 1866?—No.

11,637. (*Lord Elcho.*) How does that communication take place, is it with the whole body of men that you communicate?—The men generally send a deputation.

11,638. (*Chairman.*) Is there any term of hiring by the twelvemonths or any longer term considered advisable?—We either give or receive a month's notice.

11,639. (*Mr. Mathews.*) You make the contract subject to a month's notice on either side?—Yes.

11,640. It is perfectly understood that that is the case?—Yes, they have to sign the colliery rules, and that is one of the rules.

11,641. With respect to this sick fund, is it an object to accumulate any amount of this sick fund or do the men merely subscribe what is sufficient to carry it on?—The fund has been in existence a great number of years, and the amount subscribed appears to be just about sufficient to balance the account. There has been no accumulation, and no very great deficiency. What deficiency there has been was made up by the late proprietor, Mr. Richard Barrow.

11,642. If the fund were to accumulate to any great extent you would consider the propriety of decreasing the payment, I presume?—We should either increase the benefit or decrease the payment.

11,643. In point of fact there is no beneficial interest in the sick fund on the part of anybody?—Not at all.

11,644. And the men understand that there is no beneficial investment on their part to the fund beyond the weekly contribution?—Yes.

11,645. Is this sick fund distinct from the accident fund?—Yes, it is a separate fund.

11,646. With respect to the accident fund, does that provide for deferred payments in case of accidents?—The committee have unlimited power to deal with the fund as they think fit. There is at the present time the case of a poor man who was blind in one eye, and in our shop the other day when chipping a piece of iron he lost the other eye. The committee will probably award that man 100*l.*; they have given him 15*l.* already, and he, I believe, bought a mangle or something of the sort, and the rest of the money will be appropriated in such a way as the committee think for the true benefit of the family and the man himself.

11,647. But instead of giving 100*l.* at once; are there any deferred weekly payments?—The committee have perfect power to deal with that as they think fit. If any great calamity were to occur, they would be compelled to make deferred payments, because all the funds would be absorbed.

11,648. In case of deferred payments, if a man were to leave your employment, would those deferred payments be sacrificed by him?—If a man met with an accident in our works, he would be entitled to a certain sum of money whether he left our employment or not.

11,649. So that his beneficial interest would continue in fact under your rules, notwithstanding his leaving your employment?—Yes, if he met with the accident whilst working in our works.

11,650. (*Mr. Booth.*) He does not in fact subscribe more than his chance of benefit is worth?—He may or may not do so.

11,651. You propose to calculate upon this footing, that the subscription, whatever it is, shall just correspond to the amount of benefit a man is likely to receive?—It is calculated upon that basis, and the subscription of the company of 25 per cent. of the amount subscribed by the workmen, is supposed by Dr. Farr to cover all cases that can occur.

11,652. In fact he receives more than his own sub-

scription would be entitled to; he receives what the company give in addition?—Yes, and that addition may go forward perhaps to accumulation.

11,653. (*Mr. Mathews.*) In addition to this sick fund and accident fund, have you any fund for schools?—Yes, we contribute to nearly all the schools in the district; we have built schools that cost about 5,000*l.*, we provide a schoolmaster and schoolmistress, in fact several of them, and employ a Scripture reader, and we subscribe to nearly all the schools all round the district, and we have recently given 600*l.* to build another school at Staveley.

11,654. So that you, having the responsibility of employing this large number of men your ground for discountenancing these unions is that they may interfere very seriously and prejudicially with your sick fund, accident fund, and everything else which you do for the benefit of the men?—If a union were to be established at our works of course all such relations between ourselves and our men would entirely cease; we should break up our schools and let the men do what they like.

11,655. So that the christian obligation which now subsists between the masters and the men, the masters considering themselves responsible to do what they can for the benefit of the men, and the men looking up to the masters, would be broken up by the union?—Yes. We consider ourselves morally bound at present to do all we can for the benefit of the men and their children.

11,656. (*Mr. Harrison.*) You say that if a union were to be established at your works you would break up your schools; why should you break up your schools?—If a union were to be established we never could have any reliance upon our men; one day they might be working, and another day they might be doing just as they liked, and there would be no friendly relations between us, our relations would be disturbed by delegates coming from all parts of the country. I think we should then in all probability say to the men, "We shall simply employ you, and pay you your "wages, and you may take your own course and do "as you like."

11,657. Do you mean that in cases where unions are established men work one day and do not work the next?—That is the case in Yorkshire to a great extent, I believe.

11,658. (*Mr. Mathews.*) You consider that the effect of the union would be this, that the relationship between you in the case of the union taking the management of the men would be one simply of business, and that the social relationship which has existed so long would be broken?—I am clearly of that opinion and I believe that if you were to appoint a commission you would find that in union districts very little is done by the masters for the benefit of the men.

11,659. Under that conviction you have thought it best both for the benefit of the men, and in the interests of the work of which you have the charge to discountenance unions altogether?—Yes.

11,660. (*Chairman.*) Does the system of hiring by the month impede any such action as you would be likely to complain of on the part of the union men coming on suddenly and breaking off suddenly?—No, I think not for the same rule I believe exists in Yorkshire—there the men are engaged for a certain period but they may stop suddenly.

11,661. How can that be done without a breach of contract?—There is a breach of contract; but when 600 or 700 men cease working on a given day, you cannot take them all before the magistrate.

11,662. You do not seem to attach any weight to a breach of contract?—There is no doubt that it was a breach of contract, when the men formed on the 6th of September this great meeting at Chesterfield, which I have mentioned, and 2,000 or 3,000 of our men went away, we had the power of summoning the men before the magistrates, but we did not do so.

11,663. (*Sir D. Gooch.*) You have had to do with railways I believe?—Yes, I was for 13 years assistant engineer on the Midland.

11,664. And the same system is carried out there with regard to the sick fund as you have described, I believe?—Yes.

11,665. And that is compulsory upon the servants of the railway company?—It is compulsory upon certain servants of the company, but not upon all.

11,666. (*Mr. Hughes.*) When those 2,000 or 3,000 men of yours went to this great union meeting, you took the matter into your own hands I understood you to say, and discharged them?—I sent a day or two after the excitement had gone by for a deputation of all the principal men, and I dare say about 150 of them came, and I told them that be the consequences what they might, I would not allow a trades union to be established on our ground. They set me at defiance and formed their lodges, and I ascertained the names of the chairmen, secretaries, and treasurers, and discharged them.

11,667. Without regard to the contract?—No, I gave them a months notice.

11,668. (*Mr. Mathews.*) You have had some knowledge I believe of the condition of workmen both in France and Belgium, have you not?—Yes; from 1846, until after the revolution, I was the managing partner at Marquise.

11,669. What is your opinion of the relative efficiency of Belgian and French workmen as compared with the English?—In my judgment a Belgian or French workman is as good a workman as an English workman is. When I was a lad we used to talk of two Frenchmen being equal to an Englishman; but when we had those works we came to the conclusion that the French and Belgian workmen, in point of money value, were worth more to us than Englishmen. At one time we had from 500 to 600 Englishmen at Guines and Marquise, but when the French revolution came upon us I had only one Englishman with me at Marquise, because we found that we could get the work done so much cheaper by French and Belgians.

11,670. As to the relative remuneration which Belgian workmen get, what is it compared with that of an Englishman?—It is very different.

11,671. What percentage should you think a Belgian works cheaper?—I should think he works for half the money.

11,672. So that, given an equality of ingenuity and ability on the part of the Belgian and the English workman, the Belgian would work just that much cheaper by the difference in wages?—Yes.

11,673. And if the wages of English workmen were to advance very materially beyond the rate in Belgium work now done in England must of necessity go to Belgium, must it not?—With regard to the coal and iron trade, I do not think it would, because of the immense facilities we have in this country. The quantities of coal and ironstone here are so large compared with what they are in Belgium and France that I think we have advantages in this country so largely in favour of England that in coal and iron England will always maintain its supremacy. But with regard to machinery I am clearly of opinion that in the course of a few years there must be an immense change, and if I were to begin life again and to be the manager of mechanical works I should rather begin in Belgium than in England, because the Belgian workman (and the French workman too) is extremely steady and industrious, and there is no reason why machinery should not be manufactured much cheaper in Belgium and France than in England, chiefly because of trades unions.

11,674. (*Mr. Roebuck.*) Are the Belgian and French workmen more docile than the English?—I have the most kindly recollection of the Belgian and French workmen; they are most civil and obliging and industrious; they have the best feeling in every kind of way.

11,675. Has there been any introduction into Belgium or into France of trades unions?—I am not

Mr. C. Markham.

17 March 1868.

aware of it. They had no trades unions when I was there.

11,676. When you speak of the Belgian and French workmen, you mean supposing them not to be interfered with by trades unions?—Yes.

11,677. (*Mr. Merivale.*) How long had you experience on the Continent?—I went to France in 1846, and I left early in 1849.

11,678. When you left those works at Guines and Marquise, did other capitalists continue them?—No. We made a large sum whilst we were there, and paid off the money which we had borrowed, and when the French revolution came upon us, there was an entire collapse in the trade of France, and ultimately we had to leave the country.

11,679. (*Mr. Roebuck.*) Was there any attempt made on the part of the French authorities or workmen to drive away the English workmen?—No. The Guines works have never been carried on since then, but the Marquise works have been worked by a Frenchman, and were described in the "Times" the other day by Mr. Plimsoll.

11,680. If Belgian workmen are as good workmen as the English, and at the same time cheaper, what in your judgment is the reason why English capital has not gone there?—With regard to the Guines and Marquise, they are ironworks, all the coal which we brought to those works came from England, and except for the high tariff preventing competition in France in those days, we should not have succeeded so well as we did.

11,681. In your opinion, the reason why English capital has not continued to work profitably in Belgium and France is not the inferiority of the workmen, but the geographical disadvantages of the country?—Yes.

11,682. With regard to machinery, did you yourself ever engage in the business of machinery abroad?—No. Of course, I have been connected with machinery nearly all my life.

11,683. Do you know other English residents who have engaged in that business abroad?—Yes; I believe Mr. Cockerell has at Liege. But there is a very large locomotive establishment in Prussia, where they are gaining a very good position in the trade.

11,684. If it be true that the workmen abroad are as useful as English workmen or more so, and there are no other causes to the contrary, I want to know why English capital does not settle there in the machinery constructing business?—Take, as an example, the Exhibition of 1851 and compare the machinery exhibited there with that exhibited in the Exhibition of last year. In my judgment there have been most gigantic strides in the improvement of machinery in Belgium and Prussia, comparing 1851 with 1867.

11,685. That being so, why is it that English capital does not go out there to seek investment in the production of machinery?—I think it will do so, but an Englishman would naturally rather work in his own country not being acquainted with the language of the other country, and there are many difficulties to contend with. There was an establishment started at Rouen by some English capitalists, which has been a most successful affair.

11,686. Do you know who those capitalists are?—Yes; Mr. Allcard (who has since died) and Mr. Buddicombe, and they made large fortunes there. I was asked to go out and establish similar works in Spain, but I refused to go.

11,687. In fact this competition is prospective competition; you do not think that it has come to pass?—I think that with regard to machinery, the French manufacture is likely to be a powerful competition.

11,688. I rather wanted to know whether it had begun?—I do not think so.

11,689. (*Mr. Mathews.*) Has it not begun at the Creusot works in France in regard to engines?—Yes; they have brought some from those works, which are now running on the Great Eastern Railway.

11690. (*Sir D. Gooch.*) Has there not of late years been a great demand for English capital in that particular branch of machinery, in this country?—There has been a great development during the last 20 years of machinery and tool shops in this country until the last year or two.

11,691. Now the times have changed; the French have improved very much; business in this country is getting slack, and the time is coming when the circumstances will be changed?—I think so.

11,692. (*Mr. Hughes.*) You say that the Belgian workman's wages are not so much as the English workman's. They are very much less, are they not?—The common labourers we used to pay in France a franc and a half a day, and a very good labourer 1 franc 75 centimes.

11,693. With respect to the docility of the Belgian workpeople, I suppose you saw the account last year of the calling out of troops there in consequence of the late strike?—Yes.

11,694. Are you aware that troops have also been called out within the last four or five years in Belgium on another occasion for the same purpose?—I have seen it in the newspapers.

11,695. That does not look like much docility?—I do not know that. A few men get together sometimes and they excite a large crowd, and a disturbance takes place, and in France and Belgium things are very different from what they are in this country, they make a great deal more of such a thing there; if there is the least disturbance there you find a great mass of soldiers brought from all parts.

11,696. But you would not refer that to the unions, would you?—I like neither one nor the other.

11,697. (*Mr. Harrison.*) You say that the low rates at which the Belgians compete with the English are due to the absence of unionism?—I am not aware that there are unions in Belgium. I am strongly impressed myself with the conviction that there ought to be the most perfect freedom of labour in every way. I believe, in regard to the shipbuilders in the east of London, that if there had been freedom of labour and no trades unions, a great number of those poor fellows would have been dispersed about the country and would have found employment, taking reduced rates of wages—the employers would have given employment to a great number of them instead of the men breaking stones to get bread.

11,698. Do you know anything about the shipbuilding union in London; do you know anything more, I mean, than what you have read in the papers?—It is chiefly that. I am informed that one man who was a very good workman, a boiler-maker, was offered employment in our district at fair wages. The man asked the union if he might be allowed to go, and they said, "No, the rate of wages which you are offered is "less than what we will allow you to take," and that man was actually at the time going from day to day to break stones. The trades union would not allow him to take work at a price less than that which their rules and regulations sanctioned.

11,699. (*Mr. Booth.*) I think I understood you to say that if your workmen have anything to complain of, either as to the rate of wages or otherwise, there is no difficulty whatever in their having communication with the manager of the works?—None whatever; we are always glad to see them, because we believe that if any difficulty or misunderstanding arises between the men and ourselves it is much better to talk the matter over and clear it up than let it go on to some chronic difficulty.

11,700. In that respect, then, they are as well off as the men in the union?—I think better, because they can appoint whom they like, and they can come themselves if they like, but in the union they would have to leave it to the delegates.

11,701. A rise of wages has occurred as much in your works, I suppose, as where there have been trades unions?—There has been no trades union in our district for 20 years, and I believe that if you were to appoint a commission you would find that the rate of wages paid by us is higher than in any other district of the country where unions are in existence,

or else I do not think that men would come from all parts of the country, as they do, to us.

11,702. (*Lord Elcho.*) You employ a great many Irish, I think; how does that happen? do you get Irish labour cheaper than other labour?—We have 700 or 800 houses of our own, but the Irish do not live in those houses. There is a special train that leaves Chesterfield every morning, and they come down in the morning by that train.

11,703. Do you take the Irish labourer from choice?—No, there is no choice in it at all. If anybody who is suitable comes to our works we employ him, whether Irish, Welsh, or English.

11,704. You do not employ an Irishman because he is cheaper?—No.

11,705. (*Mr. Roebuck.*) You could not get him cheaper, I suppose, because he is paid by the ton?—Labourers are paid by the day generally.

11,706. (*Mr. Mathews.*) Do you get many skilled workmen from the Irish?—It is a very remarkable fact, so far as my experience goes (and I know most of the workshops in the country), that I hardly know a single Irish foreman. I rarely find an Irish foreman in any place of trust or great responsibility.

11,707. Do you infer from that that the general ability of Irishmen is on a lower scale than that of Englishmen?—I do not know what the reason of it is.

11,708. (*Mr. Hughes.*) Could you without trouble give us a statement as to the average of your wages during, say, the last five years, so that we should have an opportunity of comparing it with the average of other districts?—I think that it would be rather a difficult thing to do, because all our people are paid by contract, and we do not keep an account of what the men earn, and they do not like us to know what they do earn; some men earn a great deal more money than they wish us to know.

11,709. (*Mr. Harrison*). By "contract" do you mean the butty system, that one man takes a piece of work and engages a number of men under him?—Yes, a certain number of colliers take a stall and divide the money amongst them.

11,710. (*Mr. Roebuck.*) That is common to all England, is it not?—I do not know. That is the system we adopt.

11,711. (*Mr. Harrison*) Do you mean that the men working under a piece contract receive higher wages than the miners in Yorkshire working on their own account?—I believe it is on the same plan in Yorkshire.

11,712. Do you know that it is the same in Yorkshire?—No. I would be very glad, if you wish, to send our viewer here. He is a man who was right-hand man to George Stephenson, and George Stephenson had great reliance in him.

11,713. The company on their pay days pay directly the head man who has taken a stall, I suppose?—Yes.

11,714. They do not pay the men whom he employs under him or who works along with him?—No, they pay one man; we pay all the labourers individually, but there are a certain number of coal getters that are paid as I have described.

11,715. What is the average number of the men who work in a gang?—I should think three or four of them work together.

11,716. You pay one out of the four?—Yes.

11,717. Do you know officially what he pays the other three?—No; but as I do not know the details of this management, I would rather not give evidence upon it.

11,718. Your evidence is that the men, as a rule, throughout your works receive higher wages than what they do in other districts where there is a union?—I have no doubt of it.

11,719. Do you know I ask, and if so, how do you know what three out of every four of the coal getters receive?—I do not know that. All we know is this, that people come to us from every part of the country, and we are told that they come to us because they get more wages with us.

11,720. You do not know and therefore you cannot speak on that point, what the daily earnings are?—I cannot speak positively. I believe that many of the colliers make from 6*s.* to 10*s.* a day.

11,721. The undermen, do you mean?—No, the leading men.

11,722. Do not you know that it is an universal rule almost, that where that contract system is in vogue, the under hands receive lower wages than what they do when each man works alone and is paid for his own tub?—I do not know positively about that, but if they come to us and four or five men wish to work all together and divide their money, they do it just as they like.

11,723. But do you deny that where men work on this contract system, the under men receive lower rates by the week?—In all probability the most intelligent man who took the contract would get more wages as a matter of course. I believe in everything being done by contract and piece work. I think that it will become universal, and that the only mode of getting rid of trades unions will be by adopting an universal system of piece work.

11,724. You do not deny that these under men receive less than when they work each man on his own footing?—A man goes in as an inferior workman, with a skilled workman, and as he becomes more skilful he gets promoted and becomes a contractor himself in course of time.

11,725. Have you evidence as to the wages which the men are receiving in relation to these people who take the contract?—I speak of the whole of them. The only real question about wages is, can you get plenty of men? If there is no difficulty in getting labour, but men come to us from different parts of the country and say that they are better rewarded for their labour by us; that is the best test I know.

11,726. (*Lord Elcho.*) At the works which you managed abroad, was there a piece work system?—Yes, almost entirely; all the mines were worked entirely by piece work.

11,727. How many men had you there?—I should think 700 or 800 at Marquise and about the same number at Guines.

11,728. It has been stated in evidence here that the reason why men can be got at lower wages in Belgium, is that the men there have got land of their own. Are you aware whether your workmen had land of their own?—Our works were in France, between Calais and Boulogne. We employed a great number of Belgians, but of course they had not land in France.

11,729. Had the French workmen land of their own?—Yes; a great many of the French men no doubt had small plots of land.

11,730. What would be the extent of those plots?—Very small indeed. When a person dies in France the land is divided and sub-divided.

11,731. Would the plot of land be what would be equivalent to a garden here?—Yes, I should say so, nothing more than that.

11,732. (*Mr. Harrison.*) Do you think that the Belgian or the French miner manages to live altogether in as much comfort as the English?—Yes; I think they do in their way, but then their ways are so different. If they have a cup of coffee, soup, and bread, and an apple, they seem quite contented.

11,733. Without animal food?—They cannot afford animal food, at least they could not in those days. I would like to mention that I have a very strong feeling myself that there ought to be a great effort made to protect people in their right to work and labour wherever they think fit. During our strike we had to send for a large body of police to escort our men to and from our works, and I think it a great injustice that we were compelled to provide a police force for that purpose. I think it is the duty of the country to protect every man in his rights and liberties, and that, if a man chooses to work as a non-union man, he should not be insulted by a body of union men. I think that he should have perfect security to go along Her Majesty's high roads without being in constant fear of

Mr. C. Markham.

17 March 1868.

violence and intimidation. If we could only do away with violence and intimidation, and fear, I believe that trades unions need not be dreaded in any kind of way; at the same time the men should have the right of combining and forming trades unions so long as they did not interfere with freedom of labour.

11,734. (*Mr. Merivale.*) How would you do away with it?—I would make the law very severe—I would not allow picqueting. If a union man was to meet a non-union man and insult him, by calling him "black sheep" and so on, the law should be that he should be very severely punished.

11,735. (*Mr. Harrison.*) It does punish him now, does it not?—No; it is of no use at all.

11,736. (*Mr. Hughes.*) Would you punish him severely for calling a man "black sheep?"—I would certainly, because a person of education can hardly understand the feeling of a workman passing among a crowd of them and women, and children, and being insulted by them; it wants a man of very strong moral nerve and very strong determination to pass through it.

11,737. (*Mr. Harrison.*) The women are not members of the union, are they?—No, but often they are most active in it.

11,738. (*Mr. Merivale.*) Then it is not a change of the law that is required, but you think that the law is not administered as severely as it ought to be?—Not in that respect. In the midst of our strike I sent an agent down into Cornwall to engage a number of Cornish men. The moment the delegates heard that we had sent an agent down there we were followed there by Mr. Brown, and the most lively statements were made by him to prevent us from engaging work-people there. We did engage a large number, and brought them to our works in a special train. We took them to a colliery that was isolated from the rest. They arrived at the colliery about 10 o'clock, and I expected that next day that there would be a great demonstration of union men to drive these people away, and I arranged for a body of police to be in attendance. As I expected, they got a body together of 500 or 600 people, who came on purpose, with their drums and kettles to frighten and intimidate these Cornish people. We luckily met them with the body of police, who informed them that the road where they were was a private road, and that they would not be allowed to pass, and they withdrew. The same sort of thing happened in Staffordshire. We sent for a body of men, and when they arrived they were met by a number of men and insulted, and abused in a way that was very injurious indeed—it was very insulting and very degrading. I think it is very desirable that some strong law should be passed. I do not believe that the leading delegates are ever parties to violence or intimidation, but the system is that the union people generally combine together and they insult these poor people and drive them away, and carry on these strikes for a much longer time than they otherwise would. I have a very strong feeling also that these combinations of masters are very injurious to working men, and I think that the policy which has been pursued by trades unions of destroying small employers of labour has also been very injurious to them. Recently a large strike took place in the north of England to resist a reduction of 10 per cent. among the ironworkers. The masters combined together and beat the men. Immediately after this the masters combined again and reduced the men again 10 per cent., and recently there has been another meeting of the masters, and they have reduced the men again 10 per cent., and I believe that capital will always beat the men, and that it is the interest of men to have as many employers of labour as possible and perfect freedom of labour, and then I think everything would find its level, and people would be absorbed in various trades and they would do as they liked, and it would be better for working men in every way. Amongst the building trades, for instance, I believe that if when they are slack of work they were allowed to work at a lower rate of wages, they would build more cottages and it would be better for working men in every way. Previous to my being summoned to this Commission, there was a meeting at Mr. Gladstone's on the subject of trades unions, and I wrote a letter to Mr. Gladstone expressing my views on the subject, and if the Commission desire it I will put it in.

11,739. (*Chairman*). Will you read it?—The letter is as follows:—"Sir, I observe in the papers that you "are about to receive a deputation of trade union "delegates and to discuss with them the advantages "or otherwise of their unions. Having been con-"nected with the working class all my life, and having "been opposed to all those regulations that interfere "with the freedom and liberty of labour, I have pre-"sumed to offer a few remarks for your consideration. "In the first place I maintain that labour is a market-"able commodity, and is subject to the ordinary laws "that govern supply and demand. In making this "assertion I except those cases of what I call con-"spiracy. In many of the Sheffield and other trades, "men who exercise their right to work in defiance of "union regulations do so in the constant terror of "violent assaults. In my opinion the gigantic com-"bination of the engine drivers on all the principal "railways in England was also a conspiracy; and as "far as I am able to judge if the men had been true "to one another they might have stopped or mate-"rially interfered with the traffic of the country. "Having formerly been connected with the Midland "Company for 13 years as one of their engineers, I "can bear testimony to the steady and industrious "habits of the enginemen and firemen not only upon "that railway but the class as a body. For many years "past it has been the policy of railway companies to "employ lads as engine cleaners and gradually to "promote them to the position of drivers and to give "a preference by promotion only, and most railway "companies have not hitherto employed engine-"drivers, but have trained them on their respective "railways. On the ground of equity and justice, the "system has been fair and judicious, and has enabled "the industrious and steady youth to obtain a certain "position in course of time. The reward for this "kindness and consideration was met on the part of "the men with a combination, and which in my "opinion should be designated conspiracy, for all the "men were keenly sensible that if their business was "open to competition the supply of men would soon "be greater than the demand. The North Eastern "Railway with great determination and ability resisted "the conspiracy that was formed against them, and "having been successful they practically broke up the "combination. A great disturbance was created in "this neighbourhood about 18 months ago by delegates "from the collieries union in Yorkshire. I was in-"formed that the object and intention of the union "was to become practically dictators in the manage-"ment of our property. I told the men at once that "I was willing to discuss any subject that might tend "to promote our mutual interest, but at the same time "I would not under any circumstances employ union "men, as I was convinced they would sooner or later "destroy our trade and connexion, and more especially "as we were not connected in any way with a coal "and ironmasters union. A violent strike was the "result, and lasted for nearly five months, and ter-"minated by the men agreeing to our original deter-"mination. Trades unions have of late years "extended the basis of their operations, and if a "difference of opinion exists in any branch of trade "and a strike follows, the various trades of the "country are called upon to contribute and defeat "the employer. If he is in a small way of business "with a limited capital they may succeed, and the "fact is the unions have of late years destroyed and "broken up an immense numbers of small employers "of labour, and the trade of the country is gradually "drifting into the hands of large capitalists. Trade "combinations have been followed by an association "of masters in different parts of the country, and it

" necessarily follows whenever large bodies of manu-
" facturers combine against the dictates of the unions
" they must defeat them, as the capitalists can allow
" their works to remain idle whilst the poor working
" man is unable to obtain wages for the maintenance
" of himself and family. It has recently been urged
" in the public press, by Mr. Potter, that the combi-
" nations in the building trade have enabled them to
" raise the wages to a considerable extent. It is
" probable such has been the direct result, as the
" demand for labour in the building trade has been
" very considerable, but this result has probably been
" more injurious to the working man than to any
" other class. Houses have to be provided, and as
" they are generally the property of people who invest
" their savings, and to produce them a fair amount of
" interest, the direct result has been that the cottage
" accommodation is being gradually diminished. If
" 10 per cent. is added to the cost of building, 10 per
" cent. of accommodation is curtailed, and many fac-
" tories and workshops are not built, simply on
" account of the additional cost. We have built a
" large number of cottages and have provided three
" bedrooms to each house, and as we only charge
" 2*s.* 6*d.* per week for rent to our colliers, which
" also includes a garden and pigstye, we look
" beyond the simple interest for our investment
" in obtaining the most skilful and steady work-
" men. Limitation of apprentices is the most cruel
" injustice to the families of working men, most of
" whom however have been brought up in the belief
" of the benefits of such limitation. It is clear that
" where the number of apprentices is limited the
" children of the parents must become common
" labourers or soldiers, or be maintained by their
" parents or the parish. If the most perfect freedom
" of labour prevailed in every branch of trade every
" one would find his own level; the production of
" many articles would be materially cheapened, and
" no people would benefit more in the aggregate than
" the working classes themselves. In this district
" where the iron and coal industries have undergone
" a rapid development during the last 20 years, the
" most perfect freedom of labour prevails, and if a
" commission was appointed I believe they would
" find that taking all things into consideration the
" men earn more money, are provided with better
" schools, and are gradually becoming more intelligent
" than in those districts where the unions are almost
" omnipotent. Much has been said of the advance
" of wages by the trade union delegates, but they
" totally lose sight of the fact that wages of every
" description have risen during the last 20 years.
" Amongst domestic servants wages have probably
" increased 100 per cent. during the above period,
" and this great change in their position has been
" accomplished without combinations, and simply
" from the law of supply and demand. No manu-
" facturer can pay less for his labour than its proper
" value, if he attempts to do so he collects around
" him an inferior class of workmen, and ultimately
" gets beaten in the race of competition. I have long
" viewed with much misgivings the combinations of
" masters against their workpeople, and nothing
" would induce me to join such a combination except
" under the greatest pressure, but if I was connected
" with a small business and a limited capital, I should
" be compelled greatly against my will to join a
" mutual association for the protection of my property.
" A very recent reduction has been again made in
" the wages of the iron workers in the North of
" England, and it was I believe accomplished with
" little difficulty by the combination of large employ-
" ers of labour. Such combinations must be most
" injurious to the interests of working men. In this
" district the men go from one works to another, and
" they frequently leave their work with one employer
" in the evening, and make arrangements to begin
" work with another employer the following morning,
" and by this system they gradually raise labour to
" its marketable value. No one feels stronger than I
" do that some national benefit and provident
" societies should be established, by which working
" men could invest their savings and insure their
" lives. It is true that the Post Office Savings Banks
" are doing great good, but still the working man can
" only invest his savings at a lower rate of interest than
" any other class. A very small weekly payment is
" sufficient to insure workmen against accidents, but
" trades unions have not I believe dealt with this
" subject in a comprehensive manner. Mr. Potter will
" probably inform you that trades unions do not limit
" the rates of wages, although they fix the minimum
" rate. Such a statement is practically deceptive, as
" employers well know that if they were to give
" their best men a higher rate of wages than the
" average they would soon be compelled to advance
" the wages of the inferior workmen. By the rules
" of many trades unions the most experienced work-
" man receives the same amount of money as the idle
" apprentice who has recently served his time. With
" regard to the hours of labour I have always viewed
" that question as one open to grave consideration,
" but I believe it must ultimately be settled, in a
" great measure, by competition in other parts of the
" world. It has usually been considered by mechanics
" that 57½ hours is a week's work, and it has always
" appeared to me strange that trades delegates have
" not endeavoured to reduce the hours of labour to a
" considerable extent. At the same time I look for-
" ward to the settlement of this question by the
" adoption of piece work, which must in my judgment,
" sooner or later, become universal. The attempts
" that have been made successfully by trades unions
" to prevent a man from putting forth his whole
" strength and preventing him from earning such a
" sum as is suitable to his wants and requirements is
" a gross injustice against the skilful man. Some
" men can do nearly double the amount of work that
" an inferior workman can, but by the present system
" the skilful man is brought down to the inferior
" level. Every one must admit that the working
" man has the right of obtaining the highest remu-
" neration he can for his labour, and it is his duty to
" do so. I fear I have intruded too much upon your
" time, but as the subject you are about to discuss is
" one of gigantic importance, I thought under the
" circumstances you might not be indisposed to con-
" sider the opinions of one who believes himself to be
" as well a wisher of the working class as can be
" found amongst men engaged in commercial pursuits,
" and one who believes and has always expressed the
" opinion that the interests of the employer and
" employed are identical. The works which I have
" charge of probably support a population of 14,000 or
" 15,000, as we employ between 4,000 and 5,000 men
" and boys. I am sir, your obedient servant, Charles
" Markham."

11,740. (*Mr. Harrison.*) Are the statements in that paper based on any personal experience of the action of trades unions that have come before you in your own business.—I have been connected with the working classes for 25 years. I have had to do with large bodies of men all my life, and my sympathies and feelings are all with the working men.

11,741. Have you been manager or officer, or had the charge of works in which trades unions have actually interfered with the management?—No, certainly not. I have happily not been connected with any works where trades unions have been omnipotent in any kind of way.

11,742. (*Mr. Mathews.*) As a man of ordinary observation, would it be possible for you to live in a district where you were surrounded by trades unions without having a knowledge of their policy and results?—Of course I have always taken a great interest in the way they were carrying on their business, and always had a great dread of them. I was connected with the Eastern Counties in 1850, when the strike of the engine drivers took place, and a more wicked thing I believe was never done by trades union people. Mr. John V. Gooch, who was formerly the locomotive engineer of the South-Western, came to the Great Eastern, and some two or three men misconducted themselves, and were fined by him. Nearly all the engine drivers sent in their notices, and the result

Mr. C. Markham.

17 March 1868.

was a general strike upon the railway. I took a very active part in that struggle—the great body of the men left the service, and their places were filled up by others, and the difficulty was got over without causing public inconvenience, but the poor fellows that gave in their notices were dispersed over all the country, and they suffered great privations. I think a more wicked and wanton strike was never started than that.

11,743. (*Mr. Roebuck.*) How do you connect that with trades unions?—There was a trades union of these engine drivers, and they had a meeting, and they very probably thought they could stop the traffic of the railway.

11,744. It was distinctly a trades union meeting, and they struck as trades unionists?—Yes.

11,745. (*Lord Elcho.*) Have you any moulders and mill-men who are in the union?—Yes. Some of our moulders have been connected with the society for years, and they said that if I wished they would withdraw, but I said "you have not interfered with "our rights as masters, and so long as you conduct "yourselves in the same way in which you always "have done, I do not wish to interfere with you or "to make you withdraw, and I will give you an "indemnity, that in case any accident occurs to you "you shall receive the benefit from the fund, although "there is a rule stating that no person connected "with a trades union shall receive any benefit from "it."

11,746. (*Mr. Harrison.*) Then the only union men whom you actually employ have never given you the least trouble?—No, if they did we would not have them on the ground.

11,747. (*Mr. Mathews.*) Your collieries are on a large scale, are they not?—Yes.

11,748. Have you much piece work?—Yes.

11,749. In the manufacture of pipes, for instance, one man undertakes to make the pipes at so much per ton?—Yes.

11,750. In the case of the employment of men under this piece work system there is no obstacle to the men emerging to the condition of over men, is there?—They generally do. If a person has more aptitude for business in any kind of way than others he is put forward at once, and soon gets on.

11,751. So that is a very good school of emulation for the workmen, and helps any superior workmen to work themselves up gradually?—I think that almost all the foremen in the country have worked themselves up on that principle.

11,752. You consider that your work is better done on that principle than if you had no piece work?—We could not manage it without.

11,753. The men are perfectly satisfied with it I suppose?—Yes; they prefer it very much with us, because they are enabled to do as they like, and can earn either much or little money,

11,754. (*Mr. Roebuck.*) Will you tell me whether the general education of your workmen (more especially of your skilled workmen) has improved of late years?—I have no hesitation at all in saying that in the education of our people a very great improvement has taken place in our district.

11,755. You do not think that any mischief arises from a boy going partly to school and partly being occupied in his business?—I think myself (and have rather strong views about the matter) that no boy should be allowed to go to work that cannot read and write—and if he can read and write, I think that the rest of the education should be done in a great measure by himself. I think that this new Act will be attended with great difficulties. In many cases lads maintain a poor widow and part of the family, and to withdraw them altogether would be a cruel wrong to the family. But if a boy can read and write well, with the facilities of a cheap press, and the use of libraries about the country, if he has any emulation in him he will rise to the surface in the present day.

11,756. Have you paid any attention to the late discussions that have taken place about what is called technical education?—Yes.

11,757. What is your view about that?—I think that there is a great deal of nonsense in it.

11,758. (*Mr. Hughes.*) I quite agree with you in your view about the boys not being allowed to go into the pit until they can read and write well, but that a little conflicts with your view as to unlimited competition of labour, does it not?—I think not. If I had my way I would not allow any lad to be employed that cannot read and write. With regard to technical education, I think that if you look into any of our large workshops where perhaps you may find 2,000 or 3,000 men, there probably will be very few men in that large body of men that will take any interest in it. For instance, in large factories now, everything is subdivided—labour is subdivided into various sections; an employer of labour wants a man to do merely a certain operation and no more; and, with regard to foremen, even amongst the superior class, you will find very few of them that will take any interest in technical education. I think that there ought to be great facilities in the way of models, libraries, and schools, where a person, if he has an aptitude and desire to receive technical education, should be able to do so. But to give all the mechanics of the country technical education, I think, is very absurd.

The following statement was handed in by the witness:

STAVELEY WORKS WORKMEN'S CLUB ACCOUNT.—Receipts and Expenditure for 10 years, from 1st January 1858 to 31st December 1867.

RECEIPTS.					EXPENDITURE.	Amount paid to members, including medicine, attendance, &c., &c.			Management and Stationery.			Total.

		£ 19,419	15	5							£	19,419	15	5

Note.—By this statement it is shown that the total expense of the fund for 10 years, during which nearly 20,000*l.* has been received from and disbursed among the workmen, has amounted to only 173*l.* 17*s.* 4*d.*, or to less than nine-tenths per cent. of the receipts.

E. BEDDOW, Accountant.

STAVELEY WORKS WORKMEN'S SICK AND ACCIDENT FUNDS.

Mr. C. Markham.

17 March 1868

I hereby certify that the amount received from the workmen on account of the sick and accident funds during the six months ending 8th February 1868, was as follows:—

	£	s.	d.
On account of the sick fund - -	1,149	18	7
On account of the accident fund - -	756	14	5
Add contributed by the Staveley Coal and Iron Co. Limited, (1st instalment of £2,000) paid 24th August 1867 -	500	0	0
	£2,406	13	0
Less, payments to members, medical attendance, and management:—			
On account of the sick fund 1,167 17 7			
On account of the accident fund - - - 422 15 0			
	1,590	12	7
	£ 816	0	5

The cost of management for the two funds being as follows:—Ten workmen are paid 3*s.* each and 1 workman 7*s.*, (the latter including railway fare,) for each attendance. Committee meetings are held once in each month, and if all the 11 working men attend each meeting, the yearly payment will be 22*l.* 4*s.* 0*d.*, which is equally divided between the two funds.

The salary of the Secretary to the sick fund is 15*l.* per annum, the salary of the Secretary to the accident fund is 10*l.* per annum, making a total of 47*l.* 4*s.* 0*d.* per annum for management of the two funds, or 23*l.* 12*s.* 0*d.* for the six months.

E. BEDDOW,

Accountant to the Staveley Coal and Iron Co., Limited.

27th March 1868.

The witness withdrew.

Mr. WILLIAM OUTTERSON WOOD examined.

Mr. W. O. Wood.

11,759. (*Chairman.*) Are you managing director or viewer of a colliery?—I am the manager at Messrs. Strakers and Love's collieries.

11,760. Where are those collieries?—In Durham.

11,761. How many men are there working in the collieries?—We have 2,925 men and boys.

11,762. Are they coal mines only, or coal and iron?—Coal.

11,763. (*Mr. Roebuck.*) Is it Brancepeth colliery?—Brancepeth and Willington collieries.

11,764. (*Chairman.*) How long have you had the management of those collieries?—I have been with the firm for seven years.

11,765. When you began was there any action of unions in that neighbourhood?—None at all.

11,766. Since you began has the action of unions been felt?—In the summer and autumn of 1863 we had delegates from Yorkshire and from Northumberland who came into the district. The colliers in the district were all induced to join. Our collieries (we have five of them) were the last that joined.

11,767. What particular effect had that upon the relation between the working men and those who employed them?—It had a most unpleasant effect; it placed the men in an altogether antagonistic position to their employers.

11,768. Can you give specific instances to show when matters were at peace and amicable terms prevailed between you and your workmen how did the change begin?—Yes.

11,769. (*Lord Elcho.*) First of all, will you tell us for how many years those collieries had been worked without strikes?—Since 1844. I have already said that in 1863 delegates came from Northumberland and Yorkshire. The men were summoned to meetings, and the delegates asked the men to join the union, promised that they would obtain them higher wages and shorten the hours of labour; and, in fact, proposed a sort of Utopian scheme altogether—the men were to have anything they wanted almost. They used very strong expressions. They told the men that they were oppressed, that they were so many slaves, and so on.

11,770. (*Chairman.*) What are the wages now, and what were the wages then?—The wages at present are from 4*d.* to 6*d.* a day better than they were then. At that time the good men were making 5*s.* a day, they are now making 5*s.* 6*d.* With that they have their house and coal and garden free, except a small payment of 6*d.* a fortnight for leading their fire coal.

11,771. (*Lord Elcho.*) How long have the wages been so raised?—We raised the wages in 1865.

11,772. (*Chairman.*) You say that your men have house and garden and fuel free?—Yes.

11,773. And the fuel brought to their premises?—Yes, for 6*d.* a fortnight.

11,774. As much as they like?—Yes, as much as they can burn.

11,775. (*Mr. Roebuck.*) At the time of the strike what were the men making?—Good men were making 5*s.*, some of them 6*s.*, 7*s.*, and 8*s.*

11,776. Did the strike cause the rise of wages?—No.

11,777. Did that rise of wages follow upon the increased improvement of trade?—Yes.

11,778. A rise of wages would have taken place without any assistance from the union?—Yes, in fact there was no union then. When the wages were raised, the union had long been broken up.

11,779. (*Chairman.*) What was the way in which they began to interfere with what you describe as the happy course of management?—I was going on to say that the action taken by the union delegates or agents in all the collieries was as follows: they called meetings of the men, formed a committee for each firm, and a sub-committee for each pit. There was a secretary and treasurer for each committee. The delegates were paid so much per week, about 30*s.* a week, and the treasurers and secretaries about 25*s.* a week. They proposed to have the control of the works in a great measure. All disputes between the employers and the men were to be referred to the union committee for settlement. The collieries in the district were induced to join. As I have said, our collieries were the last that joined.

11,780. (*Mr. Roebuck.*) You mean that the men of the collieries joined?—Yes. Emboldened by rapidly increasing numbers the delegates proceeded to unfold their plans. After a course of "Restriction" (which I shall explain to the Commission presently), the men on certain collieries which should be selected were to make certain demands. If these demands were not conceded the men were to strike. The other collieries in the district remaining at work were to contribute towards the support of those men who were on strike, and thus prolong the strike to an indefinite extent, expecting to be able to reduce the employers to submission. First of all, the trial properly commenced with several small employers. At one colliery, Inkerman colliery at Towlaw, the masters employed some men who were obnoxious to the union, and the leaders of the union told the colliers what they were to do. They turned out of work, stopped the pit, and refused to proceed to work until the men who had had notice were again employed. The same thing was the case with some men who were obnoxious to the union who were employed at Hunwick colliery. Two men were discharged, they were members of the union. The men turned out of work, and would not proceed to work again till those men were restored. At Spennymoor colliery the overman of the pit gave some offence to the men, and they insisted on his being discharged. The owners did not feel inclined to discharge him, and a six weeks strike ensued. Ultimately

Mr. W. O. Wood.

17 March 1868.

the owners were reduced to the necessity of turning the man off altogether; they had no fault to find with him at all, but the only reason was that they were compelled to discharge him by the union men.

11,781. (*Chairman.*) Did it appear how these men became obnoxious to the union men?—Because they were not members and would not join.

11,782. (*Mr. Harrison.*) What was the charge made against the overman?—The men said that he was not fit to have charge of the pit, and they wished to appoint a man of their own choosing.

11,783. (*Chairman.*) They must have said something specific, I presume?—That was all the charge they made, that he was not fit to have charge of the men, or of the pit, and they wished to have somebody whom they liked better. The fact of the matter was that they wished to have a man appointed who would favour them if possible.

11,784. Generally the overlooker, who is unpopular with the men, is so because he does his duty, is he not?—Very frequently so. I will further go on to state what was done at Bolckow and Vaughan's colliery, close to our Bitchburn works. Our Bitchburn men asked for an advance of a shilling a score, which would be equivalent to about 1*d.* a ton. The owners gave it to them. At Messrs. Bolckow and Vaughan's, men working the same seam and the same coal came out and made an application for 1*s.* 6*d.* per score. They gave it to them. Our men came out on strike again, but they did not get anything. They saw that it was of no use demanding those excessive wages, and they went in. Bolckow and Vaughan, whose iron works were dependent upon the supply of coke to keep them going, were obliged to give way. Ultimately they demanded as much as 3*s.* a score advance. The owners could not possibly comply with that, and a strike ensued which lasted about six weeks, and then the men went in again at the original price.

11,785. Was the strike founded on any other principle than that there was a chance of getting the wages if the strike was inconvenient. Had there been a rise in the price of the coal, for instance?—None at all; in fact, just at that time trade was rather slacker than it had been for some time.

11,786. They demanded it because they thought they would get it?—They demanded it because they thought they would get it.

11,787. (*Mr. Roebuck.*) How do you connect this with the union?—Because there was no demand of anything of the kind made previous to the establishment of the union in the district.

11,788. Then the establishment of the union being followed by this strike, you believe that the existence of the union was the cause of the strike?—Yes.

11,789. (*Chairman.*) What did the employers do; did they take any action against the establishment of unions?—They took no united action.

11,790. Did any individuals try to resist the introduction of unions?—Yes; Messrs. Strakers and Love, seeing what the result of the union management was in other places, determined to prevent, if possible, the carrying out of the principle on their collieries, of which I am manager. They are a wealthy firm, and the union delegates discussed the point as to whether a demand should be made first on Messrs. Strakers and Love's collieries, or on Messrs. Pease's, who are next to them. They wished to take the strongest first, so that if they could possibly defeat the strongest they would have the remainder at their mercy. They then carried out a principle which I have before named, that of "restriction;" each man's wages were restricted to 3*s.* per day; independent of the situation of the man or his family, he was to earn no more, and he was to earn no less. This was a very great loss to the owner. The mines produced considerably less coal, the same incidental expenses went on, pumping water, keeping the mine in proper repair, and so on. We found that we could not allow this to go on, and gave notice to the leading men, the secretaries and treasurers and committee-men, and altogether discharged about 42. We gave them 14 days' notice, that being the term of hiring with us.

11,791. (*Mr. Mathews.*) The leading men were in your employ?—They were the leaders of the union on our works. After we gave notice to these they were supported out of the union fund; they were allowed 15*s.* per week. They remained in their houses, which were our property, after their time was up. We were obliged to turn them out and make room for others. The men carried out the restriction principle. I should have said their idea was that they would limit the produce of coals from the mine, reduce the stock on the colliery in case of a strike, reduce the supply to the market, increase the price of coal, and thus raise the wages.

11,792. (*Lord Elcho.*) Have you any written papers stating those objects?—No; but I was told these things by the delegates and the men themselves. I was intimately mixed up with the whole affair.

11,793. (*Mr. Mathews.*) And those objects were avowed by them?—Yes.

11,794. (*Lord Elcho.*) The officers of the union told you that their intentions were to insist upon those things which you have just mentioned?—The officers of the union told me that they were restricting the men's wages to 3*s.* a day for the purpose of reducing the supplies to the market, increasing the price of coal in the market, and raising the wages.

11,795. (*Chairman.*) How did restricting the wages to 3*s.* a day diminish the quantity of coal raised? Were the men paid according to the quantity of coal they raised?—The men were paid according to the quantity of coal they raised.

11,796. And they were not allowed to raise more than 3*s.* worth of coal?—They were not allowed to raise more than 3*s.* worth of coal, whereas before this restriction men were raising as much as 6*s.*, 7*s.*, and 8*s.* worth.

11,797. (*Mr. Mathews.*) The restriction in the wages was equivalent to a restriction in the get?—Yes.

11,798. (*Chairman.*) Did that speculation succeed? No; it was a very foolish idea to attempt such a thing.

11,799. (*Mr. Roebuck.*) What was the result?—They went on and carried the restriction principle still farther, and ultimately reduced the men to 1*s.* 3*d.* a day. We gave notice to the officials and discharged them. It was when we did that they reduced at our collieries the earnings to 1*s.* 3*d.* a day. All the collieries in the district were meanwhile restricted to 3*s.* The next thing was, they struck work without notice of one kind or another.

11,800. (*Chairman.*) What was the term of hiring with you?—14 days.

11,801. And they struck at the moment?—They struck without any notice whatever.

11,802. (*Mr. Roebuck.*) What did you do?—We brought the ringleaders before the magistrates. They were discharged by the magistrates on account of a want of mutuality in the agreement and the loose way of hiring.

11,803. (*Mr. Mathews.*) The contract was a bad one?—It was not a bad one, but we had no signed bonds; it was a word of mouth hiring, on the custom of the country.

11,804. (*Mr. Harrison.*) A long report of that appeared in the local papers at the time, did it not?—Yes.

11,805. Perhaps you can let us have a copy of that?—I have no copy by me. I have merely a statement of the heads of the affair.

11,806. (*Chairman.*) Were your works stopped?—The works were entirely stopped, we had 1,056 men out on strike. 660 coal hewers came out first, and then induced the men working in the coke yards (we make a large quantity of coke) to come out with them. 396 came out with them, making a total of 1,056.

11,807. (*Mr. Booth.*) What was the immediate cause of that strike?—The discharge of the union

officials was the immediate cause of it. No demand was made until after they had struck work. A circular was then sent in to the owners of which I can give you a copy.

11,808. (*Mr. Mathews.*) Will you read it?—This circular was sent to the managing partner of the firm: "To the Honourable Joseph Love, Esq. "Honoured Sir—We the miners of Brancepeth "colliery do hereby desire the restoration of our "sacrificed men to their usual employment," (that refers to the men we turned off, namely, the officials of the union,) "and we hope that your benevo- "lence will be so kind as to grant us our request, "as we want to go to no stringent measures to- "wards their restoration. Also we want to have a "weigh on the bank top to weigh our coals with, and "a weigh-man of our own to see it justified, and to "be paid by ton." Then comes a list of the prices they wanted, which was an increase from about 25 to 33 per cent. "The under-named prices are a "list of what we want for yard work: siding over, "9*d.* per yard; winning head-ways, 1*s.* 4*d.* per yard; "walls, 1*s.* 2*d.* per yard, including stone; also "all narrow boards, 1*s.* per yard; holing a board "narrow, 1*s.* per yard; and for turning a board "away 2 yards wide, and laying her out wide, 3*s.* "The following prices for the coal per ton: the north- "way whole coal, 1*s.* 3*d.* per ton; the southway whole "coal, 1*s.* 1½*d.* per ton; and all broken 1*s.* per ton." The prices previously paid were 9¼*d.* per ton.

118,09. (*Lord Elcho.*) One of the things mentioned there is the weighing at the pit's mouth, is it not?—Yes.

11,810. Has any change been made in that respect?—We conceded that point to them at once.

11,811. That has been made the subject of parliamentary inquiry, has it not?—I do not know whether it has since then.

11,812. I think the subject of weighing at the pit's mouth was brought before the Mines Committee?—I daresay it was. We conceded that point at once, and it was of course followed up by the demand for the restoration of the "sacrificed men," that is to say, the men who were discharged, and also for this increase in wages, which amounted to from 25 to 33 per cent. It would have cost the owners 20,000*l.* a year to have acceded to it.

11,813. (*Chairman.*) Had it any effect upon the trade of the district?—It had a very great effect upon the trade of the district. Do you refer to the coal and coke trade?

11,814. I want to know any prejudicial effect upon the district which you think arose from the strike. It stopped the supply of coal, that is self-evident?—Yes, and we lost orders.

11,815. Then when they returned to work did not the consumers of coal come again for the article?—No, our sale is chiefly by means of contracts. During the strike we were unable to take up any contracts, and lost a great many of the contracts which we had. It thoroughly disorganized our trade, and almost completely destroyed the business.

11,816. Will you give us an example of what sort of contracts you mean?—We contract to supply so many hundred tons of coals or coke per week to either blast furnaces or railways, or anything of that sort, perhaps for 12 months, or a term of years.

11,817. All those contracts were stopped and your competitors had an advantage over you?—Yes.

11,818. (*Mr. Booth.*) Did it lead to the stoppage of any of those blast furnaces?—It led to a great deal of inconvenience.

11,819. (*Mr. Harrison.*) Did these transactions take place in 1863?—In the winter of 1863 and the beginning of 1864. It lasted for 17 weeks.

11,820. I believe it especially applied to the Brancepeth colliery?—Yes.

11,821. Was not the principal feature of that dispute that it referred to the question of total forfeiture of the tubs which were sent up short of weight?—That was one question in it.

11,822. Was not it the principal question?—No, it was not the principal question. That was the reason which was given by the men, but there was another behind it, namely, an increase of wages.

11,823. But the practice of the works at the time was, that if a tub under a specified weight were sent up it was not paid for at all, and it was forfeited out of the wages of the men?—Just so.

11,824. That had led for a long time to very great disputes, had it not?—No, it never had before; the question was never raised before.

11,825. What was the weight under which the tub was forfeited?—There were different weights according to the various collieries. We paid there by measure, and if the tub did not come to bank containing so much coal it was confiscated. The amount of confiscated tubs came to one per cent. of the total quantity drawn from the pits.

11,826. At the time of the strike, do you mean?—Yes, at the time of the strike.

11,827. (*Mr. Booth.*) As soon as the question was raised the point was conceded?—Yes it was conceded at once.

11,828. (*Chairman.*) Was there any attempt to get the sympathy of the public or subscriptions from them?—There was a great deal of gross exaggeration of the state of the case. Misrepresentations of every kind and description were made. The owners were abused and the agents under them also. Every description of epithet that could be possibly employed of an insulting and degrading nature was applied to them. The men gave up work. The houses were the property of the owners, but the men refused to quit the houses. We served a notice upon them, which I shall put in. Although they had no right to keep possession of the houses one day after they ceased their work, we served this notice upon them: "Take notice, that "by your having absented yourself from our service "you have determined and broken your contract of "hiring with us, and we do hereby require you to "deliver up to us the possession of the cottage house "which you have occupied as our servant before the "27th day of October 1863, and in default of your "so doing you will be turned out of possession." They took no notice of that; we gave them a week's grace, and then proceeded to eject a certain number of families at each place. We ejected 20 or 30 families in each colliery.

11,829. Did you go before the county court, or eject them by policemen?—We had a large number of policemen on the ground at the time, and we employed men who went in, brought out the goods, and took them wherever the people wanted them taken.

11,830. (*Mr. Harrison.*) Did the houses remain empty?—We wanted the houses to put other men into.

11,831. Did they remain empty?—For a short time.

11,832. (*Chairman.*) And you were enabled to put other tenants in?—We were obliged to turn them out on account of the intimidation going on. They abused the men going to work, and did everything in their power to annoy them, and we were obliged to barricade the houses, so as not to allow any of the union men access to the villages.

11,833. (*Mr. Harrison.*)—You did not actually fill the houses out of which you turned those men?—We could not do so at the time.

11,834. You did not want the houses, but you turned the men out?—We turned the men out to prevent them from intimidating the others.

11,835. (*Mr. Booth.*) You wanted to have the houses ready in case you should get other men?—Yes.

11,836. (*Mr. Harrison.*) They did not come, however?—Yes, they came. Then finding that this first notice was of very little use we gave to the men remaining in a further notice:—"Notice is hereby "given.—The owners of Brancepeth, Oakenshaw, and "Sunny Brow collieries offer to give each man living "in their houses and having given up their work 10*s.*, "on condition that he removes his furniture within

Mr. W. O. Wood.

17 March 1868.

"seven days of this date, November 4th, 1863. The "money will be paid on delivery of the key." We also gave them this notice:—"Notice is hereby given "that the owners of Brancepeth, Oakenshaw, Sunny "Brow, and Brandon collieries are prepared, in seven "days from this date, to remove by railway or waggon "the men on strike, with their wives, families, and "furniture, who are occupying the owners' houses, to "any village or town in the county of Durham, and "to give them 5*s.* towards paying their lodgings until "they have time to get work elsewhere." This was of no use, the men still remained in their houses under the direction of the union delegates. It was to obtain the sympathy and support of the public by being turned out that they took that course. As I said before we had a large number of policemen on the works. At one time we had 95 policemen on the ground and 96 specials sworn in, and it required all those men to protect the works. There were night attacks made on the collieries by men who had their faces blackened, armed with sticks and pokers, &c., and we were obliged to arm the constabulary to withstand their attacks. By order of the magistrates the police were allowed to wear their cutlasses during the time this was going on; there were 13 cases of intimidation brought before the magistrates, 10 of which were sent to quarter sessions, and a great many cases of violence occurred in which we could find no trace of the parties.

11,837. (*Lord Elcho.*) Were convictions obtained in all those 13 cases?—Convictions were obtained in all the 10 cases that were sent to the quarter sessions. We had to pay those policemen 15*s.* a week each; the average number of policemen on the works was 70.

11,838. For how long?—For 16 weeks. The strike lasted for 17 weeks, but we did without them the first week, and then they remained to the end. Every man at work received threatening letters, of which I have some copies here as specimens. They were sent in the form of a sort of circular. People were told to prepare for their death, and that their coffins were got ready, and graves were prepared for them, and so on.

11,839. Will you read some of those?—"Dear "Friend, this is to inform you that you are one of the "men that got the men to work, and you must pre- "pare to meet your God, for death is at hand, it will "come by night or by day." Another is, "My dear "Friend, I write these few lines to you to inform "you that Mr. Ruxton, the priest of Willington "church, has got orders to get some graves ready, "and you must prepare yourself for it, and you must "make the best of your time in praying to your "Maker, for your time is but short in this world, for it "will come to you by night or by day." Another is, "Dear Friend, this is to inform you that you must "get prepared for your death, for Mr. Ruxton has got "orders for some graves to be ready as soon as pos- "sible. Get prepared, for you are one that will "suffer. You are one of the men that has got the "other men to work, and there is other two or three "that must prepare, but they will get their summons "as well as you." These letters were sent to all the men working.

11,840. Did you make any attempt to trace them?—We put the letters into the hands of the police, but they could make nothing of them.

11,841. (*Chairman.*) Were they from your own post office, or were they sent to a distance to be posted?—Some of them came from Durham, some from Willington, and a lot were slipped under the doors. The consequence was that a number of the men whom we got at work, what the unionists call "blacklegs," were so frightened that they gave over.

11,842. (*Lord Elcho.*) Then those letters did produce some effect?—Yes, and we had to provide an escort of policemen to protect the men to and from their work. They used to have tin cans, bricks, stones, and other missiles thrown at them.

11,843. With regard to those cases in which the men were committed, were they committed for causing general disturbance or for some individual outrage?—For individual violence in many cases.

11,844. On person or property?—On person. We had our property so well guarded that they could not do anything there. They made two or three night attempts; bodies of men from 300 to 400 formed within a short distance of the colliery, and walked up to attack it, but found the policemen there with their cutlasses, and they could not face the steel.

11,845. Were they armed?—Yes, with sticks, and bars of iron, &c.

11,846. In these cases of outrage were the persons injured?—Yes, severely.

11,847. How?—By sticks and stones.

11,848. Were there any attempts to destroy any property by blowing up houses in that district, anything in the way of what they call "bottling?"—Nothing of that kind was done.

11,849. (*Earl of Lichfield.*) Were you present on any of these occasions?—I was present. I was knocked down one day.

11,850. (*Lord Elcho.*) Was that one of the cases sent for trial?—No, that man got a month from the magistrate.

11,851. Will you tell us what happened in that case?—We had been turning the men out of their houses at Brandpeth; there was a tremendous crowd and a great riot; they were throwing sticks and half-bricks and stones. We were escorting those men who had been turning the men on strike out of their houses to a place near the railway station to get refreshment. I was at the head of a column of police escorting those men. Stones were flying about. I turned and walked backward, so as to be able to see what was coming, so as to stop any stones that I might see which might have hit me. On my doing so one of the men put his leg behind me and tried to throw me over. If I had been thrown over probably I should have been seriously injured. The policeman that was alongside of me saw the man who did it, and pointed him out; we got a warrant for him, brought him up before the magistrate, and he got a month for it. The stones and bricks were flying like hail.

11,852. (*Chairman.*) What particular thing fetched you to the ground?—The policeman just saved me.

11,853. (*Lord Elcho.*) You were only tripped up?—The man put his leg out to trip me up, and was going to strike at me; if it had not been for the policeman I should have been injured.

11,854. (*Chairman.*) The men resumed work, as I understand you, after 17 weeks, what was the state of things then?—The men did not all resume work then; I went into Scotland and got a number of men from there, a number of men were got from Cumberland, and we manned the collieries as far as possible with non-union men. The owners issued an order that no union man would be employed. They were willing, however, to employ the old hands that would leave the union, and we managed to get the collieries into pretty nearly full work about the end of the strike. Then a great many of the union men, seeing that there was no chance, came in. The others hung about the works for weeks, some of them emigrated, and some of them got work elsewhere. The effect of the strike on the tradesmen of the district was most disastrous, many of them failed afterwards, and there were a great many women and children about begging, and a great many families were reduced to destitution; as I said before the coal and coke trade of our collieries was thrown into a very disorganized state, in fact almost completely destroyed.

11,855. (*Mr. Roebuck.*) What has been the state of things since?—This led to the dissolution of the union in the district altogether. They found that they could not beat us, whom they took first. During the time of the struggle with us, the other collieries in the district were at work, and a levy was made on the men working of so much a head to support the men on strike.

11,856. (*Lord Elcho.*) To how much did that levy amount?—From 2*s.* to 3*s.* a fortnight, I believe 10 per cent. on the wages of the men at work in the district round. These men got tired of supporting the men on strike, they saw that we were getting the

better of them. They found how far wrong the delegates were leading them, and they gave up the union in a great many cases.

11,857. Where did those delegates come from?—One of them came from Yorkshire.

11,858. Do you know from what colliery?—I cannot tell, but I can tell the names of two of the men. There was a man from Northumberland called Sheldon.

11,859. Do you know from what colliery he came?—I cannot tell.

11,860. Do you know what part of the county he came from?—From the coalfield of Northumberland, and the other man was called Thompson—Thompson and Sheldon were the two principal leaders; the trade of the district was seriously affected, the loss to the men in wages was calculated at 32,000*l.*, and the loss to the owners at 18,000*l.*

11,861. (*Mr. Roebuck.*) You say that the union was broken up; what was the result?—As soon as our collieries were pronounced non-union collieries, men flocked to them from all parts of the country; we had far more men applying for work than we needed. The men in the other collieries in the district, seeing the result of the strike on our works, saw clearly that they were being misled, and they gave it up too, and now I do not think that there is a single union man in the district.

11,862. (*Mr. Harrison.*) Did all the men in your colliery join the union?—All the coal hewers and all the coke men.

11,863. Did you get any evidence which connected these outrages and violence that you speak of with any determination come to by the union to take them, or with any order that was given?—The delegates were much too careful to allow anything of that kind, whatever they did they did in secret. The men carried those things out in such a way that we could never trace them to the source.

11,864. I suppose, as to the great crowd you speak of which there was at the eviction of these people from their houses, and when you were yourself assaulted, that was a crowd of men all over the neighbourhood?—They were our own men principally.

11,865. Do you mean that it was confined to those on strike?—There were a great many people from the neighbouring collieries, but the great bulk of them were our own men on strike.

11,866. (*Mr. Booth.*) You say that your men were assisted by weekly payments from men engaged in neighbouring collieries, were those collieries under the same union as your men were under?—Yes, under the same union.

11,867. (*Mr. Mathews.*) You state that you had very great difficulty in getting any legal evidence of the connexion between the union and these operations?—Very great.

11,868. But you have no doubt that all these proceedings originated in the unions?—Not the slightest; the reason why we could not get any positive evidence was, that when the union held their nightly meetings they kept closed doors, nobody was admitted except officials.

11,869. So that you have no legal proof, only moral proof?—Yes. We had nothing of the kind before the union was established.

11,870. (*Mr. Harrison.*) But then you were not evicting people from their houses before?—No.

11,871. (*Mr. Roebuck.*) Because I suppose they had not then done what you could complain of?—When they were turned out they had ceased work, and still they remained in our houses, which they had no right to do, as the houses were part of their wages.

11,872. (*Chairman.*) They had house and garden provided?—Yes.

11,873. (*Lord Elcho.*) What sort of garden, a quarter of an acre in extent?—Perhaps a tenth of an acre. Some of them do not take their gardens in at all; there are now many gardens lying waste that have not been cultivated for some time. There was something said about benefit societies. I may say that we have a provident society to which the men subscribe 6*d.* per fortnight, and we have an accident fund also.

11,874. (*Mr. Roebuck.*) Do they subscribe voluntarily?—Yes, voluntarily.

11,875. (*Mr. Harrison.*) You are treasurers, I suppose?—I am treasurer of the fund. It is managed entirely by the men, with the exception of myself, who am treasurer, and one of the clerks, who is secretary, and who makes the payments. We have also the "Miners' Permanent Relief Fund" established on the works. It is an accident fund; the men subscribe 7*d.* a month, and their families are entitled to assistance in case of death by accident—the widow to 5*s.* a week for herself, and so much per week for each child.

11,876. (*Mr. Roebuck.*) For how long?—As long as she remains a widow.

11,877. And the children, I suppose, until they are grown up?—Until they are 14 years of age.

11,878. (*Chairman.*) Who settles the allowance; so long as the man is out of work is it so much per week?—On the sick fund, as long as the man is out of work he is allowed 8*s.* per week; in the case of any man meeting with an accident, we allow him 5*s.* a week from the colliery so long as he is out of work; and further, in the case of any man getting killed on the works, his widow is allowed to remain in the house on the works as long as she lives, and have her house and garden free.

11,879. (*Sir D. Gooch.*) Is there any obligation on the men to join that fund?—Not the slightest.

11,880. How many do not join?—Probably about 40 per cent., they are so careless in providing for the future.

11,881. (*Mr. Roebuck.*) They are unmarried men I suppose?—Yes, unmarried men do not join. We further provide medical attendance for our colliers, which you may say is included in their wages, they have medical attendance for 3*d.* a week if they have families, and if unmarried men for 1½*d.* a week.

11,882. (*Earl of Lichfield.*) Do the proprietors contribute anything to those funds?—Yes, to the accident fund they contribute 20 per cent. of whatever is contributed by the men.

11,883. (*Mr. Roebuck.*) Do the men pay anything for their drugs?—Nothing at all.

11,884. How are they found?—We keep off each man with a family for 6*d.* per fortnight, that is handed over to the medical man, and he finds the family attendance, with drugs and everything.

11,885. (*Mr. Booth.*) Those that do not subscribe are not attended?—No, but we make it one of the terms of our hiring that the men do all subscribe to the doctor, because if they do not do so they are not able to pay their bill very probably, and then the surgeon has to attend them for nothing.

11,886. (*Chairman.*) And early attendance would very often prevent a long illness?—Yes. With all those advantages I think that our men are, I will not say the best paid, but as well paid as any in the county of Durham or Northumberland.

11,887. How much are the average wages at this time, when they are free to work as they like?—They are making from 5*s.* 6*d.* to 6*s.* and 7*s.* and 8*s.* a day, but the average wages of a good man are 5*s.* to 5*s.* 6*d*

11,888. (*Mr. Mathews.*) For which he does a certain amount of work?—Yes.

11,889. How many hours do the men work?—About 6½ hours on the average.

11,890. And if a man chooses to do more work he can, I suppose?—Yes.

11,891. (*Chairman.*) Is the sanitary condition of the men satisfactory?—Yes.

11,892. (*Mr. Mathews.*) What is the depth of your collieries?—Our collieries are not deep; the deepest of them are not above 70 fathoms, and we have a greater number of old men working more than you will find in deeper collieries and more fiery mines.

11,893. (*Mr. Mathews.*) To what age do the men

Mr. W. O. Wood.

17 March 1868.

work as hewers?—Till about 55; then we give them what we call shift work.

11,894. Till what age do they work at that shift work?—We have them up to 65 or 70.

11,895. And you find things go on well without unions?—Yes, very much better without them.

11,896. (*Mr. Roebuck.*) In fact you have got rid of trades unions altogether?—Yes. Prices have risen 10 per cent. since trades unions have been broken up, owing to the improved trade in the district, but lately there has been a depression.

11,897. (*Mr. Harrison.*) When you say "prices," do you mean prices to the public, or the prices of labour?—As soon as the prices of coal increase we raise the wages, because we find that if we do not pay men as well or better than our neighbours we lose them.

11,898. With regard to the hours of labour, you say that the men work 6½ hours?—The men are in the pit about eight hours, but they only work about 6½ hours.

11,899. (*Mr. Booth.*) But that is optional, they can work longer if they please?—Yes.

11,900. What are the hours of the boys?—The boys are down the pit on an average 12 hours.

11,901. (*Mr. Roebuck.*) You employ the boys longer than the men?—Yes.

The witness handed in the following papers:—

HANDBILL circulated by WORKMEN during the strike.

CAUTION.

Upwards of 1,200 workmen are out of employment at the collieries belonging to Messrs. Straker and Love, at Brancepeth, Brandon, Oakenshaw, and Sunnybrow.

We respectfully appeal to the public for support in our present struggle. We have been labouring under an inhuman system of "rocking" the tubs, in order to make them carry more coal to bank. Such a system is not known elsewhere in the coal trade, and we are compelled to resort to the present unpleasant means for redress. The coke burners employed by Messrs. Straker and Love have been paid less for their work than other coke burners in the same district.

HANDBILL, in reply to the above, circulated by the EMPLOYERS.

TO THE PUBLIC.

A bill having been presented to me, stating that the number of men on strike at the collieries of Messrs. Straker and Love is 1,200, I beg to inform the public that this is a great exaggeration. The statement that the coke burners are underpaid on these collieries is an untruth, and this is the first time that I have heard it; and when these men applied for an advance they never made such a statement.

As to the complaint of the rocking of the tub, this is got up for a purpose. There can be no grievance in the mode of working if a man is well paid for his labour; and it is a well-known fact that the pitmen on the collieries have been in the receipt of higher wages than any colliery in the neighbourhood, and this the men themselves admit. Where, then, can there be a grievance? To meet this complaint, the standard weight has been reduced six stones below the weight that we have worked these collieries at for 20 years, making a fine impossible without design; and we now offer to pay by weight instead of measure.

But the real secret of the conflict is whether the regulations of the colliery are to be carried out by the owners or the union committee; the latter is impossible.

(Signed) JOSEPH LOVE.

The witness withdrew.

Mr. J. T. Woodhouse.

Mr. JOHN THOMAS WOODHOUSE examined.

11,902. (*Chairman.*) You are connected with collieries in Derbyshire to a considerable extent, I believe?—Yes.

11,903. Are you managing director or proprietor?—I am not a proprietor. My occupation is that of a colliery viewer, and I am engaged principally in the scientific arrangement of collieries; and in some collieries as the authorized agent and manager, particularly in some collieries in South Derbyshire to which I would respectfully beg bye-and-bye to call the attention of the Commission.

11,904. In the course of your management have you had occasion to notice the action of trades unions upon the workmen employed in the collieries?—I have had occasion in many instances to notice them as an observer, but I have only had personal practical experience, coming into collision, as it were, with trades unions on two occasions. The last occasion is the present dispute that, I understand, is just terminated in South Derbyshire; and the other was a dispute in the same district in the year 1842, when a similar occurrence took place.

11,905. What was the origin and progress of the strike in 1842?—In 1842 wages were very much lower than they are now in that district of South Derbyshire. I may perhaps here state that I have heard Mr. Markham's evidence this morning, in which he quotes Leicestershire. It is not Leicestershire that he meant but South Derbyshire. The coal fields run out of one county into the other; but the part where the dispute is immediately going on is in South Derbyshire, and not in Leicestershire at all.

11,906. (*Mr. Harrison.*) Is that at Church Gresley?—I am the principal agent at Church Gresley. In 1842, about the time when the Chartist agitation was started, a dispute occurred which was mixed up altogether with a rise in wages, and the people's charter as it was called, and beer. It was the custom in South Derbyshire, as it was for many years, and, I believe, now is in Staffordshire, to have beer supplied for the working men. This beer was not sent down into the pits, but was kept in stores on the pit's bank, and we found that it had a very prejudicial effect in this way: When the men came out of the pit hot and thirsty, they naturally went to the store and had some beer; that had the effect instead of doing them any good of sending them off to the public house, and they became more and more thirsty, and there were lots of instances of persons never going to their homes at all, but stopping fuddling all day and night in public houses and coming to work at the collieries the next morning, that we determined to put a stop to it. It was a concurrence of the circumstances which I have mentioned that resulted in a strike. I think it lasted two or three months. Trade was at the same time very bad indeed, and there was a great disturbance at that time all over England and North Staffordshire; but ultimately the thing subsided, and after a certain period trade became better. Wages have gradually risen to be pretty nearly double what they were then, and we have had no strike or any disturbance whatever in that district since that time until February of last year. In February of last year one William Brown came down into South Derbyshire and began to lecture, and got on from one thing to another, and tried to induce the men to join the miners' union. Things have gone on from bad to worse, until, I believe, that now from the last report I had, the thing has come utterly to a collapse. The union people had been paying men that were out of work at the rate of 7*s.* a week. That suddenly went down to 4*s.* a week, and now it is stopped altogether, I am told. There are a great many people out of employment; I may say some hundreds. The trade of the district was lost for the winter, and the collieries were losing money. It was altogether a bad state of things. There were innumerable acts of violence, smashing windows and beating people and intimidation, all of which I or my agent will be prepared to show in detail, and this has entirely arisen from the action of the union people. There was not a single complaint of any kind previously. I did not take any notice of it at the time that it took place, but I sent for two or three men from the Granville colliery, and I said, "What is it you men have to complain of? I have "been agent for more than 30 years, and I have never

" refused to attend to any working men; everybody is " open to come to me. If he has a complaint to make, " or anything is wrong, pray let me know in order " that I may put it right." I could of course get no answer. The people were dumb, and the men went away, and I could make nothing of it, and we have been forced to wait patiently for the development of it. Some of the coalowners have taken some trouble to import fresh hands.

11,906. I have set on a few fresh hands at Church Gresley, but not many, and they are remaining at work, but on the whole I thought it better to wait with patience until the thing was over, and then, perhaps, our people would come to their senses again, and would find we were their best friends, and that we should go on better hereafter. However, that was the state of things.

11,907. (*Mr. Roebuck.*) How do you connect this generally with trades' unions?—In this way; that this man Brown is, I was informed, (a great deal of this must not be regarded positive evidence in a strict point of view) is from South Yorkshire where the miners' union is in force now.

11,908. What is he?—He began by preaching, and took a building called the Peoples' Hall, which has been erected on the common at Church Gresley for sundry purposes. First of all it was, I believe, intended for an institution for educating workpeople. A philanthropic individual in our neighbourhood, I believe, was instrumental in having it built. By-and-by it fell into the hands of the Primitive Methodists, I am told, and from them the union party has been hiring it, and has been using it for a place for assembly. It has been the focus of the whole thing?

11,909. When you say "preaching," do you mean religious preaching?—*Quasi* religion, giving out a text and shouting from it.

11,909. How do you connect this preaching with what followed?—I connect this preaching with what followed by his advice to the working classes then and there attending to join the miners union with the view of working shorter hours, with less weight, more money, and so on.

11,910. Did the men follow his advice?—Many of them did.

11,911. What was the result of it; what did the men do?—The men became insubordinate and unmanageable altogether; not subject to rules, and as soon as we discovered that that was so, as far as I was personally concerned, I gave instructions to have them discharged.

11,913. And were they discharged?—Yes.

11,914. What followed upon that?—This went on, a good number remained, and after a time a good deal of intimidation went on.

11,915. When you say that can you give specific instances?—I will take care that the Commission have all the specific instances. I am sorry to say I cannot do it now. From the nature of my occupation and the short notice I received I am not prepared to do it now, but if the Commission will permit me I will read a statement which one of my own people has made out of what has taken place at the Church Gresley colliery, which at a subsequent meeting of the Commission he will be prepared to substantiate. This man's name is Robert Walters; he is the agent at the colliery and acting under myself. Some fortnight ago I said to him, " I have had an intimation that I am to be exam- " ined before the Trades Unions Commission. South " Derbyshire will be mentioned and you had better " state what you can afterwards substantiate as to the " proceedings of this strike." I said " Do not put down any more than is true or any less." I will produce the man so that the Commission shall have the opportunity of testing the value of what he says. This is dated " Church Gresley colliery, 10 March " 1868. In the beginning of February 1867, William " Brown, one Lee, and others came to Gresley and " commenced holding meetings, for the purpose of " forming a colliers' union. They had some very " strong meetings, making use of very abusive lan- " guage towards the masters and their agents, and " enticing the men away by telling them they were " badly treated, and that they must therefore join the " union, so as to insist upon getting 8*s.* per day for a " day of eight hours, whether they were filling bond, " dirt, (that is rubbish) or coals. These fine promises " so acted upon the men that they began to join the " union in large numbers, and they became so inde- " pendent and ungovernable that we could not keep " them in their places, nor could we tolerate their " abuse of the deputies, so we resolved to turn out all " those that did join the union and became so abusive, " and on the 30th March 1867 we gave notice to four " men (being all we knew of at that time), and on the " 13th April to 14 more. Meanwhile the men in the " union became more abusive every day, and began to " follow the men and boys that were at work from " their daily labour, both morning and night, groaning " at and abusing them, rattling cans, blowing cows " horns, tin horns, and other instruments of a noisy " nature, till it was not safe to travel on the roads; " so we applied for an extra force of police to guard " the men and boys at work. On the 27th April we " gave notice to 20 more men that had joined the " union, (matters going on worse than ever, and the " men becoming more and more abusive, particularly " after they had held a meeting,) on the 11th May to " 13 more, on the 25th May to 4, on the 8th June to " 5 more, on the 22nd June to 10 more, on the 6th " July to one more; on the 20th July to ten more; " and on the 26th October to two more, being the " last men discharged, numbering in all 83 men dis- " charged. The abuse of the unionists became worse " and worse, and about 100 to 150 men, women, and " children, constantly followed those at work, dinning " them with the above-mentioned instruments, and " they now began breaking the windows of the non- " unionists, and rewards were over and over again " offered for the apprehension of the offenders. But " these continued annoyances at length so dis- " gusted and frightened the men at work that they " dare not come, and 94 of them, men and boys were " obliged to give notice in order to obtain peace and " quietness; but before their notice had expired, we " got a large force of police (and the men seeing there " was more protection for them) 55 of them withdrew " their notices and resumed work, but the unionists " still meaning to stop the colliers, began to meet by " pickets in the night, and throw stones at the men. " Some of them were however caught, and nine got " sent to gaol for different terms of imprisonment; " after which we got quiet for a time, but soon began " again as bad as ever, picketing and stoning, and " beating three men so dreadfully that their lives were " despaired of. Breaking windows was again in vogue " and their meetings were held every other night " nearly, instead of once a week as before, the bellman " going round and giving notice that there would be a " meeting at such a time, and insiting" (this is the phraseology) "all miners 'Blacklegs, Funny Eyes, and " Bloodsuckers' to attend, with lots of other names " not fit for publication. They then became so bad " that we were obliged to get a large van to take the " Overseale and Linton boys home in" (those are vil- " lages near at hand) "but we found we dare not " start, for there were hundreds of men armed with " long sticks, and for ought we knew, with pockets " full of stones, lining the roads for three-quarters of " a mile, and the horses alarmed by the noise of horns, " &c., began to fly about and shy, so we were com- " pelled to give it up as a bad job, and to get the men " and boys home as well as we could, but not without " great trouble and abuse from the mob, and if the " police had not worked with great tact and caution " as well as patience, we must have had a very serious " collision, but they forbore all interference with the " mob. By this time they have succeeded in reduc- " ing the coal turning" (that is drawing) from 4,614 " tons per fortnight to 1,330 tons, for the men at work " could not make full time, for unless they could meet " with the police in the morning they dare not come

Mr. J. T. Woodhouse.

17 March 1868.

"by themselves, therefore we did not get full work out "of those who were loyal and wished to work. Then "we had the grand processions with two bands of "music disturbing the whole of the peaceable inhabi- "tants in the village, and yet still failing to accom- "plish their designs, tea meetings with great show "and pomp were tried, and the people (unionists) got "to such a pitch of excitement, that they were ready "for mischief at once. One-half of those assembled "were potters and clay getters." I may ex- plain that this is in the midst of an earthenware district, "who were as abusive as the rest, for "they were glad to get anyone to swell the mob "so as to show the country the 900 spoken of in the "papers." It was alleged by Brown that there were 900 men in pay from the funds of the union, and some people doubted whether all the money that was sub- scribed in other districts were spent judiciously or not, and it was hinted that money went the wrong way into people's pockets where it was not intended to go, and so it was done to substantiate that, "With "all these losses, &c., we have weathered through "the 12 months, and now do not let the police attend "their meetings." This was written in March. I have heard as I have told the Commission before that within a few days the thing has collapsed, and now a great deal of rioting is going on breaking windows, and so on. The unfortunate people who are out say that they will as soon go to prison as starve outside the prison, and I have no doubt the end of it will be a most lamentable state of affairs; there can be no question of it.

11,916. (*Mr. Harrison.*) There was some common action taken, some conceit, was there not, in the be- ginning of this affair between the employers in that district?—Yes, in South Derbyshire.

11,917. Were they members of an actual associa- tion, ironmasters, or coalowners?—No, we have had a kind of quasi association, I may call it, but never any well organised one. After this commenced the proprietors and agents of seven collieries, I think (but there is a gentleman in this room who will give a list of them) of those collieries, met, as they naturally would, to see what action should be taken in this emergency.

11,918. When was that—was it after Brown came down?—Yes after Brown came down—not till then.

11,919. A resolution was passed at a meeting at which these employers were represented or were pre- sent that in case any union should be started in the district the men should be locked out, was that it?—Very likely. I do not recollect that resolution.

11,920. The action taken upon the appearance of Mr. Brown was a resolution that if the purpose were carried out it should be put down by this association between the employers?—It should be resisted.

11,921. But a formal resolution to that effect was passed; I have seen it in print?—I have not seen it in print. I do not think that a single resolu- tion come to in South Derbyshire has been printed.

11,922. You may not know what has been printed. I did not say that I had seen it in a newspaper?—I am not aware that it was printed.

11,923. But an understanding was come to between the particular employers that you have been speaking of in the immediate Church Gresley district (I think you mentioned seven), that the attempt to form a union should be resisted by locking out the men who joined it?—That we would not employ the union men.

11,924. That was before the union was actually founded, was it not?—No, in fact, the union was never founded at all; there has simply been a series of efforts to form a union which have failed; there has been no union there formed. These people, Brown, and the others, have attended to endeavour to form a union, but they have not formed a union.

11,925. But an understanding was come to in February, was there not, that if the men were to join or attempt to form a union they should be locked out?—I think that was after February, but I cannot tax my memory.

11,926. That is to say this—a union of employers met together and decided that if the employed united themselves in union there should be a general lock- out?—No; instruction was given of the intention of the men to form a union before the masters met, not afterwards.

11,927. What notice?—Notice by the people who preached that they were going to form a union. Upon hearing that we then determined that we would not employ union men. We did not say that they might not form a union.

11,928. Having been in association some time pre- viously?—No. I say there was no association in South Derbyshire until after this Brown began to preach.

11,929. But upon the appearance of Brown, who came from Yorkshire, you associated yourselves, and decided that if the men did the same thing you would lock them out?—The fact was we suspected that it was the Yorkshire game over again.

11,930. (*Sir D. Gooch.*) It was not a lock-out in the usual sense of a lock-out, but you would not employ unionists?—Just so. We did not lock out the men. The very first pay day after, I said "Any man choosing to leave the union can come back."

11,931. (*Mr. Harrison.*) You previously closed the works, did you not?—Never, our works have never been closed.

11,932. When Brown came down and the men got so insubordinate as you say, what did they do?—They did that in the pit which is obstructive of labour. They were saucy, impudent, and disobedient. And there is no place where it is so easy as to be dis- obedient as a coal mine; and unless we could carry on the pits with decent discipline we knew that they could not be carried on at all: agents cannot be insulted, we know that.

11,933. Did you dismiss any men from any other cause except that of actual personal insubordination or bad language?—I have dismissed men lots of times.

11,934. I mean during this affair in March. You say that in March you dismissed a certain number of men. Were those men dismissed for separate offences or because you ascertained they had joined the union, or were at the point of doing so?—The number I have described in reading that paper were dismissed because they joined the union, but other men may have been dismissed for offences against the pit regu- lations. I will not say as to that, but they are not mentioned in that paper.

11,935. The associated employers bound themselves not to give employment to the men who were so dismissed?—There was no binding at all.

11,936. Was not that an understanding?—Cer- tainly.

11,637. And that understanding was come to before March, was it not, before the time when the men were actually dismissed?—I cannot say; I do not remem- ber the dates.

11,938. You have no doubt, have you, that the common action resolved upon was a prospective one, that is to say, if the men did carry out this intention, that should be done?—No, it was not prospective, but retrospective, inasmuch as some of the men would carry out this purpose of theirs.

11,939. (*Mr. Roebuck.*) It was after Brown came down that the men said that they would do certain things, and you said that if they did those things you would turn them out?—Yes.

11,940. (*Mr. Harrison.*) Can you speak to the date at which any union was formed in the Church Gresley district?—No.

11,941. You cannot say that your resolution or action was taken after or before?—Yes, I am certain that our action was taken after Brown began to preach. They began a lodge or whatever they called it. I do not believe that there was one man in any capacity in our district who was an officer excepting he was from a distance, either Brown as a preacher, or Lee as another preacher, or some of these people going about in an itinerant manner making disturbances.

11,942. What were the men dismissed for?—For joining the party.

11,943. I understood from your last answer, that there were no members of an actual union there, except Brown and some of the foreign men, that is to say, strangers to the district?—I was proceeding to explain that, I do not know that any of our men became agents of this union; they joined the union, but not as officers of it.

11,944. You dismissed the men on the ground of their becoming members of it?—We knew perfectly well that if the union were established in the same way that it is in Yorkshire, it would be impossible to carry on the works.

11,945. Why?—Because we should have had no influence or control over the workmen.

11,946. How do they carry on the works in Yorkshire?—On this point, to a certain extent, I cannot give you positive evidence, because, though I have been a good deal in Yorkshire and engaged in the Yorkshire collieries, I have not had to do with the control of the men directly. I see, however, what is going on. I see in Yorkshire that they are associated in this union, that they take their action from the direction of the union officers, whoever they are, that they work and play just as they please, that they work just what hours they please, and how they please. I see that, though I do not participate in the management of the men there at all, and I know, that being so, that we could not in our part of the country carry on the work at all to advantage on that plan, but that it would be a complete shut-up.

11,947. You mean to say that all works in Yorkshire, where unionism prevails as strongly as you say, cannot be carried on with advantage?—I have a very great doubt about the union existing very long in Yorkshire, and for this reason: the Yorkshire union has been established during a period of rapidly improving trade, arising from the state of trade generally; arising from the development of the coal traffic by railways, and arising also from the export of coal. That has created a very great demand, indeed, for labour in Yorkshire. Then, too, the Yorkshire seams are very easily wrought, and I believe that wages have got up to a high rate in Yorkshire. All that has been favourable for the union, but now wages will be lowered—must be lowered—for the people cannot work the collieries. They are now working short time at many of the places, and I believe it will have the effect of causing the union there to cease; unions cannot live in very bad times on the gigantic scale on which these miners' unions have been carried on, you could not find funds for them.

11,948. (*Mr. Roebuck.*) When you said that you could not work Derbyshire mines after the system adopted in Yorkshire, I suppose you meant that they work them badly in Yorkshire, which you would not do?—I mean this, that in Yorkshire the seams are easier worked as regards manual labour, that the machinery is more powerful, and that they are more capable of making a large output of coal in a given time than we are. They have erected very powerful machinery, and can put out a large quantity of coal in a very short time. They have an advantage over those districts that are working in the more old-fashioned way. What they do in 3 days in the week takes us something like 5½ or 6 days to do.

11,949. And you think that those collieries that have those peculiar advantages can bear with and support greater interruptions than you can do?—Yes.

11,950. And the interruptions with which you were threatened frightened you so much that you took these precautions to prevent their interference with you?—That is one reason.

11,951. (*Mr. Harrison.*) Will you give specific examples of the interruption to labour which you have observed in Yorkshire for instance?—I do not exercise any control over the men in Yorkshire. Please to understand my business is a totally different matter altogether. But I heard that at one of the collieries one morning, the men were all laid off work, and the pit ceased to work, and when the manager sent up to Barnsley to the union authorities to know what was amiss, the answer was that there were too many men employed in the pit, and that there must be a less number, and it ended in those men being turned out.

11,952. Could you give me the date of that?—No, not exactly.

11,953. What year was it?—Last year.

11,954. Do you say that you believe the secretary of the South Yorkshire Miners Association in Barnsley sent that answer?—No, I do not say that; I said the authorities. I do not know who the secretary is in Barnsley.

11,955. You say that the authorities justified the calling of a body of men out of the pit on the ground that there were too many men in it?—Yes, so I was told. I hope the Commission will enquire very strongly indeed into the working of the union in South Yorkshire, it will be exceedingly instructive, I think.

11,956. We want to know what your experience of it has been?—Unfortunately, as regards South Yorkshire, I cannot give you legal evidence.

11,957. You have taken of course a very serious step involving serious consequences to a number of people in carrying on a struggle for a year to resist the introduction of this system of unionism, and I presume you have done that upon very good experience of what its consequences are. Now I ask what within your experience and knowledge are the specific fruits of that system?—In the beginning of the examination I told you that in our own neighbourhood I had not come into conflict, if I may so term it, with the unionists, excepting in the year 1842, and last year, so that my own experience in dealing with these questions is limited, and is confined simply to that of an observer. What I have seen in other places is principally in Yorkshire, and in regard to Yorkshire, I merely gave you an instance of what I had been told. I cannot give that as evidence; I do not know the facts.

11,958. (*Lord Elcho.*) You are a civil engineer, are you not?—Yes.

11,959. Are you consulting engineer of the Oaks Colliery?—Yes.

11,960. Were you the consulting engineer of the Oaks Colliery at the time of the accident?—Yes.

11,961. Had you been so for a long time previous to the accident?—Several years; and my duties were confined entirely to the ventilation and management of the pit. I am consulting engineer there now.

11,962. (*Mr. Roebuck.*) As to that strike of 1842, what were the circumstances immediately preceding that strike; was one of them the coming down of this man Brown to lecture?—Not in 1842. In 1842 the strike arose in the first instance from political agitation, but it happened to be mixed up concurrently with a desire to have wages raised, and with the beer question which I describe.

11,963. When was the strike occasioned by Brown coming down?—Last year.

11,964. Now let me direct your attention to 1867. Brown came down, you say. What was the state of things before he came down?—The state of things was perfect repose; we had no dispute whatever; amongst the men there was no difference of opinion. We had a very good trade, and the whole country was in perfect peace, and we made from time to time alterations, and advanced wages as we found wages advancing in the country. There was no necessity for a union to have wages advanced, for the competition for labour in South Derbyshire was very great until this last strike took place, and we were going on improving gradually in every respect, and then this came. It is a matter now almost of history, but when I began life colliers used to work up to 9 o'clock at night for a day's work, and I have known scores of times when they worked up to 3 o'clock for half a day, and I was the man who made the greatest exertions to alter that state of things and to reduce the working hours, and we have been gradually through

Mr. J. T. Woodhouse.

17 March 1868.

that district reducing time, reducing labour, and getting everybody on to the best of our ability, and serving men in the best way that we could, and then this comes.

11,965. What I want to call your attention to, if you please, in order to meet Mr. Harrison's wish to know precisely the facts preceding your determination not to employ union men, is this: you say that before this man Brown came down there was perfect peace in your district, and that there was increasing prosperity and everything was going on well at that time and improving?—Yes.

11,966. Then he came down and he began to preach?—Yes.

11,967. Then I suppose your attention was called to him, and from him your attention was directed to South Yorkshire, or had been before directed to South Yorkshire, and you asked yourself what was the condition of South Yorkshire?—Yes.

11,968. Then you thought (I do not say why or wherefore) that the condition of South Yorkshire was a bad condition?—Yes.

11,969. And you were afraid that your pits and your business would be reduced to the condition of those in South Yorkshire if this man Brown went on with his proceedings?—Yes.

11,970. Thereupon you determined that you would not have anything to do with anybody that followed the directions and commands of this man Brown?—Yes.

11,971. And that led to your determination not to employ anybody connected with the union?—Yes.

11,972. (*Mr. Harrison.*) In the beginning of the year 1867, after Brown came down, did your men make a joint demand for a rise of wages?—No.

11,973. Did they make any other joint demand with regard to the working of the pit?—No.

11,974. Then there was no question between the men and yourselves, except the single question of unionism?—Not the slightest.

11,975. Which you thought a very grave question?—Yes.

11,976. You say that until Brown came down everything had been working well for a great number of years—that you had had no experience of unionism, and things had been in a very satisfactory condition?—Yes.

11,977. After Brown came down what was it you had to complain of, apart from this determination to form a union?—The first thing, as I have already told you, was the insubordinate state of those men in the pit.

11,978. Do you know that the belonging to a union or the formation of a union leads to personal insubordination of individual men, personal insolence.—Yes, I believe it does, and for this reason, that the union, and the doctrines they have taught, as I am told (for I never was at a union meeting) teach them an independence of action with their employers. It breaks entirely the old lines of good faith as between master and man, and they depend upon this union for counsel and advice, and assistance, and they lose all kindly feeling, and all the old lines are completely destroyed as between master and man, and it then comes down to a hard line, and from that moment all good feeling is lost. The master is soured, loses his temper, and will do nothing for his men. The men, on the other hand, go for consolation to the union delegates, or whoever they are, and it ends in a strike. It ended so in South Nottinghamshire. They were out three months in South Nottinghamshire, at Hucknall Torkard, immediately before this came out.

11,979. But I want to confine you to this particular case; I want to know whether you can show me what connection there was between unionism and this personal insubordination and insolence of the men in the pit. After going on for 20 years, as you say in perfect harmony, the men in the pit began to abuse the foremen and managers, and so on, and refused to obey orders. I say, can you in any instance connect such acts of insubordination and personal violence with any resolution that was come to by the union, or with any direction of union officials?—I can only say that the men who joined the union were the men who were insubordinate, but I do not think that I could adduce a single instance of the men carrying out the instructions of the delegates to be insubordinate, because they take very great care not to give such instructions.

11,980. There was no specific rule of the union which the men began to adopt which led to the particular matter for which they were dismissed?—I do not know what the rules of the union are—I never saw them.

11,981. Then beyond your belief that the men were at the same time members of the union or had just begun to be members of the union, and the foremen alleging that they were insubordinate, you have no direct connexion between the two things—that was the sole connexion?—Yes, my information was from my foremen.

11,982. Do not you think that, supposing that the associated employers had resolved to suppress the introduction of unionism by dismissing men who should belong to the union, the foremen and managers who were well aware of that determination of yours would be rather ready to find some grounds for speaking of the men whom they knew to be unionists as insubordinate?—I must in this case speak for myself, not for the other agents, and I say that in my case certainly they would not.

11,983.—Did you investigate some special cases of insubordination?—I merely inquired as to whether insubordination did exist.

11,984. What was the special form of it?—Disobedience of orders. I cannot give you the specific cases. I place confidence in my people, and they report to me, for instance, work being badly done. It is a very common complaint, for example, in mines that the works are not properly timbered, and if they are not properly timbered accidents occur, and perhaps loss of life, and then we get censured, and very properly, for it. But when there is no subordination we have no security that the works will be properly timbered, for so reckless are men (particularly if there is a little temper mixed up with it), that often they will not set the short props under the coal in the mines, and will not set the props in the faces. That is a matter where subordination is of the utmost consequence; the same is the case in regard to ventilation, in regard to the doors, and also in regard to our engine-wrights. If a man in a pit merely obeys his orders with eye-service, and does not seek to do his work well, he is worse than if he did not do it at all. I am as strict a disciplinarian as I know how to be, and if I saw a danger of that sort of thing arising, my duty would be to stop it at any cost, and you cannot stop it with men imbued with the principle of insubordination.

11,985. Did you come upon such cases?—I believed I did.

11,986. You investigated the cases of men who had neglected their work?—I investigated the cases. I found the men were in a state of insubordination. I found that it would rapidly increase, and I would not employ them.

11,987. Is not that equivalent to saying that you dismissed the men for belonging to the union and not for anything else?—The only men that were insubordinate were union men.

11,988. (*Mr. Roebuck.*) Before Mr. Brown came down you say there was perfect harmony and good conduct on the part of the men?—Yes.

11,989. When Mr. Brown came down he preached, and he preached disobedience?—I do not say that.

11,990. What did he preach?—I cannot tell you what he preached; I did not hear him. He took a text and preached the same as itinerant preachers do, but in so doing I have no doubt he appealed to their feelings, and working people are very excitable, and when their feelings were up they would say, "Let us join the union."

11,991. He preached, and after his preaching you found disobedience?—Yes.

11,992. You say that for so many years there had been perfect obedience, there came this remarkable circumstance of the preaching of Mr. Brown, and then disobedience followed?—Yes.

11,993. Therefore you connect the two things?—Yes.

11,994. (*Mr. Booth.*) From what you knew of the way in which the works were carried on in Yorkshire under the influence of unions you felt that it would not be worth your while to carry on your business under those terms?—I did.

11,995. And therefore you determined to have nothing to do with unions?—Yes.

11,996. (*Mr. Harrison.*) Do you know that the discipline and personal conduct of the individual miners in the mines in South Yorkshire is bad?—I have seen it very bad indeed.

11,997. I mean as a rule, is it worse than it is in other districts?—I cannot say that.

11,998. Do you mean that a man there neglects the shoring up of the roof and otherwise neglects his duty?—I know that there has been and is a vast deal of neglect in South Yorkshire, but I cannot give you particular cases.

11,999. You inspect certain coal mines in South Yorkshire?—Very few.

12,000. The Oaks Colliery is in South Yorkshire?—Yes.

12,001. From your experience of those mines down which you go to carry out your periodical inspections, do you feel that the South Yorkshire miner is less obedient, less prudent, and less careful in his daily work than the men in your own district?—Yes; and let me add less amenable to control.

12,002. And less skilful?—I do not say less skilful; they are clever enough if they will only do as they are told, but they are not amenable to control; that Oaks colliery of which I am the inspector and which Lord Elcho has mentioned and which for so many years I have known is a case in point. At the time I commenced at the Oaks colliery there was not a shadow of discipline; they used the safety lamps just as they pleased. We have not a perfect lamp yet, but a safety lamp to be a safety lamp must be constructed in a certain way. If, however, the lamp did not give as much light as they wanted they would not use it, but would send to Wakefield, where these things are made and have another sort of lamp. There did not seem at that time to be any idea of discipline whatever. I endeavoured to introduce it as far as I could, but the task was so unpleasant that I simply confined myself to the care and safety of the works without regard to the ordinary discipline.

12,003. Has your experience been that unionism amongst the miners tends to greater recklessness?—Yes, I think so. It tends to the utter subversion of the necessary discipline in a pit.

12,004. What resolution or rule have you ever heard as existing in any union in the country the tendency of which is to check proper care?—I have said already that I do not know the rules of the unions.

12,005. Then you do not connect it at all with unionism?—I only say that these men who are in the unions are very insubordinate.

12,006. That is from your personal experience?—No, I say that I do not control any persons in Yorkshire at all.

12,007. It merely comes to this, that you have formed, like other members of the community, an opinion upon this question of trade unionism or non-unionism, and speaking generally you say you know what would arise if it were introduced?—I know what would have arisen if it had been introduced in South Derbyshire.

12,008. You can form an opinion like any one else in fact?—I am a responsible agent, and I have to form an opinion from long practice, and my experience was that to allow a union to be established and to have our pit under the control of strangers could not be tolerated. In addition to that it destroys all our old associations with our work people. Our work people have lived there for years and years, and we have always been on the most friendly terms with them.

12,009. (*Mr. Mathews.*) With regard to your experience—I have known you myself for many years, and from a very early period of your life. I think you have been engaged in mining occupations and mining supervisions from a very young man?—Yes, I began on my own account in the year 1831, and I have been engaged in mining ever since, and I have done nothing else. I was articled to a mining engineer in the year 1827, and then started on my own account in 1831.

12,010. Have you had any supervision of mines in North Staffordshire?—Yes.

12,011. In South Staffordshire?—Yes.

12,012. And in Warwickshire, Derbyshire, Leicestershire, South Yorkshire, and Nottinghamshire?—Yes. Of late years I have endeavoured to contract my practical government of these people, as I am not quite so young as I was, and to confine myself more to the scientific detail.

12,013. In addition to these sources of gaining information and experience are you a member of the Coal Commission?—Yes.

12,014. With all these extensive spheres of supervision that you have had the opportunity of exercising you of course have come in contact a great deal with the workmen?—Constantly.

12,015. With their habits and associations, their communications with their masters, and their communication with their fellow-workmen, and that has given you an opportunity of estimating the force of these unions you speak of?—Yes.

12,016. You have come to the conclusion from these sources of experience, that whenever the workmen combine to form a union they listen more attentively and more implicitly to the suggestions and advice of the leaders of the union than to those of their masters?—Yes, uniformly they do. There are a few exceptions, where they will not join at all, but it is the uniform natural tendency, and when people are told day after day of the very great advantages of forming a union, they naturally fall into the mistake, particularly when their sympathy is excited by pretty tales of sufferings and hard doings, and so on.

12,017. But in all collieries such as those that you have under your supervision, strict discipline and adherence to details is of great importance both for the men's interests and the working of the collieries?—Yes.

12,018. And you have found that when they listen to the dictates of the unions the discipline of the collieries is relaxed?—Immediately.

12,019. (*Mr. Harrison.*) I understood you to say that you had had no experience of unions?—I said that in South Derbyshire we had had no experience of strikes except in 1842 and 1867.

12,020. I thought I asked you what personal practical experience you had had of unionism, producing insubordination amongst the men in the works, and I thought you said that you did not know much about it?—I think that I instanced South Yorkshire, where I said that I had observed such and such to be the effects of unionism, but I had not the control of persons in South Yorkshire.

12,021. (*Mr. Mathews.*) With this experience before you, you came to the conclusion that the conduct of a large colliery is better carried on under the control of the masters than it is under the control of the union leaders?—Most certainly.

12,022. And with that impression you have always set your face against the introduction of the rules of the union to supersede those of the employers?—I have not seen the rules, but I have set my face against the union being the authorized parties to manage my affairs.

Mr. J. T. Woodhouse.

17 March 1868.

12,023. You have not seen the rules, but you know the general practice from your experience?—Yes.

12,024. Under those circumstances you thought it necessary to advise your principals (and as far as your present interest has gone you have followed the same course yourself) to employ men who do not belong to unions rather than those who do?—Yes.

12,025. And you think masters should be at perfect liberty to exercise that discretion?—Yes.

12,026. And you think on the whole that the unions have been mischievous to the general conduct of the collieries, and to the interests of the masters?—Yes.

12,027. Do you think also that they have been equally mischievous to the interests of the men themselves?—I think so.

12,028. Where the relation between colliers and employers is reduced to one of mere abstract interest, do you think that the cordial, friendly, and christian relation that existed between them before the introduction of the unions has been weakened by their introduction?—I think so; and it is impossible to be otherwise. No matter how painstaking; no matter how worthy or considerate of his workmen a master may be, the moment that a foreign party—a party from the outside—comes in, who tells his workmen that they are oppressed, that masters are tyrants, who regard nothing but making their fortunes, and that they ought to be better paid, and work shorter hours, and be better taken care of, there naturally arises in the mind of the master a spirit of opposition.

12,029. (*Mr. Harrison.*) That is rather a fancy picture, is it not?—No, a hard practical picture.

12,030. From your own experience?—From my own experience.

12,031. (*Mr. Mathews.*) Does your experience, which is very extensive in regard to collieries, justify you in stating that unions have been disadvantageous to the interests both of the masters and of the workmen, and to the conduct of the collieries?—Yes, the moment a man is taught that he can have relief or assistance from any power outside his master, that moment that man becomes careless of his situation, and becomes a bad servant; that is the influence these things have. It is something like what Mr. Markham described when he said that the masters would withdraw their schools and clubs. The moment that good faith is broken between the masters and the men (and it is broken by these men who go about agitating), that moment the sympathy between the two is lost. There was an unfortunate man whom I knew, who died recently, who was sadly plagued by these unions. I was once his engineer. He had a union at his colliery, and I know that it has been one series of strikes and struggles. The union people have been there, first raising the wages, then lowering the wages, then quarrelling about one thing and then about another, until there is no sympathy left.

12,032. (*Chairman.*) Have you known masters oppressive, and then a check to them resulting in benefit to the working men?—I have known times when masters have acted injudiciously and indiscreetly and attempted reductions when it has been very undesirable to do so.

12,033. (*Mr. Mathews.*) Have you ever offered advice to the masters under those circumstances?—I have told them they were very simple, and had better leave the men alone. I said the men knew nothing about the policy of the trade, and you had better pay them and abide the loss. In some cases my advice has prevailed, and in some cases not. In the coal trade there is this peculiarity, especially in the midland counties, that a great many people have rushed into the trade without any knowledge of it except as a means of employing capital, and those are the class of men that generally make the mistakes.

12,034. (*Mr. Roebuck.*) But would you be surprised that men in the position of working men, when that conduct took place which you call unwise, simple, and so on, should say that their masters were tyrannical?—No, not at all.

12,035. That is their mode of expressing the same thing?—If a man oppressed me I should say he was tyrannical directly.

12,036. There is no fault to be found with the men in that case?—Not in that case.

12,037. (*Mr. Booth.*) Those are instances which would fall under the question, What are the circumstances which justify a reduction of wages?—Yes, it was want of experience in the matter. When those men I have spoken of came to understand the trade and the fluctuations of the trade, and the competition of men for labour, and so on, they settled down into a quieter system.

12,038. But there was no further oppression on the part of the masters than thinking that the men were not entitled to the wages they asked for?—Nothing whatever. I may say that I am a very great opponent of fluctuations in wages. I think it is a very bad policy. The wages have gradually increased in this country for many years, (I am speaking of coal mines) and I think it is better except we are driven into extremities to let the men earn their wages and keep them within bounds. I do not like reducing wages if I can avoid it.

12,039. (*Mr. Roebuck.*) Do you recollect the coming out of that Parliamentary Blue Book which contained drawings of people working in coal mines?—Yes, that was in the Children's Employment Commission. I myself gave evidence on that subject.

12,040. Do you not think that the masters were some of them, I do not say all of them, injudicious in their opposition to that movement?—Yes.

12,041. Would you complain of the men calling that tyranny?—No.

12,042. I want to know whether that insubordination of which you complain had not in some cases led to beneficial effects?—It may have led to beneficial effects in this way. I suppose that something or other led to the Children's Employment Commission. At that time there was a very grievous complaint indeed, but that of course does not exist now.

12,043. You see that insubordination has in some cases led to good?—It may have done so, but I do not admit that insubordination led to that Commission. I do not know that.

12,044. It was complaint that led to that Commission, and men of your way of feeling, said at that time that that complaint was insubordination?—I am rather inclined to think that that arose in great measure from the employment of females in Lancashire. When that Commission was opened, and they got at the root of the whole thing in Lancashire, then of course the inquiry was extended into other districts as far as Scotland.

12,045. My object in putting those questions was to show that there were complaints to be made of the masters as well as of the men, and that a great deal of the mischief has been produced by the shortcomings on both sides?—I daresay it has. I should not like to say that there was no fault in the masters.

12,046. (*Mr. Mathews.*) Was it any complaint on the part of the men that was the cause of that Commission?—I do not know what was the cause of that Commission, but I may say that it has occurred to me that it was through the exertions of a noble lord who has done a great deal for the working classes that it originated in Lancashire.

12,047. The employment of women in coal mines had been for a long time the custom in Lancashire?—Yes, it had been.

12,048. And it was almost exclusively confined to Lancashire and Scotland, was it not?—I think that it existed in Yorkshire too.

The witness withdrew.

Mr. James Haddock examined.

Mr. J. Haddock.

17 March 1868.

12,049. (*Chairman.*) Are you manager of the Ravenhead colliery, St. Helen's?—Yes.

12,050. How long have you managed it?—Since 1854, 14 years.

12,051. And how many men had you in the colliery?—About 250 colliers, actual coal getters.

12,052. When you began were there any trades unions in the neighbourhood?—There is a trades union agent or delegate in St. Helen's, and has been for a number of years. I do not think, however, that he has been so long as 14 years, but he has been for seven or eight years.

12,053. In the last few years has the action of trades unions been more felt in your colliery or in your neighbourhood?—In our district there are scarcely one-fourth of the men in the union, but they exercise a great influence at times. When we attempt to reduce wages they prevent the other men from working by threats or intimidation, or that kind of thing. I do not think there are one-fourth of the men of the district in the union.

12,054. Do the union men interfere with the wages which the non-union men are willing to take?—They are interfering now. There is an attempt being made in the district to reduce wages, and the non-union men would be willing to go in, but they are made afraid by the threats and intimidation of the union men.

12,055. (*Mr. Mathews.*) Are your men on strike now?—The men at our collieries have been on strike for a fortnight.

12,056. (*Mr. Roebuck.*) What evidence have you of the interference of the union?—The evidence of our own men.

12,057. What have they told you?—They have been threatened.

12,058. What did the union men say to them?—They said that they would do for them; that if they did not give up "knobsticking," as they call it, they would do for them. There are a lot of them that dare not go to work. They are willing to go in at a reduction, but they dare not.

12,059. (*Mr. Mathews.*) Have there been any acts of intimidation recently?—It is of this recent strike that I am speaking. We have had no strike at St. Helen's for years. There was one of a few days (it only lasted a few days) in 1863.

12,060. What particular action of intimidation do you refer to as having occurred during the existing strike?—There were boys, for instance, driven back one morning by two of our workmen who belonged to the union.

12,061. What were their names?—John Johnson and William Corbett.

12,062. They were men you employed?—Yes.

12,063. And they belonged to the union?—Yes.

12,064. What did they do to the boys?—They drove the boys back as they were coming to work, but fortunately our watchmen caught them, or they would have lost that day's work.

12,065. Was there any other case?—One of our foremen was threatened by two men from a neighbouring colliery.

12,066. Were those union men?—I am told they were union men. Their names are Robert Lilley and Robert Bates.

12,067. They interfered with your foreman, I understand you?—They threatened him.

12,068. (*Mr. Roebuck.*) What did they say to him?—They threatened him that he should not go to work. You cannot in these cases get the exact words from the men. They chased this man out of a public-house because they knew he had been working during the strike, and then afterwards he was threatened.

12,069. How did they chase him out?—Of course he would be afraid of sitting amongst them when they began to upbraid him for working.

12,070. (*Mr. Mathews.*) They began to bully him, in fact?—Yes, and they would have gone to worse than that if he had not gone away.

12,071. (*Mr. Harrison.*) Will you tell us what they did do, not what they would do?—I was not present. The man says they threatened him, those are his words.

12,072. (*Mr. Mathews.*) Have you any other case to mention?—Yes. In the case of another of our men a message was sent by his own sons; his name is John Eccleston. Then we had another man, John Briars, who was threatened by a person named Swift. Swift said he would smash his head.

12,073. Was Swift a union man?—I suppose so.

12,074. Did Briars report to you that he had been threatened by Swift?—He reported it to our foreman.

12,075. Did your foreman know that Swift was a union man?—He did not tell him that.

12,076. Have you had any threatening letters sent to you?—No direct threats myself; the threats have been just to incite the men not to resume work, so as to get this reduction question settled.

12,077. (*Sir D. Gooch.*) Has there been any action taken against any of those men before the magistrates?—No.

12,078. (*Lord Elcho.*) Do you think that these threatened men if brought here would give evidence as to what passed between them and the persons who threatened them?—I really do not.

12,079. Does your knowledge of the men enable you to say that?—John Eccleston will not, he will not tell what the threats are, or who the parties are that threatened him.

12,080. (*Mr. Roebuck.*) Do you believe that he has been threatened?—I do.

12,081. Do not you think that John Eccleston might have some interest in misleading you?—No, I do not think so at all.

12,082. Why does he not tell you?—Because he does not want to divulge any names for fear we might take action on the matter.

12,083. Do you think he is afraid?—He is afraid; he dare not go out at night, for instance; he is a man of quiet habits, but he used to go out at night.

12,084. (*Mr. Mathews.*) He is a steady man?—Yes.

12,085. And his apprehension is that if he came here to give evidence on these points they would do some mischief to him?—Yes, and I am sure they would.

12,086. (*Lord Elcho.*) You say that since he has received this threatening notice, or since the strike, he has changed his habits, that whereas he did go out at night, he does not now?—He told me himself that he durst not go to church last Wednesday night.

12,087. Having previously been in the habit of going to church on Wednesday evening?—Yes. I do not suppose that when the strike is over the men indulge in any revengeful feeling, but just at the time they are very severe.

12,088. (*Mr. Mathews.*) You have no letters or any written documents to show us which have been sent to you about your conduct in the matter?—No, they have sent no letters to me.

12,089. (*Mr. Harrison.*) Are these men who are on strike all members of the union?—No, not one-fourth of them. There is a turn out at all the collieries in the district.

12,090. Is not this rather indirect evidence of the intimidation practised by union men when you cannot tell us what has been said at all?—I know that John Johnson and William Corbett drove some lads back that were coming to the works one morning; our watchman, however, caught those lads; if the watchman had not caught them they would not have come to the works that day.

12,091. As union and non-union men are mixed up in this, whatever is to be said against one set of men is to be said against the other; is not that the case?—No. I say that three-fourths of our men would come to work now if it were not for the threats of the union men.

12,092. You cannot give us any evidence of that?—The union men are very cautious how they use their threats. The women are just as bad or worse than some of the union men.

Mr. J. Haddock.

17 March 1868.

12,093. In point of fact, then, the men would come back if it were not for the threats of the women?—To a great extent.

12,094. (*Mr. Roebuck.*) The threats of the women arising from their connexion with men who are connected with the union?—Yes, they are the wives of union men. The men in our district, I may say, have been getting very good wages.

12,095. I want to ascertain from you how you connect this with the union. You proposed, I think you said, to reduce the wages?—Yes.

12,096. What was the next step taken. You told your men, I suppose, that you would be obliged to reduce the wages?—The union men in St. Helens had a meeting, and orders were sent over to St. Helens by the union at Wigan not to accept the reduction.

12,097. What evidence have you of that?—That is common report. We pay one colliery one week and another another, that is to say, we pay alternately, not all the men at one particular time. In this case some of the union men (we suppose it was) sent the bellman round to ask those whose notice was not up not to go in to work, and not a single man came.

12,098. The bellman went round with that intimation that they were not to go to work?—Yes.

12,099. What evidence have you for coming to the conclusion that he was sent round by the union?—Because several of the union men had told me that they would do all they possibly could to resist the reduction, and that we should not carry it.

12,100. Have any of the non-union men told you that?—No, not one.

12,101. So that all the opposition of which you are cognizant came from the union?—It did.

12,102. And therefore you conclude that the whole thing comes from the union?—I conclude, and have very good reason for thinking so, that the men not only at our colliery, but at other collieries in the district, are influenced by the union.

12,103. Do you know any of the leaders?—Mr. Rymer is the agent in St. Helens; he has lived there about two years.

12,104. (*Mr. Mathews.*) He is the organ of the union in St. Helens?—Yes.

12,105. (*Mr. Roebuck.*) Have you communicated with him on the subject?—No, I have not. I do not know him. I would not communicate with him under any circumstances. I have had conversations with the men in our own employ, and one of the men told me that the union intended to resist the 15 per cent., in fact they would not give in.

12,106. (*Mr. Mathews.*) There has been a reduction in the price of coals in your neighbourhood, has there not?—Yes.

12,107. How much?—In the Liverpool market coals since December have been reduced 2*s.* a ton.

12,108. Has there been any reduction of wages since then?—No; and then at home all coal as it comes out of the pit has been reduced 1*s.*, and slack 1*s.*

12,109. That reduction in the market price renders it necessary that wages should be reduced 15 per cent. as an equivalent, I suppose?—We cannot carry on the collieries without it.

12,110. Do you think that but for the union the men would accept the reduction and go to work?—I think the chief part of them would.

12,111. (*Mr. Harrison.*) The only case which you have come up from St. Helens to make against the union is that union men have told you that they intended to resist the reduction, and that if it were not for the resistance of the union you think the men would accept it?—I know this, from what different people say, that the men who are not in the union dare not come to us.

12,112. You say there are a large majority of them not in the union?—Yes.

12,113. And that the women are the worst in their treatment of those not in the union?—I say that the wives often jeer at them, and are as bad as the others, and no working man likes to be constantly jeered at.

12,114. (*Mr. Roebuck.*) Others than non-union workmen do not like to be jeered at?—No, they do not. If our men were left alone many of them would go to work.

The witness withdrew.

Mr. William Pickard examined.

Mr. W. Pickard.

12,115. (*Lord Elcho.*) I believe you are anxious to be examined now, while the last witness, Mr. Haddock, is present, as there is one of his statements you can give a different colouring to, from circumstances which you know, and which perhaps he is not aware of?—Yes.

12,116. You are, are you not, president of the Lancashire branch of the Miners' Association?—I am the agent of the Wigan district, the centre of this present strike, and was at the St. Helens meeting yesterday, comprising 10,000 miners; and I wish to say respectfully that the Wigan miners have not dictated any terms whatever to the St. Helens miners; the question of this strike rests exclusively upon their own shoulders.

12,117. (*Chairman.*) Are they a branch union?—They are a branch union.

12,118. Then it is a branch strike, I understand you to say?—Yes.

12,119. There is a strike of the whole union, or a strike at times of the branch, the whole union supporting it if the whole union agree to it. You say that the board at Wigan, as I understand you, had nothing to do with this strike at St. Helens?—As regards the conduct of the men, whether union men or non-union men, they are free to take what course they think proper.

12,120. (*Mr. Roebuck.*) Do you sanction the strike?—The men themselves sanction it.

12,121. Does Wigan support St. Helens in the strike?—Wigan co-works with St. Helens to resist the 15 per cent. reduction.

12,122. Do you support the men in St. Helens while they stay out?—The St. Helens men have funds of their own with which they are supporting their men, and the Wigan men have funds of their own with which they support their men. We stand independently.

12,123. Then what is your connexion?—Our connexion is in a national sense.

12,124. Then what the St. Helens people do you sanction?—No, what Wigan men do, the St. Helens men follow afterwards.

12,125. The St. Helens men have struck, do you agree or disagree with them; do you lend them the sanction of your approbation?—They simply go with the sense of the Wigan miners. They being the centre of the district they are guided by them; as they go they follow.

12,126. That means to say that the St. Helens men are governed by the Wigan men?—Yes, but the Wigan men do not dictate to the St. Helens men.

12,127. They only tell them to do it?—No, they do not tell them to do anything, they only form a ground of action for themselves.

12,128. (*Mr. Harrison.*) The action of the Wigan men was taken first?—Yes.

12,129. (*Lord Elcho.*) Did you, as head of the Wigan people, and as the head, apparently, of all the branch associations in that district, take any steps to prevent this strike at St. Helens, or since the strike has taken place have you done anything to induce the men to go in again?—Yes, all in my power.

12,130. That is to say that you recommended them not to strike against this 15 per cent. reduction?—I recommended them, not exactly against striking against this 15 per cent., but against a strike in a general sense. My influence has gone to use other means, but the sense of the men themselves, through

their representatives, decided that they would resist the 15 per cent. They consented that the masters should take off the last advance put on. In some cases that amounts to 10 per cent., and in some to 7½. And there is a paper which I should wish to put in, which was submitted to the meeting yesterday at St. Helens. The men were willing to accede to 10 per cent. reduction, where it had been 10 per cent. advance, and that as to the remaining five per cent. the dispute should be submitted to arbitration.

12,131. In one of your answers to Mr. Roebuck, I understood you to say that your association in the Wigan district was opposed to this reduction of 15 per cent. ?—Yes.

12,132. And that although you had taken no action in the way of telling the St. Helens branch, as a part of the general union, to resist that reduction, yet their practice was to take their cue from the Wigan association, and that knowing that you at Wigan had resisted this 15 per cent. reduction, they had resisted it at St. Helens ?—Yes.

12,133. Then it comes to this, that they have followed suit, as it were, the branch has followed the action of the head, and the head has done nothing in regard to that branch in advising it not to strike, or having struck not to go to work again ?—Yes.

12,134. But subsequently to that, since the strike has begun, there has been some large meeting of the colliers in the district, not confined to the Wigan district, as I understand you ?—Confined to the Wigan and St. Helens districts together.

12,135. Numbering, I have been told, 10,000 men ?—Y s.

12,136. And that meeting took place I have been told of yesterday ?—Yes.

12,137. And for some reason which you have not given, and which we have not asked, though originally it was thought advisable to resist the 15 per cent. reduction, you now think it desirable to make some reduction, and have recommended the men not to continue the strike but to accept a reduction ?— Yes.

12,138. And I understand that your feeling is that 10 per cent. might be accepted ?—Yes.

12,139. And that the difference between that 10 per cent. and the 15 per cent. should be settled by arbitration ?—Yes.

(*Mr. Haddock.*) The strike commenced first in St. Helens.

12,140. (*Mr. Mathews, to the witness.*) With your approbation as leader of the Wigan union the men are out to resist the 15 per cent. ?—I have no approbation in the question.

12,141. I suppose you as the organ of the union know what the men are doing as well as the men who are out know it in resisting the 15 per cent. ?—Yes.

12,142. You are willing you say to take 10 per cent. reduction, and willing to take another five per cent. reduction subject to arbitration ?—Yes.

12,143. And you have advised the St. Helens colliers to adopt the same policy ?—Yes.

12,144. And the only difference between you and the masters is now five per cent. There is a concurrence on your part to accept 10 per cent., leaving the five per cent. to arbitration ?—Yes.

12,145. (*Mr. Harrison.*) Are you responsible for this printed paper before us ?—No, it was submitted to the meeting yesterday as having been proposed by a well-wisher.

12,146. You recommended it, and urged it upon the meeting ?—Yes.

12,147. (*Earl of Lichfield.*) When was it that you came to the decision to accept the 10 per cent. reduction ?—When this dispute came on. The masters give notice according to the pay day coming on. After the decision of the Wigan masters and the St. Helens masters I had great work to get the men (and it has been my study and that of my colleagues in this room to-day to get them) to accede to the 10 per cent. They had a strong disposition to resist the whole, but we saw that the state of the trade would not justify that, and I have had interviews with some of the proprietors, but we have not got satisfaction. I may state that 21 proprietors have acceded to the men's terms, and the men are now at work.

12,148. Still you have not told me when you came to the decision to accept the 10 per cent. reduction ?—We came to the decision a fortnight ago, going on now for three weeks—previous to the strike, previous to the majority of the men being at work.

12,149. (*Mr. Harrison.*) Will you read that paper to which you have referred ?—"To the colliers of "St. Helens and its neighbourhood. Will you receive "a word of advice from one who is sorry to see you "on strike ? I do not counsel submission, but I "deprecate, for your own sakes, and your families' "sakes, a continuance of the struggle. I believe "you are disposed to listen to reason. I know "many if not all of you would gladly make terms on "what you believe to be fair and reasonable terms. "Such terms I submit for your consideration. Can-"not your differences with your masters be arranged "by arbitration ? Let each side appoint an arbi-"trator or arbitrators. Let these arbitrators con-"jointly appoint an umpire who shall decide in any "case wherein they disagree. The decision to be "final. Let this arrangement be permanent. Such "has been done elsewhere with success, why not "adopt it here ? Justice would thus be done to all "parties, and the fearful waste of time, money, and "temper, necessarily attendant on strikes, would be "heard of no more.—A Well-wisher."

12,150. (*Mr. Roebuck.*) Did you recommend that to the meeting ?—I did, I put it to the meeting.

12,151. What does that mean, does it mean that the body of masters and the body of workmen are to submit to the consequences of the arbitration, that is to say, if the arbitration decides in favour of the masters the men are to agree to it, and if the arbitration decides for the men the masters are to agree to it ?—Yes.

12,152. How do you propose to enforce this decision. You can find the masters, there they are about 25 in number ; but the men are thousands. Supposing that John Thomas, a workman, goes away and will not be bound by the decision, what then, do you think that the masters and the men are on equal terms ?—I think as far as the men in the union are concerned they are.

12,153. (*Mr. Harrison.*) You think that in a case of this kind you can settle a dispute, where you have an organized union with its officials ?—Yes.

12,154. (*Mr. Mathews.*) What security would there be that the men, if you advise them to accept arbitration, would abide by it if the arbitrator decided against them ?—I may say that from the showing of their own hands in a large meeting I know they would accept it.

12,155. (*Mr. Harrison.*) As a matter of fact, if this arbitration were accepted would the masters be under any legal compulsion to carry it out beyond the understanding that they would do on their side what the men would do on theirs ?—No.

12,156. (*Mr. Haddock.*) Mr. Pickard is assuming that all the men are in the union, but in our district only a fourth of the men are.

(*Witness.*) I beg to say that both society and non-society men held up their hands at the meeting. The Wigan men did not dictate to the St. Helens men.

12,157. (*Earl of Lichfield, to Mr. Haddock.*) Have the masters heard anything of this proposal on the part of the men to accept the 10 per cent. and submit five per cent. to arbitration ?—I never heard of it before and I do not think it was mentioned in any of the speeches of the meeting on Thursday.

(*Witness.*) Yes, I mentioned it in this form, that I had seen no less a person than Mr. John Lancaster, who is the president of the Wigan Coal Company, and I asked him if he would use his efforts to get it adopted.

The witness withdrew.

Adjourned to Tuesday next, at 11 o'clock.

1 Park Prospect, Westminster, Tuesday, 24th March 1868.

PRESENT:

The Right Honourable Sir WILLIAM ERLE.
The Right Honourable the EARL of LICHFIELD.
Lord ELCHO, M.P.
Sir DANIEL GOOCH, Bart., M.P.
HERMAN MERIVALE, Esq., C.B.
JAMES BOOTH, Esq., C.B.
JOHN ARTHUR ROEBUCK, Esq., M.P.
THOMAS HUGHES, Esq., M.P.
FREDERIC HARRISON, Esq.
WILLIAM MATHEWS, Esq.

THE RIGHT HONOURABLE SIR WILLIAM ERLE IN THE CHAIR.

Mr. W. Gleadow.

24 March 1868.

Mr. WILLIAM GLEADOW examined.

12,158. (*Chairman.*) I think you are the general manager of the Gresley Wood and Swadlincote Colliery Company?—I am.

12,159. How long have you been their manager?—Four or five years.

12,160. Have you had any experience of the action of trades unions?—I have had very considerable experience of them during the last 12 months.

12,161. In what way has the action of the unions affected your collieries?—By drawing the men out from one of our collieries entirely for several months, and by acts of intimidation and molestation.

12,162. When was it that the men were taken out of your colliery?—About September the 28th of last year.

12,163. In what way; did they leave suddenly?—They gave 14 days' notice, and then they left.

12,164. How many men?—70 of them from that colliery.

12,165. What was the effect of 70 going; did it stop the colliery?—It closed the works entirely, and we have just been trying to open them lately.

12,166. Were those 70 men the total number of the men?—Yes, of those that were remaining there.

12,167. What was the reason why they left; did they assign any reason?—They had no grievance at all, they were well paid, they merely wanted to join the union, and we had resolved that we should have no union men.

12,168. Had some unions been established in your neighbourhood?—About February of last year some delegates came and lectured, and a great number joined the union, and we gave notice to our men that we could not employ union men, and that was the commencement of it.

12,169. You gave notice to your men that if they joined the union they would be no longer in your employ?—Yes.

12,170. What was the consequence of that?—We went on the whole of the summer, until September, when there was a meeting of the unionists as I understand, and we had notices sent us. The whole of the men were withdrawn from this pit which I have mentioned and also from another pit which we have, but it did not close the other works.

12,171. You gave to your men notice some few months before, that if they joined the union they would be no longer in your employ. What was the next thing which you personally had knowledge of?—The next thing was that in September they gave me notice, and when the trade was coming on the whole of them turned out.

12,172. In September you received a fortnight's notice from all the men in your pit, to the effect "at the end of the fortnight we are no longer in your employ"?—We did.

12,173. And they left?—And they left.

12,174. What was the next thing that you did?—We endeavoured to replace them with fresh men. We introduced a number of men into the district, but those men were very much interfered with.

12,175. You introduced them from what colliery?—From Staffordshire and from Warwickshire. We brought a number of men, but they were always interfered with by the unionists.

12,176. Did you send out agents for men, or advertise for men, or in what way did you get them?—I sent agents out into Staffordshire and Warwickshire for fresh men, and brought them up in bodies, and they were met on the roads by the unionists.

12,177. You brought them up in bodies of about how many?—5 and 6 and 9 and 14, as well as I remember just now.

12,178. According as you found men that you could hire?—Yes.

12,179. In what way were they interfered with?—The men would congregate at the railway station to which they came, and would mob them. I myself have been down to meet men that have been coming, and these men would get round me, and get in between me and these fresh men, and mob us entirely, so much so that the men were pushed and taken away from me, although I had laid hold of them and endeavoured to get them through the crowd. They pushed the men on so that I had not the slightest chance with them.

12,180. Who were the men who so interfered between you and the other persons?—The unionists.

12,181. Were they men who had been in your employ or delegates from other places; that they were unionist is an inference which you draw, I suppose?—They shouted "Union for ever;" they let me know exactly that they were unionists, because they shouted to these men, "You join the union; do not "come and interfere with us."

12,182. (*Mr. Roebuck.*) They were your own former workmen?—Part of them; they were men from all the collieries round.

12,183. (*Chairman.*) As to the party that you met at the railway, for whom there was this reception in store, what was the effect of it upon the men that your agent brought up?—Before they were taken away I said to them, "Oh, do not be frightened at them;" and they said to me, "I cannot go—I dare not go," and they turned off and went with the unionists.

12,184. What was the language addressed to them by the people whom you call unionists?—"You are "coming to take the bread out of our families' "mouths," and such remarks as that.

12,185. (*Mr. Roebuck.*) Were there no threats of violence?—No, there were no threats of violence.

12,186. (*Chairman.*) Was there any threat by way of muscular action? I do not find that you speak of anything but their keeping you away from an opportunity to speak to the fresh men?—They would get in between me and the new men and persuade these new men. They dragged them, and got hold of their collars, and frightened them.

12,187. Were the words words of insult and indignity, or words only of persuasion?—There was strongish persuasion—I cannot say that there were any threats.

12,188. "You are taking the bread out of our "mouths" is persuasion. If they called them names that would bring them into hatred with their neighbours that is abuse, but up to the other point it is persuasion only?—Very strong persuasion.

12,189. If the persuasion is accompanied with movement of the fist I should call that muscular action—was there anything like that in this case?—It was muscular action so far that they laid hold of the men and got them from my grasp.

12,190. (*Mr. Roebuck.*) Did they put it in this way: "If you go and take the bread out of our mouths we will do so and so?"—No, they did not do that.

12,191. (*Chairman.*) Up to that point, "If you "come here you are taking the bread out of our "mouths," that is only matter of persuasion. "If you come here it shall be worse for you," that is within the limits of intimidation. But I do not gather from you that they went over the boundary between intimidation and persuasion?—Except that by force they separated them from me.

12,192. So that you had no opportunity to use your counter persuasion?—No.

12,193. What happened with the other parties as they came up?—The men would surround them, and they would get between them and their work, and they would come all around the colliery works, so much so that we were in fear of getting some damage done to the works; and they would shout, do every thing they could to frighten the men. The men would not dare go to work, and many of them walked off the bank, and said, "I dare not go to work with all that." Although they were not threatened openly, it was done in such a form that the men were frightened.

12,194. I can well understand words of the gentlest kindness being accompanied with a voice and a countenance that would let a man know that murder was very near at hand if he offended the gentle speaker—was it anything of that kind?—It was intimidation; the men would not dare go to work. I had many men who walked off the bank in fear.

12,195. Did you get any body of men to escort the persons that you had hired to the pit?—Yes, I got some special constables to meet them, but they were of no use at all; they were pushed about in the same way that I was myself.

12,196. About how many were they who were acting in this way with a view to prevent the persons hired from getting to work?—Some hundreds.

12,197. And of those how many were able-bodied men, and how many were women and children?—No women at all, all men and young men.

12,198. Apparently working men?—Yes, the whole of them.

12,199. When you say that they were unionists, unionists are most of them working men. A union of colliers is a union of working colliers, I suppose?—Yes.

12,200. These men, according to you, were working men, able-bodied men?—Yes, able-bodied men.

12,201. Were you able to keep any of the men that were brought to you?—We have retained a few of them, but nothing like the number we have had. I should think not above one-third, if as many.

12,202. You say that 70 was the crew, if I may use the term, at one colliery?—Yes.

12,203. About how many could you get to stay of those men that you brought?—Not above one-third.

12,204. If you brought up 70 men you could only keep 23?—I think that that is about as many as we have kept.

12,205. Can you advantageously work your colliery with 23 men in the ratio of one-third of the work and of the produce?—That colliery is not fully at work yet; we have opened it out about a fortnight or three weeks ago, but we have not the complement of men, nor anything like it.

12,206. Is it necessary to have the complement of men to do effective work, with interdependency of working, one man being employed to keep the colliery dry, and so on?—Yes, You want a certain number of men to carry it on, and of course you work it at a loss unless you raise sufficient coal.

12,207. All the preliminary expenses must be spread over the smaller quantity which you raise?—Yes.

12,208. Did you try anything in the way of getting the Midland Railway Company to stop a train so as to mislead the persons who were interfering with you?—I tried in every way to deceive those men who could meet the new men, because I knew the trouble of passing them. I knew that the fresh men would not be able to stand the acts of these men towards them, consequently I got the Midland Company to stop the train at my siding at the bottom of our colliery incline, and I brought them up our incline there.

12,209. And let them get out at an unusual place?—Yes.

12,210. Those men you could get to your colliery, I suppose?—When I got them to the colliery, it was all over the district in a short time, and hundreds of men would come round the works, and when I have brought men late at night, those men have been all round the works peeping in at the bailiff's house and at the carpenter's workshops, and so on, so much so that we were in great fear of having some damage done.

12,211. Have you had any cases of intimidation brought before the magistrates?—Several.

12,212. Have convictions followed your applications to them?—They have fortunately, and that put a stop to the thing. It was getting past all bearance. We should not have been safe any of us, if we had not got some convictions.

12,213. Is this colliery the Gresley Wood Colliery?—It is the Swadlincote that has been shut. The Gresley Wood is another that we have been working with a partial number of men. We had a number of men drawn out there at the same time that these other men were drawn out, but the colliery has not been closed. It has been worked at a most serious loss however.

12,214. You have a list, I think, of the cases of molestation that came particularly under your notice?—Yes. About November I began to take notice of them; November the 12th, Edward Lee was stoned by a man Radford. We prosecuted him, and he had three months imprisonment for it.

12,215. What sort of stone was it, and what sort of effect had it upon him?—He was hurt by stones thrown at him on his way to work. This man Radford, as I have said, was convicted and had three months imprisonment.

12,216. (*Mr. Hughes.*) Was he convicted as a unionist?—Yes.

12,217. (*Lord Elcho.*) Was he the only assaulter of the man, or the most active?—The most active.

12,218. He was attacked by more than one?—Yes.

12,219. Was Radford the only one against whom any charge was brought?—His was the only case in which we had clear proof.

12,220. (*Mr. Hughes.*) Where was he proved to be a unionist?—I believe it was admitted.

12,221. You have not any report of the case?—No.

12,222. (*Mr. Mathews.*) When you say that he was punished as being a unionist, you mean for some act of aggression, not for the mere fact of being a unionist?—No, it was for the act of stoning.

12,223. (*Chairman.*) Words came from the party that these men were acting with indicating that they were earnest for promoting unionism; they appeared all to be acting in the same interests?—Yes.

12,224. (*Mr. Roebuck.*) But as I understand you, you say that it was never questioned by the man himself who was accused that he was a unionist. He acknowledged, as I understand, that he was a unionist; he acted upon unionist principles, and for the purposes of the union he endeavoured to drive that man from his work?—Yes.

12,225. (*Mr. Hughes.*) When you say he acknowledged that he was a unionist, when and where did he acknowledge it, was it before the magistrate?—I do not think that there were was any question about it.

12,226. He was summoned for throwing stones at Radford, and was convicted for throwing stones at Radford?—Yes.

12,227. (*Chairman.*) Except that there were men at work in the colliery, had those other men any grievance that you know of?—Not any.

12,228. Those men left your works and came away,

Mr. W. Gleadow.

24 March 1868.

and at the time when they so came out there had been men that you considered unionists, and delegates from unions acting in the manner which you speak of?—Yes.

12,229. And there was a difficulty in getting any men to go down your shaft after that time?—Yes.

12,230. And your colliery became empty, and among other things, some of the new men, as you believe, were assaulted by the same party, in the same interest?—These men openly admit that they are unionists. When they get hold of these men they say, "Come up to the People's Hall, we will pay your "fare back again," and these men that were turned back would be taken up to the hall and have money given them, and be sent off by train by the unionists.

12,231. Have you seen them sent off?—Yes, as to these men that I am speaking of now, I had men with me as special constables from my own pit who followed them down to the Hall after they had driven me from them, and they saw them enter the place and they disappeared afterwards.

12,232. (*Mr. Mathews.*) Although you have no legal proof of the fact of these men belonging to the union, there is no manner of doubt, but it is a matter of perfect notoriety in the district, that they did belong to the union?—Yes.

12,233. No sane man doubted it?—No.

12,234. (*Mr. Booth.*) You have no doubt that these men so interfered with were desirous of working with you on the terms which you offered?—No doubt of it.

12,235. And they were prevented from so working by the interference of other men?—Yes.

12,236. (*Mr. Mathews.*) Is it not the fact, from your experience, that the moral influence which these men imparted into your district exercised is infinitely stronger than any physical demonstration could be?—Yes, there is a sort of underhand way of threatening the men. The women go to the men's houses and say, "Ah, if you do not come out soon I am sure you will catch it." It is underhand threatening.

12,237. There is a sort of intimation that these people convey to the new men that alarms the new men as much as threats of personal violence?—Yes. I have no hesitation in saying that if we had not got convictions we should have had something very serious happen in our neighbourhood. We have had our windows broken, and we have had men interfered with while going about in our neighbourhood. I should not think of going out in the dark there by myself.

12,238. (*Mr. Hughes.*) You have had your windows broken, you say?—Last week.

12,239. Windows of your firm, do you mean?—No; one of our men was working close to our works, and on Saturday week the men smashed his windows. And they lately went down to four houses that I tenanted with Staffordshire men; fortunately the police got some intimation of it and prevented them, or else they would have smashed the windows of these men's houses.

12,240. (*Mr. Roebuck.*) I understand you that the sole cause of quarrel between you and these men was that you said you would not employ union men?—Yes.

12,241. And that that led to all the subsequent rioting and opposition to you?—Yes; we required to have free labour.

12,242. Therefore, in your mind, you connected it distinctly with unionism, and said that unionism was the primary cause of your suffering?—Yes.

12,243. (*Chairman.*) If I understand you right your men never came and remonstrated; they never gave you notice that they were going to leave you until there had been this interference by strangers coming there?—I must explain that, as a district, we were quiet and peaceable, and doing well up to February of 1867. About February 1867 a man named William Brown came and lectured. He had open air meetings, and did all he could to get large bodies of men there, and lectured to them. That was the first start of unionism. He said, "You have not very much to complain of, but" (he said) "I will get "you short hours." That was the first thing he tempted them with. "I shall get you shorter hours "and more pay."

12,244. (*Mr. Mathews.*) Did you hear Mr. Brown lecture?—No, I did not; but I had it represented to me, and I said, "Well, this man is going to lecture; "we must take care of ourselves," and I said, "We "shall not employ union men."

12,245. (*Chairman.*) After that you received notice. Did anybody say that it was in consequence of that that they were ordered out?—The men shouted in my face "Union for ever" when they gave their notices in. I went to see them and reason with them. I said, "What do you want? your pay is right; "you are satisfied; you have no grievance at all." It was all of no use; they merely cried, "Union for "ever." They met me with shouts and nothing else.

12,246. Mr. Brown's exhortation had been pretty effectual then. It was your own men that shouted "Union for ever"?—Yes.

12,247. (*Mr. Roebuck.*) Mr. Brown sowed the seed, but I suppose that the soil was quite prepared for it?—I suppose so. The chief men who supported the union have been men who were always bad workmen in the colliery; they have had most to say. They would only work two or three days in a fortnight, if so much as that. These men have been foremost, and in order still to get the allowance from the union which they have received they would keep the union alive for an indefinite time.

12,248. Has your experience taught you that the most active persons in the union are the most inefficient workmen?—They are lazy fellows; the bigger spouters, the worse workmen.

12,249. (*Mr. Mathews.*) The great talkers are little doers?—Yes.

12,250. You spoke of having your men protected by the police. Is the police very effective, on those large occasional gatherings, against the bustling and bullying of the men out on strike?—Well, we have not found them so effective as they should be; we have found very little good beyond the influence of the uniforms; perhaps that does something or other; but as for defending us from any acts of molestation or interference, or where men have been hurt, setting the police on to it, they have been of very little service to us.

12,251. (*Mr. Roebuck.*) Are those policemen chosen from the people of the district?—I am not sure, I think that they are foreigners.

12,252. (*Mr. Mathews.*) They are the county constabulary?—Yes.

12,253. (*Mr. Roebuck.*) Did you ever trace any sympathy between the police and the men out of work?—They fraternize with them.

12,254. Possibly you may think that that is the cause why they do not find out offenders better?—There is something the cause, they have been of very little use in finding out anything we want. Where men have blackened their faces, as they have done with us, and turned their collars up and put their hats down over their faces, and interfered with the men going to work, if we set the policemen on they would never be of any service to us in finding them out.

12,255. (*Mr. Mathews.*) You do not think that there is any sympathy between the union men and the police, beyond the ordinary sympathy of men in the same station of life?—I should not like to make a charge against the police.

12,256. (*Earl of Lichfield.*) Do you mean to say that there have been actual cases of outrage not detected by the police?—Yes.

12,257. Many cases?—Yes.

12,258. Can you name some?—There is a boy of the name of Joseph Pope, who on November the 30th was threatened and sent back from work by three men, and they took his dinner from him, and told him that if he did not go back they would kill him. I offered 2*l.* reward for the apprehension of the offenders.

That was a very easy case to detect, one would think, because the police were all round the district, and this lad was coming to work at 6 o'clock in the morning. The police might have got on the track, but they never did.

12,259. (*Mr. Roebuck.*) Do you think the boy knew the men?—No.

12,260. He would not have known them if he had seen them again?—No, they had got their coat collars turned up and their faces covered up. Here is another case, which occurred on November the 12th—Joseph Wardle beaten by three men disguised, and thrown into a brook. This man was coming alone against my instructions. I organized the system at one time that they should be escorted from the far end in a body. This man, however, wanted to get a little earlier to his work. Those men met him on the road, and kicked him and threw him into the brook. There is another case, that of Joseph Baker who was a Staffordshire man. He happened unfortunately to have had some drink, and coming home he was brutally beaten and kicked by three men, rendering him unfit to work for several days. We did all we could to find out those cases, but not a man could we find. James Hardy on January the 22nd 1868 was beaten and stoned, but we cannot find out the offenders. On January the 24th 1868 William Brotherhood was stoned on his way to work, and on the same day Henry Hinks was stoned.

12,261. (*Mr. Roebuck.*) Name the cases in which convictions followed?—Patrick Ines was stopped and turned back from work. Thomas Wilkinson, who was the most forward person in the matter, we proved, and he was convicted and had one month's imprisonment. That man Joseph Baker, of whom I spoke just now, was a most fearless man. I have seen him stand and say to the men, "Why do not you go to work? I have come here for work and mean to have it." But that man was thoroughly frightened afterwards, so much so that, after this beating that he had, he came after 10 days and said to the bailiff, "The place is too hot, I cannot stop," and he was obliged to leave. I thought nothing would have turned that man off. On February the 27th of the present year John Wallbank was beaten at Swadlincote on his way to work. I believe that we have some clue to that case. Then, on February the 28th of this year, Joseph Stirland, a bailiff, was interfered with, and a number of workmen mobbed and obstructed him in passing from work. On March the 12th Thomas Bradbury was beaten, stoned, and threatened with certain death. That case is now being proceeded with; we have a summons out against the man. On the same day Edward Sherwin and constables with a quantity of workmen experienced a repetition of the offence committed on the 28th of February. This is at the colliery which has been stopped, which I have been trying to open. They threatened that blood should be shed before that colliery was opened, yet I could never get at the evidence of that; it comes to us through the women and the lads.

12,262. (*Chairman.*) Were they prosecuted for assaults, or under the statute against intimidation and obstruction?—For assaults, I believe. On March the 13th James Archer, at the toll-gate house, had his windows broken. This was done by a large body of unionists in various disguises, about 9 o'clock in the evening. And on the same day George Heywood, living near the toll-gate, had the woodwork and glass of his house made a perfect wreck, and they marched down to those four new houses which I had taken for the Staffordshire men; they marched down with the intent of smashing the whole of the windows, but the constables were before them.

12,263. (*Mr. Mathews.*) Is it generally in the night or in the daytime that these things are done?—In the dusk; in the daytime they are as quiet as possible.

12,264. So that it is exceedingly difficult for the police to detect the parties?—Yes.

12,265. And the fear of these acts, and the indefinite threats of the workmen, have a greater effect in deterring new men from going into a district than anything else?—Most decidedly.

12,266. (*Chairman.*) Is the strike now going on?—I believe it is about finished; they have not got their pay for last week.

12,267. (*Mr. Mathews.*) Did the strike arise from the declaration on your part that you intended to employ no union men, or was it on a question of wages?—No, it was not a question of wages at all.

12,268. (*Lord Elcho.*) You have said that they have not got their pay for last week; was that owing to want of funds or to disapproval of the strike on the part of those who paid?—I think for want of funds. I think that there are men out in Yorkshire, and the funds, I fancy, are not forthcoming.

12,269. (*Earl of Lichfield.*) You have stated that in some instances the men have come to you and complained that they were afraid of going to work, although willing to work as non-union men?—Yes.

12,270. Would any of those men come here and give evidence?—I think so.

12,271. Will you supply us with the names of some men who would give us that evidence?—Yes.

12,272. (*Mr. Roebuck.*) Do you think that they would run any risk by giving that evidence?—I do not know. I may say that I have asked men to go and appear against other men for acts of intimidation, and they dare not do it.

12,273. (*Chairman.*) In what way have they said that to you—"I do not dare," or "Really I do not remember much about it"?—They would say openly that they did not dare.

12,274. (*Mr. Booth.*) Are there any more cases of intimidation which you are desirous of stating?—I think not any that I can recall to mind now.

12,275. (*Mr. Hughes.*) You say that one-third of your men who came from Staffordshire remain with you?—Yes, I should think so.

12,276. Are any of those the men whom you have mentioned to us from that list as having been intimidated?—Baker was one of those men.

12,277. (*Mr. Mathews.*) When you speak of Staffordshire, do you speak of North Staffordshire or South Staffordshire?—South Staffordshire.

12,278. (*Mr. Hughes.*) Have you had complaints from other men belonging to that one-third besides Baker?—Oh yes, and I have to protect them in every way; I dare not leave them to themselves.

12,279. (*Earl of Lichfield.*) What number of men have returned to your employment?—Last week they were all applying.

12,280. You have opened the pits now in consequence of having a sufficient number of men to work them?—Yes.

12,281. What number of men have you now employed?—Perhaps 200.

12,282. Out of how many?—Out of 300.

12,283. (*Mr. Roebuck.*) Do the men that come back, come back with the understanding that they are not belonging to the union?—Yes.

12,284. (*Mr. Mathews.*) Do you think that there are any men in your employment who do belong to the union without your knowledge?—I should not be at all surprised, but we do the best we can to learn whether they do.

12,285. (*Mr. Roebuck.*) Do you allow, for example, any delegate from the union to come on your works?—No.

12,286. (*Mr. Mathews.*) Have you any personal intercourse with the delegates of the union?—I have had personal conversation with them.

12,287. You do not recognise them as arbitrators between you and your men?—No, they wanted to arbitrate the matter, but as the men had no grievance themselves, I would not open up the question with the delegates.

12,288. (*Mr. Hughes.*) What did they want to arbitrate?—I do not know. Whether the men should belong to the union, I presume.

12,289. They wished, in fact, to get from you a

Mr. W. Gleadow.

24 March 1868.

licence for union men to remain in your works?—Yes.

12,290. The original cause of quarrel being, in fact, whether the union men should or should not be employed?—Yes.

12,291. (*Mr. Mathews.*) They wished you to reverse your policy, in fact?—Yes, one person met me one day and said, "I am coming to see you to-morrow." I said, "What about," and he said "I am deputed by"—somebody else, I forget the name now—"to come and see if we cannot make this grievance right." I said, "What grievance?" He said, "Well we are coming on behalf of the union." I said, "Well you "need not come to see me if you are coming on "behalf of the union, as I have no question with my "men but what we can settle between us."

12,292. (*Earl of Lichfield.*) Have you required any of your men to sign an agreement pledging themselves not to belong to the union?—Yes.

12,293. Is that the case with all the men whom you now employ?—With the old men I have not done that, but with fresh comers I have done so.

12,294. (*Chairman.*) During the four or five years that you have had the management, have you been on perfectly friendly terms with your men as far as friendliness extends between employer and workmen?—Perfectly so.

12,295. Since the action of the union has come in, has there been a different feeling?—Oh, decidedly; the men are not the same men, they are quite beside themselves; they rather look to the union and all that as a go between, and they are as insolent in their way as possible; they shout to you on the road and all that sort of thing.

12,296. (*Mr. Roebuck.*) Before the union interfered was there ever any question between you and your men about wages?—Nothing but what has been conceded.

12,297. There has been some question then?—There have been advances during that time.

12,298. Will you allow me to put the questions in my order. There have been questions between you and your men about wages?—Yes.

12,299. They have been settled amicably between you and your men?—Yes.

12,300. And you have either agreed to what they desired, or have given them such reasons as satisfied them that you could not agree to it?—Quite so, and we never had a turn out.

12,301. The result has always been an amicable settlement of all the questions between you?—Yes.

12,302. That always happened before the union came?—Yes.

12,303. (*Mr. Mathews.*) Previous to the Union being established was there any obstacle to the freest possible discussion of these questions between you and the men?—Not the slightest.

12,304. There was a continued friendly relation between you and them?—Yes.

12,305. Has that been altered since the union came?—Yes, the men were always friendly and would say "Good morning, sir," but now there is such a look as is anything but pleasant.

12,306. Indicating an estrangement?—Most decidedly so.

12,307. Has there been any attempt on your part to revive that friendly feeling?—I am still always civil and pass the time of day to my men, but though I say, "Good morning, lads," they do not return it.

12,308. They do not reciprocate that feeling?—No, they greet me with a shout.

12,309. Not one of laudation, but a hostile shout?—Yes.

12,310. (*Earl of Lichfield.*) When you speak of the union, do you refer to any particular union?—No, I do not.

12,311. (*Chairman.*) Is Mr. Brown employed by the delegates?—He is the agent of the union who came and sowed the seeds in our district.

12,312. (*Mr. Mathews.*) What is the union called?—I do not know.

12,313. Do you suppose it is called the South Yorkshire Union?—We understand that they get money from South Yorkshire and that they have some connexion with it.

12,314. (*Mr. Roebuck.*) Have you ever heard that they have any connexion with London?—Mr. Potter once came down, and I had a word or two with him, I think, when he was down there.

12,315. He came down while there was this dispute between you and your men?—Yes.

12,316. Did he come down with peace in his mouth?—No, certainly not. He was at the prosecutions in the Hall during the time that the magistrates were trying the men. Then there was a meeting at night of the unionists, and he used most extraordinary language as to the want of justice that was doled out by the magistrates, finding fault with them in every way.

12,317. (*Mr. Mathews.*) By whom were the men defended?—Some gentleman from Wakefield, a Mr. Wainwright.

12,318. It was not Mr. Roberts the solicitor?—No.

12,319. (*Mr. Roebuck.*) Was Mr. Wainwright an attorney, and not a barrister?—I understand an attorney. I am not sure.

12,320. (*Lord Elcho.*) Do you know where Brown is now?—I can say that within the last two months or so he has made two incursions from our district—one to Moira, the other to Coalville. Moira is three or four miles from Gresley Wood, and Coalville about 10 miles. Both these districts were working on good terms with the masters, and working satisfactorily, when he tried to persuade the men to join him and defy the masters. He, however, got no success. At Coalville the men had such bitter experience of the union some years since, that they have scarcely now recovered from the strike made at that time.

12,321. (*Chairman.*) Was the trade bad at Moira?—No, very prosperous.

The witness withdrew.

Mr. A. Higginson.

Mr. William Eley examined.

12,322. (*Chairman.*) Are you manager of the Swadlincote Old Colliery?—I am, and of the Cadley Hill Colliery.

12,323. Is Swadlincote Old Colliery distinct from the colliery of Mr. Gleadow, of which we have just heard?—Yes, quite distinct from the Gresley Wood and Swadlincote collieries.

12,324. How long have you had the management of it?—I have been in my present situation 10 years, but I have been in the district nearly 20 years.

12,325. Till late times has the colliery been carried on without any interference on the part of unions that you know of?—During the 20 years that I have been in the district we have not played a day or an hour on account of any dispute with our men up to the time o Brown and others coming down to agitate in February 1867.

12,326. Did you know by report where Brown came from, what district he had been addressing before he came to you?—Yes, we knew of him, he was in North Derbyshire and South Nottinghamshire.

12,327. Had he continued there any length of time?—He had. I believe there had been a colliery standing there, the Hucknall colliery, for 17 or 18 weeks, from the effects of the union.

12,328. What induced him to leave the Derbyshire district and come to your district?—I cannot say, without it is that things were ill in that county, and he came into a good one where all was prosperity.

12,329. There might be an attraction towards you or a repulsion from them, which was it?—I believe there was both. As far as my observation has gone I find that the unions generally plant themselves where

there are good doings, where there is prosperity and all parties are doing well.

12,330. Unions prosper where the trade prospers?—They generally plant themselves there; but the prosperity generally, indeed, universally, I think, withers under their influence.

12,331. At your colliery what has been the result of their interference?—After Brown's giving a few lectures in the midst of the neighbourhood, holding forth to the effect that the coal kings must be put down and the tyrants of agents must be got rid of, I found that the men were unmanageable, and I did not require any information from any other quarter to find who were the members that had joined the union. There was a defiance about them; you could see that they were under no kind of restraint or discipline, and we were under the necessity of shutting up some of our works as the men were unmanageable, and they would not be safe under the circumstances. Knowing this from the speeches of the advocates of the union we determined on discharging at that time all members of the union, as it was impossible to manage the collieries if they remained. I found that our deputies or over-men were insulted, that the men would put us and all regulations at defiance. Consequently we discharged a number of men on that account. In March we discharged 10, in April 30, in May 35, in June 42, in July 8, in August 10, in September 10—total, 145.

12,332. When you had your complement of men working how many had you?—We had 500 hands when we had our full complement.

12,333. Was your hiring monthly?—Fortnightly. 14 days' notice.

12,334. That is to say you hire them and the contract is that either side may part with 14 days' notice?—Yes.

12,335. I observe that all your men were discharged in separate bodies. That happened accidentally, I suppose?—As they had joined they were discharged. In September there were notices sent to us which no doubt were written by the union advocates, inasmuch as a great number of the notice papers were written by one hand, and according to the statement of the men they had them given them when coming to work. At the end of September, with a view, as was stated then, that they would bring our colliery to a stand, I received 140 notices from the men. I have got a number of them here to show that most of them had been written by two or three hands, the men putting their crosses (*handing some notices to the Commissioners*).

12,336. (*Mr. Mathews.*) Were these notices given to you in the legal form?—The notices, you will see, were in many cases that I was to leave my employments in 14 days; but I suppose it was intended to mean that they were to leave theirs.

12,337. (*Chairman.*) Are the signatures written by the same hand?—Yes, a great number of them.

12,338. You mean that the signatures were written by a person who brought pen and ink with him into that district?—A great number of them are signed with crosses, and no doubt many of them have been signed by the delegates. Some of them confessed that they really did not know that they had got a notice paper until their wives had brought it from the meeting.

12,339. Having discharged these men did you try to get men to replace them?—I saw there was a great deal of difficulty and danger in that, and I did not go to seek out for fresh men, but if there were men that did come and volunteer to take work I found them work. In one instance I employed four men. As soon as these four appeared hundreds of the union men followed them to the dwelling, and I had a staff of 10 men on guard to keep the dwelling safe all night on account of the intimidation of the men, who were told it would be better if they returned, and all the rest of it. I kept them a fortnight; but ultimately they persuaded these men to give notice, and they gave them money to quit the neighbourhood. Afterwards they smashed the windows of the house they had lived in. I had found them a house and put them in.

12,340. That house was damaged?—That house was damaged. The windows were literally smashed in, and some part of the woodwork was also broken.

12,341. Have you tried to import other labourers?—I had seven others out of Warwickshire a short time ago.

12,342. You did not send for them?—I did not send for them. I gave these instructions to the men at work that if there was anyone that wished to have work under the circumstances we would offer him work and protection to and from work as long as he wished; and these men volunteered to come, but there was no peace for them. They were paid their fare by the union men, who sent them away again.

12,343. Those men came up in September, did they not?—Yes, we had the greatest struggle then.

12,344. Are the men out now or are your works carried on?—There are a great number of the men out now, because the trade has been ruined. We have lost our winter trade, and now we cannot send coal into the market. All the men would come to work now, we have been given to understand; but in consequence of the trade having been driven away there will be a good deal of poverty and distress I am afraid.

12,345. You say that trade is driven away. Consumption of coal must go on; why is not your coal consumed?—If the coal merchants make contracts for the winter, or for 12 months (it is usual for them to do so at the latter end of the year), and if you cannot take their contracts they send them elsewhere; consequently we have no chance of making the contracts in the spring, and we lose the trade.

12,346. (*Mr. Roebuck.*) Can you give us any instances in which coal merchants have left you?—Yes, there was a customer of ours at Worcester who used to take from 150 to 250 tons a week who has not taken a truck since that time. But as our trade is spread over something like 200 miles area, of course it has the same effect elsewhere.

12,347. (*Earl of Lichfield.*) Do you know where that customer gets his coal from now?—I sent him a great many waggons, and he has been getting his coal chiefly from Cannock Chase, using our waggons. We have not had any dispute at all with the men, I may say, and we have not given anything more for the work being done; but on account of the effects of the union, through our having a larger staff of men to keep strangers safe, and having a larger number of deputies for the quantity of coal raised, that quantity of coal has cost us 1*s.* 1*d.* a ton more than it would have done had the union not been in our district.

12,348. (*Mr. Roebuck.*) And that without raising the wages?—Without raising the wages.

12,349. (*Mr. Mathews.*) That is to say, if the colliery is half worked, the common charges are more by 1*s.* 1*d.* a ton than they would be with regular work?—Yes, but in this case there was more difference, because we require to have extra overlookers to keep the men safe whom we take from one part of the works to another.

12,350. The whole together entails an additional cost to the coalmaster of 1*s.* 1*d.* a ton?—It does at our collieries.

12,351. (*Chairman.*) What is the price of a ton at the pit's mouth?—Our average of sales at the pit's mouth does not amount to 6*s.* a ton.

12,352. (*Mr. Mathews.*) You mean taking small and large together?—Taking small and large together the average price would not exceed at any time 6*s.* a ton. It would be nearer 5*s.* 6*d.*

12,353. What is the rate of the highest?—The rate of the highest that we make, which is a very small quantity out of the main coal, would be 12*s.* a ton; the lowest is 1*s.* 8*d.*

12,354. And the mean between those would give you 6*s.* 10*d.*?—It never amounts to more than 6*s.*

12,355. (*Chairman.*) It costs you 1*s.* 1*d.* a ton

Mr. W. Eley.

24 March 1868.

more than it did, you say; do you add on that to the price, or are you obliged to lose it?—It is a dead loss to the proprietor. We have no chance of getting a penny of it returned. We did advance the prices of our slack 1*s.* per ton to *local* manufacturers during *part* of the time the strike was in operation, but in the aggregate our coals were not sold for a greater price than in the previous year.

12,356. (*Mr. Roebuck.*) During the strike have there been any acts of intimidation or violence?—I will read the list that has come under my notice in this immediate district. I may say that during November, December, and January I have constantly been out with the specials. We have had 30 to fetch men to their work in the morning and also to take them back at night. There have been hundreds of men lying beside the road during that time both at morning and night armed with sticks, and women with tin pans, kettle drums, and all sorts of annoyances possible. In November, as I was going to fetch two men at 5 o'clock in the morning, I found Mr. Bunting heading something like 80 men, and there were perhaps as many as 80 women who turned out with tin kettles, and drums, and cowhorns, and everything they could think of. During three or four months I do not suppose that I have been in bed after 5 o'clock in the morning, and it is very rare that I have found it safe to go to bed before 2 o'clock on account of the annoyance given by the men and the manner in which the passions of the men have been excited by the inflammatory speeches of advocates who have come from time to time.

12,357. (*Chairman.*) Have you heard any of them?—Yes; I have heard plenty of them. I have sat in my house and heard Mr. Brown shouting out in the hall, "Down with the coal kings and the tyrants," and he told the men that they were living in some of the houses which were their own, intimating that the capitalists had got it out of the hard earnings which the men themselves ought to have had. Pointing to my house, he said, there was a house built out of the blood and bones of the working men, and I sat within hearing four hours one night, and they said they would have it down stick and stone. I heard all those speeches, and there have been speeches of this inflammatory character going on for months and months, and it is a wonder we have not had a great deal more depredation, and I attribute it solely to the good sense of the colliers of our district over many others that we have not had more sacrifice of life and more sacrifice of property.

12,358. I do not understand what offence you gave except having a tolerable house?—What Brown said was this, that I was to be a marked man, because I came into the district with my boot toes out, and had since got a house; at least, that was the inference I drew.

12,359. Because you had saved money?—Yes, because I had saved money.

12,360. And that money was to be distributed among them I suppose that did not work for it?—He told them candidly that they must have some of the capital by hook or by crook.

12,361. These are men of great intelligence many of them, and it does not seem very rational to say that because a man has got some money you ought to take it away from him and keep it yourself. Did Brown give any reason to the men more than this: "Your "bones and muscles hewed the coal out of which the "profit was got that built that house, and that is a "reason you should take it back again." Was that the line of argument?—This was intended to be the lesson from his teaching, no doubt; that they were very hardly treated and that they must have some of the masters' capital. Although they could not particularly explain what was the grievance, yet they were told that if they did not join the union they would have occasion to regret it, and I think they were led to believe (at any rate the teaching had that effect upon those who were taught that wherever there was capital that capital was ill-gotten gains), and they filled the men with imaginary grievances which they could not explain, and if you asked a number of men they could not tell you whether they had been ill-used, nor what they wanted in any shape, but still they ought to have something that somebody else had. In the beginning of July or the latter end of June I was visited by the union delegates at my own residence, and they wished to know whether there was any chance of compromising the matter with the masters. I have some correspondence which took place with them afterwards, showing what they proposed on behalf of the men.

12,362. These are the elected delegates?—Yes, and for whom the union was finding the money. There was a portion of the money (5*s.* per head I was told by one of the delegates) coming out of Yorkshire; and 3*s.* a week from the Trades Alliance; the four delegates who waited upon me, were from those two unions. This correspondence acknowledges which, and gives their names and address.

12,363. Many of those delegates are remarkable men; were any of these men men of name and note?—I have got the names here. Shall I read the correspondence.

12,364. If you please?—After they had been at my house I received this: "United Kingdom Alliance of "Organised Trades, Randal Street, Highfield, Sheffield, "July 2, 1867. Mr. Wm. Eley,—Sir, Enclosed I forward you memorandum this day agreed to by the "deputation who yesterday waited on you and the "other gentlemen at your residence in reference to "the present dispute with the miners of Gresley and "the neighbourhood. I shall be glad if you will lay "the same before the masters as agreed last night and "let me know their decision thereon. Trusting that "negociations will be productive of good to all concerned, I remain, sir, on behalf of the deputation, "yours truly (signed) Wm. Dronfield, General Secretary to the Alliance. P.S. Mr. John Normansell, "Nelson Street, Barnsley, secretary to the South "Yorkshire Miners' Association, would be glad to "hear what decision is come to by the employers, or "to give you any information as to the working of "their association should you require it.—W. D." "Copy of memorandum.—At a numerous meeting of "the miners of Gresley and district held last night a "resolution was unanimously adopted to the effect "that the men agree to leave the settlement of their "case in the hands of the deputation from the Miners' "National Association and the United Kingdom Alliance of Organised Trades. With the view, therefore, "of bringing about a better understanding between "the employers' agents and their workmen we beg to "make the following suggestions:—1. That the employers and agents agree to withdraw their opposition "to the miners' union; 2. That all the men resume "work immediately afterwards, pledging themselves "not to make any demands on their employers or "agents, except such as are in common with the "working of the collieries of the district as may be "mutually agreed upon by both parties; 3. That no "advantage be taken by the employers or their agents "of those in their employment; 4. That in order to "give effect to the foregoing conditions the deputation "respectfully recommend that the same be mutually "agreed on, and strictly observed for a period of at "least 12 months from the present date. Signed on "behalf of the Miners' National Association, John "Normansell, John Nixon; on behalf of the United "Kingdom Alliance of Organised Trades, signed, "George Austin, president, Wm. Dronfield, general secretary. P.S.—In the event of any misunderstanding arising in carrying out the foregoing "suggestions the deputation will, if requested by "either party, be glad to offer their services with the "view of promoting a better understanding between "the employers and employed, which is essentially "necessary for the well being of all parties."

12,365. "That no advantage be taken by the "employers"—that does not convey a definite notion to my mind?—It says, "That no advantage be taken "by the employers or their agents of those in their

"employment." After we had heard the statements of the delegates, one stipulation they made was that we would take all our own men into our employ again.

12,366. You were to take no notice and make no change in consequence of the property being taken and distributed?—That is the view I took of it. In reply I wrote this letter: "July 3rd, 1867. Mr. Wm. Dron-" field, Randal Street, Highfield, Sheffield. Sir,—Yours " of yesterday to hand with memorandum inclosed, " which I will take the first opportunity of laying before " the proper parties, some of whom are now from home." I wrote him again on July the 11th: " Dr. sir,—In " further reply to yours of the 2nd instant enclosing " memorandum, I beg to say that having laid them " before the coalmasters as promised they refuse to " entertain the matter in any way whatever." This, I think, goes to show that this is strictly a union movement, and the support that the men have been having I believe is out of Lancashire. I had also a deputation from Lancashire. Allen, I think it was, came and said that he was a representative of a large number of miners, and also large funds to the extent of some 10,000*l.*, and they should bring it to bear if we did not make some concession to the union men; but I did not feel inclined, nor was I deputed by the masters to do so; and I believe if it were given way to it would not be possible to work our district under their rule and domination. Consequently, I told them I thought as an individual that there was no chance, and I suppose we have had to bear the weight of the three unions.

12,367. (*Mr. Mathews.*) Is it your impression that if these unions prescribed their own rules and had their own way as to getting the coal, the cost of getting the coal would be increased materially?—I would not accept of any colliery in the district on those terms. To show the difficulties that we have to contend with, here are some rough sketches (*producing the same*), showing the nature of our work, and if we had to go to the men to have a council, and the agents and proprietors had to wait for their decision to know what was to be done in the working of this coal we should be always at bay and our works would be stopped. A colliery is completely intersected with these things (*pointing to a sketch*). It is not like a level plain, and that would all be subject to the dictation of men who would very likely know nothing about the district. That is another section (*producing the same*).

12,368. You produce these sections to show the Commission that you have not only the ordinary difficulties of coalmasters to contend with, but peculiar difficulties in your own colliery?—Yes, and we have difficulties in our district through the spontaneous combustion of our mines.

12,369. (*Mr. Roebuck.*) I think you use the phrase "fiery mines," do not you, to signify that class of mines in which combustion takes place in that way?—The fiery mines contain a large amount of gas that is inflammatory, but combustible mines are those that ignite themselves.

12,370. (*Mr. Merivale.*) What is the rock from which you have to cut this proposed incline from one seam to the other (*pointing to the sketch*), is it limestone?—Part of it would be stone, part of it would be bind or soft strata, and the other clay; you could not cut six yards there but that it would vary in its quality, and it must be left to a practical man on the spot to manage it, and he cannot work his colliery unless he keeps up a good understanding with his workmen.

12,371. (*Mr. Mathews.*) All collieries have difficulties of that sort, faults and dislocations more or less?—Yes, and without a good understanding being kept up between the employers and the employed, it would be impossible to go on, and I do not think that a third person however wise can have the necessary knowledge.

12,372. You think that in your case you have more than the usual allowance of difficulties?—Yes. At the side of every one of those faults there would be a fire, and one of the arguments used by the delegates in their advice was that if they could only stay out a week or two our pits would be all on fire, and we should be compelled to shut them up.

12,373. (*Mr. Roebuck.*) I think you said that the delegates used the phrase "If you do not make conces-" sions to your workmen." They never asked you to make any concession, I think, excepting that one, that they should join the union?—I think when that suggestion says that the men should pledge themselves not to make any demands for 12 months it presupposes that something should be done then. Mr. Brown told them that they should ask for 10 hours first and then for 8 hours, and that every man should have a shilling an hour who went down in the pit whatever he did.

12,374. (*Mr. Merivale.*) Were these demands made to you?—They were said in the hearing of the men.

12,375. (*Mr. Mathews.*) The liability to spontaneous combustion would be greater in a colliery of your sort than in ordinary collieries?—Yes.

12,376. And you think that if the union were to frame regulations to supersede your regulations for the safety of the colliery you must close it?—Yes, it would be commercially valueless.

12,377. (*Chairman.*) Do you pay by the day or by the fathom?—Where we can, where the workman knows what strata we are going through, and the agent knows what stratas are before him, he can generally set it by the piece or by the yard, but where that is not the case you must agree with him by the day till it is known.

12,378. (*Mr. Mathews.*) Is there any disinclination to work at piecework?—No. I have been able to keep up an understanding with our men that they will go to piecework or day work as the case may require. I do not bind them to their contract if we find that the work is not what we thought it was when we set it.

12,379. Do the unions discourage piecework?—As far as the effect on the men goes I think they discourage work altogether.

12,380. (*Mr. Merivale.*) Did Brown talk about piecework among the other grievances?—I do not know that he did, except about getting an extra weight per ton. I should explain that it is merely a ready way of reckoning. Every person knows how much he has to get before he commences work, that he has so much for so many hundredweights which are called a ton. It is a perfect understanding with the men in all our accounts. We get 24 cwt. at one colliery and 25 cwt. at another. The reason why I made the difference of the cwt. was this, that there was more waste at one colliery than at the other, and it has a better appearance in book-keeping when you can show that you can sell as many tons as you pay for getting, and if there was not extra weight got in that respect it would look as if you were paying for more than you can sell. If we sell 20 cwt. out of the 24 cwt. we are satisfied.

12,381. (*Mr. Mathews.*) Whatever regulations you make for the weight that you sell the men clearly understand the regulations as established as to weight betwixt you and them as to the quantity they are paid for?—Yes, that is a strict understanding when they commence work, that they get so many hundredweights for so much money.

12,382. And if they were to say, " We will not con-" sent to get so many hundredweights for a ton, " whereas formerly we got 24 hundredweight," you reduce their wages?—Yes, supposing it amounted to a penny a cwt. it would be 1*s.* 8*d.* a ton instead of 2*s.*

12,383. (*Chairman.*) What evidence have you to offer with regard to intimidations?—I have had a list of the intimidations we have had to deal with that have come under my notice and that of other people in the district. On July 12th William Smith was convicted for an assault with intimidation on William Pickering—one month's imprisonment. October 22d, Jonas Hooper was convicted by the Swadlincote bench of magistrates for intimidation—one month's imprisonment. November 21st, William

Mr. W. Eley.
24 March 1868.

Harris was convicted for intimidating John Sidwell—sent to gaol for seven days. George Chamberlain convicted for intimidating John Sidwell—sent to gaol for seven days. Abraham Bateman, convicted for an assault and intimidation—six weeks' imprisonment. John Holdman, convicted for assault and intimidation—six weeks' imprisonment. Charles Bass, convicted for assault and intimidation—six weeks' imprisonment. William Swain, convicted for intimidating Thomas Mousley—three months' imprisonment. Edward Swain, convicted for intimidating Thomas Mousley—three months' imprisonment. November 21st, Thomas Wilkinson, convicted for assaulting Patrick Hinds, with intimidation—one month's imprisonment. William Radford, convicted for assaulting Edward Lee, with intimidation—three months' imprisonment. (I think that those were not referred to by Mr. Gleadow.) Also on the 21st, one square of glass broken by a stone in Thomas Twiggs's house at Newhall. Two windows were smashed in at Hall and Boardman's house in Newhall—not detected. In December three squares of glass broken by stones in Francis Buxton's house at Newhall—not detected. John Hoult, for assaulting Wardle—convicted and sent to gaol for 14 days. January 15th, 1868, eight squares of glass were broken in the windows of the house occupied by Joseph Smith on Gresley Freehold, stones and brick ends were thrown into the house—a reward of 10 guineas was offered, but the offenders were not discovered. Eight squares of glass broken in the windows of the house occupied by George Brealey at Newhall—the offenders were not detected. On January the 16th, a brickbat was thrown through John Adey's window at Church Gresley—two squares of glass were broken, and Mrs. Adey was struck by the brickbat—a reward of 11 guineas was offered, but the perpetrator was not discovered. On the 17th, as the workmen from Cadley Hill colliery were returning home to Cauldwell and Rosliston, a number of union men appeared on Cadley Hill railway bridge and threw down a quantity of large stones, tools, shovels, mattocks, &c., upon them as they passed under the bridge. Some of those stones were 6 or 8 lbs. weight, boulders which evidently must have been carried some distance as there were no such stones as those lying in the immediate neighbourhood. On the 20th, as the workmen above named were returning home a number of union men came out of a shed between Cadley Hill and Cauldwell and threw stones and brickbats after them and pursued them into Cauldwell village, a distance of two or three miles. On the 24th, shortly after 6 o'clock in the evening, a number of persons attacked and violently assaulted and beat with sticks and stones Thomas Lea, of Church Gresley, collier. A reward of 20 guineas was offered for each and every person committed, but they were not discovered. On February the 12th, William Sales's windows broken. Four squares of glass broken in Joseph Billings's windows at Newhall. Six squares of glass broken in in John Lawrence's window at Newhall. On March the 13th, Samuel Whittaker's windows broken. A large number of union men assembled in the Market Place, Swadlincote, at 7 o'clock in the evening. It was a dark night and they were armed with formidable sticks, &c. A stone was thrown through Charles Goodwin's window. (Goodwin is a collier in work.) Another stone was thrown through the window of Mr. Faulkner at the Granville Arms Inn. They then proceeded along the street and sent a stone through the windows of one of Hall and Boardman's houses. They then proceeded to Catchem's Inn, and literally smashed in the windows of the toll-bar house and an adjacent house. The furniture and a quantity of pots were broken, the floors of the house being strewn with stones, brickbats, broken crockery, &c. On the 14th, William Sales's door broken open; and on the 18th, William Sales's windows were broken for the third time. Those cases have come under my immediate notice; and I may say that on one occasion a person was nearly beaten to death under my own windows. He woke me by his groans. I thought it might be a ruse to get me out. I watched the man till he got up and staggered to his lodgings. and he was brutally beaten, and I do not know when I have seen a man's face so literally cut to pieces. Richard Bunting, one of the delegates before alluded to, was brought before the county bench of magistrates at Derby, on 28th of February, and was committed for trial for attempting to bribe a police officer named James Newton (who was stationed at our colliery), on the 15th of January, by giving to him ten shillings, and also giving him money at other times, and requesting him to neglect his duty and to take no notice of the union men who wanted to "pull a job off" at our colliery. After a patient hearing at the March Derbyshire Assizes the case was dismissed by the jury.

12,384. (*Mr. Mathews.*) Was there any conviction n that case?—They could not get the perpetrators, We had special constables sworn in at the time. and they were very efficient guards. The magistrates swore a number of our workmen in and they have been of great service to us, inasmuch as I find that the men have a greater dread of recognition than of the county constabulary. I have had as many as 25 of the constabulary in the morning with 30 special constables, and they used to billet the constabulary off in different quarters, taking a few specials for recognition, and the men dread those men more than they do the county constabulary, because if the constabulary do not exactly catch the men they do not know them, and the men take advantage of that. One man from the village acting as a special constable with the policemen is a greater safeguard for that reason than a great number of the other police.

12,385. Because he has a greater knowledge of the men?—Yes; I may state that I have not thought it safe for me to pass out of my house for the last eight months without having a revolver in my pocket.

12,386. Have you shown it?—On one occasion, when I was surrounded by 80 men, I told them that I had such a thing with me and that I hoped they would not have recourse to any brutal force. "If you do," I said, "you may possibly find that you may be "taken in; and I wish you to understand that the "police go out with staves and they have strict "orders." We have impressed forbearance on the minds of the constables and the constabulary, and I can testify to their forbearance, although they have knocked their hats on one side with a tin kettle or brushed it off. The forbearance that has been shown by the police and specials to these men has been of great service in keeping the peace, or I do not know what the disasters might have been.

12,387. (*Mr. Booth.*) Do the special constables become marked men?—I do not think that they are more marked than any other man that goes to work; any man that is known to be at work is in danger of being molested.

12,388. (*Chairman.*) The unionists that come over are strangers to the workmen that work in the collieries, but they attack them because they work?—Yes.

12,389. It is on account of the difficulty of recognizing who it is that strangers come to you and attack the men working in the collieries?—They have been partly our own men, but we know them all in the district. Some of them are those who have gone out of the neighbouring collieries.

12,390. (*Mr. Merivale.*) Do you mean that the men who have actually committed the assault and beaten others in this brutal way were strangers, or men of the district?—Men of the district.

12,391. (*Chairman.*) Why cannot you identify them?—In those cases they have been identified, or the greater portion of them. But supposing a window was broken; if you saw 20 men there, unless you can swear that you saw one person that threw a stone there is difficulty in getting a conviction. And there has been great difficulty in these cases, especially when they have occurred in the dark. I thought at one time our colliery would have had to stop through intimidation and fear. The men seemed in fear of

turning out at all, and had we not been at the expense of sending men to fetch them to work and take them from work they would not have come.

12,392. (*Sir D. Gooch.*) Did they not molest the men on coming home?—No, but their windows have been broken.

12,393. (*Mr. Merivale.*) What sort of men did you hire to act as guard?—We took our men out of the workshops.

12,394. (*Lord Elcho.*) Do you know where Brown is now?—I do not.

12,395. Have you heard of his doing at other places what you say he has been doing at this place?—He has just done in our district. No doubt we shall hear of him again, and you may depend on one thing, that he will pitch on some place where prosperity prevails.

12,396. Do you know where his head-quarters are?—Nottingham.

12,397. Is he a native of Nottingham?—His address is there. He did write to me once from Queen's Chambers, Nottingham.

12,398. What is he?—He is an agitator.

12,399. Was he brought up to any trade before he took to agitation?—I cannot say positively, but I understand that he was a greengrocer for some time. I may say that he stated that he intended to build a wall from North Derbyshire into Warwickshire, round by Leicestershire and Nottinghamshire, and to enclose us in that large wall he was going to build. He was going to take us all in rotation.

12,400. (*Chairman.*) I do not understand what the wall typified?—He said that he was looking after bricks, and he called those men who joined the union hard burnt bricks, and he said that he wanted to build a wall with these hard burnt bricks all round those counties. I should like to make one statement in reference to wages to show that in our district it is not essential to have unions to regulate the price of wages. Although we have not had a strike or had a word about the union in our district the wages have advanced in our district from 1*s.* 6*d.* to 1*s.* 8*d.* a day.

12,401. (*Mr. Merivale.*) When?—During the 20 years we have had peace.

12,402. (*Mr. Roebuck.*) And are the wages in your district where there had been no unions less than the wages in those districts in which the unions existed?—I believe we should be able to compare our wages, taking the amount of work done, against any county in England.

12,403. (*Mr. Merivale.*) Do you mean that the whole advance that has been made in the last 20 years is from 1*s.* 6*d.* to 1*s.* 8*d.* a day?—For picked men wages have increased by 1*s.* 6*d.* or 1*s.* 8*d.*

12,404. What has been the advance in rents during that time?—I am not aware there has been any advance in rents. Twenty years ago I could have picked the whole district at 3*s.* 4*d.* per day, and now I could not get the same men for the same work under 5*s.* per day, and this has been done without any strike or any dictation.

12,405. (*Mr. Roebuck.*) Or any quarrelling?—Or any quarrelling; nor have they played a day on account of any dispute, but there has been a mutual understanding between employers and employed, and the employers have been willing to give the fair market price.*

12,406. (*Chairman.*) I think the second resolution in the memorandum which the delegates' committee left with you was, that the terms that should be mutually agreed upon between employers and workmen should not be departed from during a twelvemonth without mutual consent. What was the meaning of terms "that should be mutually agreed on"?—I do not know what the views of the delegates were on the subject.

12,407. You had an interview with them, I think you said?—Yes, I had an interview with them, and Mr. Normansell was one, and they came to this conclusion, that had they had the union set forth in the same way as we have had in our district they would have acted in the same way as we have done.

12,408. My question was as to what they meant by "terms mutually agreed on." Was it that you should fix for a twelvemonth with the men the way in which your colliery should be worked?—I think the views of the delegates were these, from what I could gain of them, that they thought of establishing a sort of council chamber in our district, so that the men could appeal to them and we should have had to work our collieries under their dictation.

12,409. (*Mr. Hughes.*) But they did not propose, did they, that this board or council, or whatever it was, should be composed of workmen?—I really never understood their proposition at all. I am one who believes that the intervention of a third party would be mischievous to either side.

* The witness subsequently added the following statement:—"At our own two collieries we paid near 6,000*l.* less in wages "during the year the strike was in operation than in the pre- "vious year; and we had a new colliery ready to be opened "out, but the strike has prevented it for the present, or we "should have paid a much larger amount in wages. There are "five other collieries here which would be equally affected, "and a general depression of trade being caused in the neigh- "bourhood, there would be a large deficiency also in the amount "of wages paid by manufacturers."

The witness withdrew.

Mr. Arthur Higginson examined.

12,410. (*Chairman.*) What are you?—I am partner in the firm of I. and N. Nadin & Company, Stanton Colliery, near Burton-on-Trent, in Derbyshire.

12,411. Are the Gresley Wood and Swadlincote and Cadley Hill collieries that we have been hearing of all neighbouring collieries in the district?—Yes, all neighbouring collieries. There are eight altogether, worked by six firms, within a few miles.

12,412. Is the coal subject to the same incidents as to fire-damp and spontaneous combustion?—Yes.

12,413. (*Lord Elcho*). What is the general name for that district?—South Derbyshire.

Mr. Eley. If you will take a mile radius from Swadlincote that will include all the collieries mentioned.

12,414. (*Chairman to the witness.*) Have you been troubled lately with unions?—In precisely the same way as the other witnesses. We have had no dispute whatever with our men; they have made no demand upon us, up to the time that Brown and these other agents came into the district.

12,415. Have you been as man and man, having some fellow-feeling and liking towards your fellow mortals?—Yes, the men have worked with us from my grandfather's time and downwards without any ill feeling whatever.

12,416. As far as you knew by their countenance and voice they had friendly feelings towards you?—The most friendly feelings possible.

12,417. Did you ever speak to them in a friendly way. In some concerns the master never speaks except to give commands, but if you were on very friendly terms you would inquire for their families, and have some acquaintance with them?—Yes, we had known them all their lives and grown up together.

12,418. Then delegates came down into that district such as have been described before?—Yes, shortly after the Staveley business was over and the strike at Hucknall colliery, the same men employed in that district as delegates came into ours. I have here some balance sheets sent to me showing the amounts they received in the Derbyshire and Nottinghamshire Miners' Association, and the same men named here, with some few exceptions, are the men who have been troubling our district since. In that union they give each member a book of this description (*handing in a book*) when he joins the union, and the first date

Mr. A. Higginson.

24 March 1868.

is January 1866. They did not come into our district till February 1867. I produce that simply to show that it is a branch of the same association—that these men who receive that money are dependent for their livelihood upon continued agitation in some district or other. These are fortnightly balance sheets. This is the balance sheet for January 31st, 1867 (*producing the same*), in which I find these payments to agents: "William Ball, 3*l.* 19*s.* 0½*d.*; R. Bunting, 4*l.* 13*s.* 0*d.*; H. Clarke, 4*l.* 1*s.* 3*d.*; William Brown, 6*l.* 16*s.* 7½*d.*"

12,419. (*Lord Elcho.*) Is that *the* Brown?—Yes. In the next fortnightly account I find the following sums entered as paid to the same agents: "H. Clarke, 4*l.* 7*s.* 0*d.*; W. Ball, 4*l.* 3*s.* 9*d.*; J. Lee (omitted last time), 3*l.* 19*s.* 11*d.*; J. Lee, 4*l.* 1*s.* 11*d.*; R. Bunting, 4*l.* 5*s.* 9*d.*; W. Brown, on account, 3*l.* 3*s.* 7*d.*" and then for the fortnight ending February 28, "J. Lee, 4*l.* 3*s.* 10*d.*; W. Ball, 4*l.* 0*s.* 2*d.*; R. Bunting, 3*l.* 16*s.* 3*d.*; H. Clarke, 4*l.* 5*s.* 10*d.*; W. Ward, 8*l.* 6*s.* 5*d.*; W. Brown, 9*l.* 2*s.* 4*d.*"

12,420. (*Mr. Mathews.*) Are these all officers of the union?—Yes; they are entered here as delegates.

12,421. (*Lord Elcho.*) Do you know at all where William Brown spent that last fortnight, and can you say whether his work had been much greater during that last fortnight than the first, because his wages appear to have risen 3*l.*, I see, in the last as compared with the first?—I do not know. Then appended to this there is the agent's plan, giving a list of the places where they are to go on certain days.

12,422. (*Chairman.*) If agents get men to join the union the income of the union is increased thereby. Is a shilling a week what men joining the union would pay?—I believe that is the case in our district.

12,423. Is there any rule that the agents that go round have a per-centage upon the number of men that they induce to join?—I should think not. I have no reason for thinking so.

12,424. Why is Brown paid 6*l.* one fortnight and 9*l.* the next?—I am sure I cannot say.

12,425. What account is that from which you have been reading?—It was sent to me through the post. It professes to be the Derbyshire and Nottinghamshire Miners' Association balance sheet. There is first of all the balance sheet, then the agent's plan, and then minutes of the council meeting held at Chesterfield.

12,426. (*Mr. Roebuck.*) I suppose some traitor sent it to you?—I imagine so.

12,427. (*Mr. Merivale.*) That is the union with which you have had to do?—Yes; they attempted to introduce a branch of this union into our district.

12,428. (*Lord Elcho.*) Have you any reason to doubt the accuracy of that balance sheet?—No, it was published in the district, and has not been contradicted. I have published it in the form of a hand bill.

12,429. (*Mr. Booth.*) Are the items in print?—Yes, I have been reading from printed sheets.

12,430. (*Chairman.*) All the unions have fortnightly or monthly accounts, have they not?—They have not issued any balance sheets such as those since they came into our district, but I imagine they have such accounts. I have never heard of one being seen by any one of the men that have come back to work at our works.

12,431. (*Lord Elcho.*) With regard to that account in which Brown's name appeared, the payment to him was not for work done in your district?—No, not for South Derbyshire, for North Derbyshire.

12,432. (*Chairman.*) The same men were at Staveley I think who came to you?—Yes.

12,433. (*Mr. Mathews.*) Do you attribute the disturbances in your colliery to the fact of the Staveley union men coming into your neighbourhood?—To the delegates coming.

12,434. Did any number of men refused employment at the Staveley colliery come to seek employment at your colliery?—I am not aware of any.

12,435. Your observation applies to the delegates entirely?—Yes.

12,436. (*Chairman.*) Will you state the result upon your colliery; did Mr. Brown address your men?—He addressed the men generally in the district, and also held meetings in the village where most of our men lived.

12,437. And did you hear any of his addresses?—No, I never heard him speak.

12,438. (*Mr. Mathews.*) Have you had any personal intercourse with the officers of the union yourself?—Yes, I have had a call from two of the members of the union. We had refused to see the delegates.

12,439. Then you have had intercourse with the union?—One interview, on February 14th, Mr. Halliday, Miners' Agent, of Little Lever, Bolton, and Mr. Dronfield, of the Trades Alliance Association, called on myself and partners; that was the only interview.

12,440. What was the result?—They said, "We "wished to know the masters' view of the case." We talked about it for an hour or two, and I think we satisfied them; in fact they admitted that the men had no grievances, they merely wished their union to be established. We said that our determination was not to employ union men. They admitted that we had a right to say that, but that was when the district was almost exhausted through loss of trade and the thing just at an end. There is one case near Burton where we supplied coal to a brewery and they have been obliged to go elsewhere.

12,441. (*Chairman.*) About how many tons per fortnight did you supply them with?—I should think our bill would be about 150*l.* a month; something of that sort; it is not one of the largest breweries.

12,442. (*Mr. Mathews.*) Whose brewery is it?—The Burton Brewery Company's.

12,443. Are your men out on strike now?—No; at least there are some men still out that we have no employment for owing to their having driven trade away, and trade being slack now, Brown being gone, last week they received no pay at all, and he announced, I believe, that unless they sent for him they would not see him again, and the men are in many cases almost starving.

12,444. There was no question of wages in the matter?—No, it was simply a question of union or no union.

12,445. Before the introduction of the union into your neighbourhood there was the fullest intercourse between you and your men?—Yes.

12,446. And no obstacles intervening between you?—No.

12,447. And now you find that there are obstacles intervening?—I think it is over now. For the 12 months that it lasted when I had to ride through the district I was always hooted.

11,448. (*Chairman.*) Now are you?—Not now.

12,449. (*Sir D. Gooch.*) They have changed their demeanour now?—Very much. Everything is done to order. For a long time I was hooted as a "black-leg." All at once I was saluted as a "funny-eye." I inquired why that was, and I found that Brown had told them that "black-leg had become stale."

12,450. (*Chairman.*) Have the different words a meaning?—The black-legs are the men who stick to work. But now they are very civil to me.

12,451. (*Mr. Mathews.*) No difficulty now exists in the way of resuming the ordinary relation between you and your men?—No; I think 40 or 50 of these misguided men came to the colliery last week to say that they had seen the folly of their conduct—in fact, they were literally starving, and are now applying to the Burton workhouse for relief.

12,452. (*Mr. Roebuck.*) Were there many instances of violence or intimidation during that twelvemonth.—Very many. I have a list here of men who were convicted before the magistrate. I may say that I think I was present at all the cases. The first case that arose on which any action was taken, or the first with the exception of one, was at Lord Chesterfield's colliery. He introduced a number of men from South Staffordshire—that was in the latter end of September. I happened to go to Burton on the 1st of October,

and saw the disturbance. The whole road was lined for two or three miles with pickets armed with sticks and stones. Jonas Hooper, who was a delegate, and one of the leading men, evidence having been got against him, was brought before the magistrates shortly after, and sent to prison for one month. He appealed to the sessions, and at the sessions the masters, through a mistaken view, I think, as it turned out, agreed to compromise the question, and he was set at large on his undertaking not to offend again; but he did, and was brought up on a subsequent occasion.

12,453. (*Chairman.*) You say he was a delegate ?—Yes, not a foreign one but a home-made delegate; one of the leading men from the first. That was on the 7th of October. The offence charged against him was preventing persons from working by molesting.

12,454. Do you remember what was the form of molestation that they used against that man ?—It was hindering the man and taking him by the collar, and saying, "Do not go to work, do not take bread out "of our mouths, we will pay you your fare back," and acting with a mob of 200 or 300 men at the time.

12,455. He laid his hand upon the man and hindered him ?—Yes; there has been a great difficulty in our district in connecting the molestation with the purpose of making them leave their work, and the evidence has failed in one or two cases, but in that case it was clearly proved. Then on the 19th of November 10 men were brought up, and sentenced to various periods from ten days to three months.

12,456. Was it for obstruction ?—"George Cham- "berlain and William Harris, preventing persons "working by threats—seven days hard labour. P.S. "There was also another charge against these two "defendants but the case was withdrawn." The masters did not press it. "Abraham Bateman and "John Oldham, preventing persons working by mo- "lesting—six weeks' hard labour; Charles Bass, pre- 'venting persons working by force—six weeks' "hard labour; Thomas Wilkinson, preventing per- "sons working by force—one month; William "Radford and Edward Carter, preventing persons "working by violence, Radford three months and "Carter discharged; William Swain and Edward "Swain, preventing persons working by threats, "three months' hard labour." On the 4th of February 1868, James Hooper, the same man, was again brought up for preventing persons working by molesting, and the case was dismissed, and he was also brought up for assault, and the case of assault was dismissed. They brought a large number of men who were in the procession who swore that he did not do what two witnesses swore he did do, and the magistrate gave him the benefit of the doubt. On the 4th November 1867 Herbert Newberry and William Herbert, for assault, got two months hard labour; William Schreeve and John Potter, for stealing coal (they were union men), had one month's hard labour. There are also, during that twelve months, upwards of 230 cases against colliers in the neighbourhood for stealing and so on. That shows the state that the district was brought into.

12,457. (*Mr. Hughes.*) When you say that it shows the state that the district was brought into, the initiative was taken by the masters, was it not ?—No.

12,458. There was no action taken until the masters said they would employ no union men ?—They said they would employ no men who belonged to the union.

12,459. That was the beginning of it ?—No, the delegates coming into the district.

12,460. But that act of the masters was the first open action ?—Yes.

12,461. (*Mr. Roebuck.*) And that they did on account of the doctrines laid down by the delegates ?—Yes.

12,462. (*Mr. Hughes.*) Were there any masters' meetings to settle what should be done in the district ?—We talked it over in the district.

12,463. And they then determined to take that policy ?—Yes, for this reason, that the policy of the union men is to concentrate their force on one colliery and then go to the next.

12,464. So in fact you thought you would strike first ?—We did not strike first; we thought we would defend ourselves.

12,465. (*Mr. Roebuck.*) They gave you to understand distinctly what they were about ?—Yes.

12,466. And thereupon you took action to defend yourselves ?—Yes.

12,467. (*Mr. Mathews.*) You exercised your privilege of combining too ?—Yes.

12,468. (*Lord Elcho.*) You said that you had an nterview with Mr. Halliday and Mr. Dronfield, and you had an hour or twos talk with them, and they ended by saying that you were justified in not employing union men. When they said that, did they mean that you were free to do so, or that the circumstances justified you in doing so ?—That we were free to do as we like.

12,469. (*Mr. Roebuck.*) This acknowledgment on their part was after the strike was defeated ?—It was on its last legs.

12,470. When, in fact, experience had brought them to their proper senses ?—They found that the game was lost, and they were ready to admit anything.

12,471. (*Chairman.*) To be ready to admit anything that is proved is advice often given in court, perhaps it was something like that ?—Yes, I may say that one day last month, at about half-past 5, I met a number of men mobbing some Staffordshire men who were working for Mr. Gleadow, I interfered, and they stopped. That is what the state of the district has been; they have lived partly upon the funds furnished by the association and partly by begging.

12,472. (*Lord Elcho.*) At the commencement of your interview with these men did they try to make out that you had no right to exercise your discretion in this matter, and that it was an injustice or wrong on your part to confine your employment to non-union men ?—They did not open with that, they said that they had not seen any of the masters, and that they wished to hear the masters' side of the case. I was not aware of the fact at the time, but they had had a large meeting at the People's Hall the night before, and their interview with ourselves was in consequence of the resolution come to at that meeting. I was not aware of that when I saw them.

12,473. (*Chairman.*) I do not understand what purpose was proposed by them in that interview ?—They wished us, if possible, I imagine, to allow the men who had been locked out and struck to come back to their work.

12,474. (*Mr. Roebuck.*) Having failed by violence, they then endeavour to gain their end by persuasion ?—Exactly, when they found that violence would not do. A considerable correspondence had been going on about referring it to arbitration. They made no offer about referring it to arbitration at first.

12,475. What did they want to arbitrate ?—That is what they cannot say. I have asked them that over and over again.

12,476. The real fact is that your determination not to employ union men was the sole grievance of which they had to complain ?—That it was the sole grievance, has been generally admitted; in fact, I can speak for our people, we have had no difference with them.

12,477. These delegates live by agitation ?—I imagine so.

12,478. If the agitation ceased they would starve or work, both of which are disagreeable things to them ?—Yes.

12,479. And therefore your determination not to submit to arbitration, but to manage things in your own way militates against their chance ?—Yes, that was their only chance, that they might get an arbitrator to say that we ought to allow the union men to work for us.

12,480. Did they tell you when they asked you to submit to arbitration how they were to enforce the arbitrator's decision ?—No.

Mr. A. Higginson.

4 March 1868.

12,481. Did they undertake in any way to act for the men or to be answerable for the men?—I almost think that in some correspondence which has been going on between Lord Chesterfield and Mr. Bass it was to be secured by some legal means.

12,482. You, the colliery masters, are a small number well known?—Yes.

12,483. But the men are a large number not known at all?—With some exceptions that is so.

12,484. And therefore you would not come upon equal terms to arbitration with those people?—Certainly not.

The witness withdrew.

Mr. H. C. Briggs.

Mr. Henry Currer Briggs examined.

12,485. (*Chairman.*) Are you of the firm of Messrs. Briggs, Son, and Company, of Whitwood and Methley Junction collieries, near Normanton?—Yes.

12,486. How long have you had the management of that business?—Since about the year 1852. Till the 1st of July 1865 the collieries were conducted under a private enterprise. Since that they have been conducted under the Limited Liability Act of 1862, and we retained about 6,000 shares out of the 9,000 into which it was divided.

12,487. With regard to the 3,000 shares that were left, are those disposed of to any purchaser that chose to buy, or do you dispose of them as you prefer?—I will explain that afterwards—it will come in due course because it brings in the subject of the peculiar system which we have adopted. We employed in 1858 about 500 hands, in 1860 about 700, and now we have 1,300 employed at those works. Our collieries are situated in the West Yorkshire district. The district which is now taken by the West Yorkshire trades union comprises about 40 collieries and 7,000 miners, of whom, according to the speakers at recent meetings, about 2,000 are in the union and 5,000 not in the union. It is the West Yorkshire or Leeds district, not connected with the South Yorkshire district, but separate from it.

12,488. (*Mr. Mathews.*) How many collieries are there in which your men are employed—what number have you in your occupation?—We have three—Whitwood, Haigh Moor, and Methley Junction.

12,489. (*Mr. Hughes.*) When did you begin to have troubles with your people?—The first trouble in the district occurred in the year 1853, at least those were the first since I knew anything of the district. There was a demand made upon Messrs. Pope and Pearsons for an advance of wages. I cannot ascertain exactly the amount of that demand, but it was a considerable advance that was demanded. The men struck work, and the strike lasted for five months. Previous to that date no association of masters had existed in the West Yorkshire district, but on that demand being made they met at Leeds, and they arranged to support Messrs. Pope and Pearson whilst their men were on strike by a monthly contribution. And the unionists on their side supported the men who were on strike at Messrs. Pope and Pearson's colliery. This strike, as I have said, lasted for five months, but there was no strike or lock out that occurred at any other colliery in the district. It was a fair stand-up battle, and I think there was no unfair dealing on either side. At last the price of coals advanced very considerably in the end of the year 1853, and the first month of 1854, and the wages were advanced about 30 per cent. during that time.

12,490. What brought about the end of the strike?—The trade improved very much at the end of that five months, and we gave an advance of wages, and we gave several consecutive advances afterwards, and the price of coal was advanced from about 4*s.* 7*d.* per ton to 6*s.* 8*d.*

12,491. Then in the view of the unionists, I suppose, that was a successful strike on their part; they got the advance which they demanded?—They did, after five months.

12,492. (*Mr. Booth.*) The advance would probably have taken place whether there had been a union or not, I suppose?—I believe it would.

12,493. (*Earl of Lichfield.*) Was it conceded by you in consequence of the pressure put upon you by the men?—No, I do not think it was; it is a long time since, and I do not recollect the exact circumstances, but I believe the advance was given by Messrs. Pope and Pearson, and it was followed by the other masters at the other collieries without any strike.

12,494. (*Mr. Hughes.*) That the unionists would represent, whether rightly or wrongly, as a success on their part?—Yes.

12,495. What was the next case?—From that time up to 1858 there was no special collision at all. In the interim both the miners union and the masters association fell to the ground, or at least they took no action and there was no battle. The market price of coal slightly fell during that period until the early part of 1858, when it had fallen to an average of about 4*s.* 7*d.* to 4*s.* 10*d.*, nearly the old price. In the month of March the employers again met, and they sought relief by reducing wages 15 per cent. (and there was a notice put out to that effect) out of the advance of 30 per cent. which had been given in former years of prosperity. That proposal was resisted and a strike occurred in April 1858 which lasted for 35 weeks. During that period I believe that nearly the whole of the men in the district were in the union. They formed the union at that time. I do not think that there had been actually a union during the intervening time. It had died out, but they made a union at that time in order to resist that attempt to reduce wages, and the men at three collieries turned out, about 800 in number, and were supported by about 2,500 who were working at other collieries. At that time the district was smaller; there were only about 3,500 miners in the Leeds district then.

12,496. (*Earl of Lichfield.*) Then the union formed at that time was not confined to your district?—Yes, it was a separate union, separate from South Yorkshire or any other.

12,497. And was it confined to the district you speak of?—Just to the West Yorkshire district, but the district was rather smaller then, it did not include the collieries round Bradford which are now included in the union district. There were only about 3,500 employed in the district at that time.

12,498. (*Mr. Hughes.*) How did that strike end?—We supported the masters whose men were out and the miners supported the men who were on strike, and it lasted till October 1858, when the whole of the collieries were stopped. The men were locked out in the whole of them in October 1858, the strike having begun in April.

12,499. That was a lock-out of the whole district?—Yes, a lock-out of the whole district in October.

12,500. (*Mr. Harrison.*) By concerted action?—Yes.

12,501. (*Mr. Hughes.*) Bringing things to a crisis?—Yes, bringing things to a crisis. That lasted for two months, when it was compromised by the men for a reduction of 7½ per cent. instead of 15.

12,502. (*Mr. Mathews.*) Had there been a reduction in the price of coal in the meantime?—There had been a reduction previously, nearly to the old standard. In 1853 the price was about 4*s.* 7*d.*, then it advanced to 6*s.* 7*d.*, and then in the end of 1858 it fell to about 4*s.* 7*d.* and to 5*s.*

12,503. (*Sir D. Gooch.*) You had given 30 per cent. increase of wages in the meantime?—Yes.

12,504. (*Mr. Harrison.*) The men had offered 7½ per cent. compromise during the dispute had they not?—No definite offer was made.

12,505. (*Mr. Mathews.*) When you speak of the price of coal you mean the average price?—Yes.

12,506. (*Mr. Harrison.*) Some basis of compromise had been put forward, had there not?—I think there was a meeting of masters and men at Leeds during the continuance of that strike, but there was nothing very definite.

12,507. (*Mr. Hughes.*) At the end of 35 weeks, as I understand you, a compromise was come to by which the men gave up half, and you met them half way?—Yes.

12,508. (*Earl of Lichfield.*) What was the price of coal then and at the time the strike commenced?—The price of coal rather increased during the strike, because it caused a scarcity of coal.

12,509. Was it in consequence of the increase in the price of coal that you conceded the demand?—No, but because the winter was coming on. It is calculated that during that strike there was a loss of wages to the men of 40,000*l.*, which sum would have covered the proposed reduction for two years and the compromised reduction for four years.

12,510. (*Mr. Hughes.*) After that you had peace?—After that we had peace for some time. In March 1859 the coal trade again improved, and the men applied to have given back to them the reduction of 7½ per cent., and it was conceded without a strike, so that the reduction only lasted really from November 1858 to March 1859. During the succeeding five years the miners union was maintained, and there were occasional meetings of the employers, but there was no combined action taken on either side, there was a long peace. But in the meantime there was a demand made in February 1861 for an advance, which was conceded to the extent of 7½ per cent. by the employers without any strike.

12,511. (*Sir D. Gooch.*) Would that make an increase of 37½ per cent. beyond 1853?—Yes.

12,512. (*Mr. Hughes.*) Do you think that the men were fairly entitled to an advance of 37½ according to the trade?—I do not think they were entitled to that last advance.

12,513. (*Mr. Mathews.*) What was the increase in the price of coals in the meantime coincident with the period which we are speaking of?—There was not much increase in the price of coal, but the trade of the district was extended considerably by several railways being opened, and our having more outlets for our coal.

12,514. (*Sir D. Gooch.*) You had the Great Northern open?—Yes, we had the Great Northern open, and other things increased the demand for coal, though the price had not increased.

15,515. (*Mr. Mathews.*) In consequence of the increasing demand you had a larger area of outlets for your coal, and in consequence of that larger area of outlets your common charges were diminished?—Yes, many of the expenses are fixed, being pretty much the same in a large business as in a small one.

12,516. (*Mr. Hughes.*) Should you ever have given that last 7½ per cent. but for the existence of the West Riding Union?—We feared the battle—we did not wish to engage in another battle like the one which we had before, but I believe that it would have been given notwithstanding. There was a great demand for men, a great scarcity of men, and we were all fighting for men at that time.

12,517. (*Mr. Booth.*) It would have been given if the state of the market had allowed it?—I believe it would.

12,518. (*Mr. Mathews.*) The state of the market not allowing it, it was a diminution of your profits?—Certainly, it came out of our pockets. We had frequent stoppages, especially at Methley Junction Colliery at that time. There was one in 1862 which lasted for six weeks, and arose from our desire that the men should separate the large coal from the small. This change, though it gave really an advance of wages for the work done was resisted by the unionists because it was contrary to the usual custom, and the usual rules, but eventually they submitted to the terms proposed. At that time it was a frequent threat on the part of the colliers against any employer who wished to make any alteration in his mode of working, or to interfere in any way with the trade regulations, that they would "set him down," as they termed it, which meant that his colliery should be selected as the one which should be stopped, and that the men working at the other collieries should support those who were on strike.

12,519. (*Mr. Mathews.*) Equivalent to the striking in of a shop in the building trade?—Yes, they took one at once; they thought that we were a bundle of sticks altogether, and they might select one stick at a time.

12,520. (*Mr. Hughes.*) At this time Mr. Henry Briggs, your father, was the chairman of the Masters Association, was he not, he had become chairman in 1862, I think?—I think he was not chairman of the Leeds District Association. He once was of the General Coal Masters Association, but that was in 1844 when there was a great strike.

12,521. That was before the time you remember?—Yes, but I do not remember exactly who was chairman then. There was no real West Riding Masters Association at that time, but they met when there was any special action taken on the part of the men, or when it was thought necessary to have a reduction or an advance in the price of coals. There was not any strict association of the masters, and not any strict association among the miners; the unions were got up just to resist any reduction or maintain any advance almost at a few days notice.

12,522. (*Earl of Lichfield.*) Did the Association of Masters, which you speak of, fix the price of coal from time to time?—They met occasionally to discuss the price of coal. No real price was fixed, but when the trade was very good there were occasional meetings of masters to decide as to whether any advance should take place or not, and to discuss various subjects connected with the trade.

12,523. Did they agree as to the price of coal that it should be a certain price for a time?—Yes, we agreed when there was any advance thought to be obtainable.

12,524. (*Mr. Hughes.*) Then after 1862 what occurred?—The next serious strike that took place was in June 1863, and that arose chiefly from our desire to adopt the riddling of the coal underground. Instead of filling the coal large and small altogether it was to be riddled. The other masters at that time reduced the rate of wages 7½ per cent.; there was a demand for a reduction of 10 per cent., and then it was compromised into 7½ per cent.

12,525. (*Mr. Mathews.*) Would this riddling of the coal underground instead of above ground be an economical process to the coal master?—It was in order to make the men get the coal larger. We had a good demand for the large coal and very little for the small or slack. For every ton we had to draw of slack it was a loss of so much per ton.

12,526. So that it was for the purpose of getting a larger proportion of marketable coal?—Yes.

12,527. (*Mr. Harrison.*) The objection that was made to it was that in many pits it adds to the danger, is not that so?—They said so, but I never could understand how it could add to the danger.

12,528. For instance, where there is danger from the falling in of the roof, the miner is in the habit of listening attentively to any indication of a crack, is he not?—There are plenty of noises in colliery working.

12,529. Let me tell you how it has been put to me. There are certain pits in which the roof is very much in the habit of cracking, and stones and so on coming down. The pitman at work is careful to listen for the least indication of a crack or a fall of the roof. If he is riddling with a sieve and making great noise, he runs the risk of disturbing the wall or roof, and also he cannot hear sounds so well. Do you think that there is anything in that?—It is a most ingenious idea. I never before was able to ascertain what the ground of objection was.

Mr. H. C. Briggs.

24 March 1868.

12,530. I do not know that I state it quite properly, but I have been told over and over again by a great number of people on the men's side of the question that their objection to riddling is not to riddling in all pits, but in some where the danger is of that kind. You do not think that there is anything in that?—Nothing at all, and certainly it did not apply to that colliery. At that very colliery they had riddled until a few months before when there was a considerable demand for slack, and we took out the riddles and we took off the same price that we offered them afterwards to put on when we put the riddles in again. But none of our men ever objected to it on the ground of danger at all.

12,531. What do you think was the objection?—The objection was that it is rather extra work, rather more trouble, and that the men were obliged to get their coal on a system which would produce larger coal. They were obliged to hole under further to get better coal.

12,532. A man was not paid more for the ton of the riddled coal, was he?—Yes, he was paid 1*d.* per ton more; that was what we offered.

12,533. They thought that not enough?—They thought it not enough, but it was what they agreed to at first. They did not like the riddles being put back again at the same advance that they had had before. To proceed with my narrative, the men at the Methley Junction Colliery accepted that compromise of 7½ per cent., and they took the riddles, but they only worked for one day, and then they came out and came to us and said that they found they could not work the coal on that system; and they again stopped, and the men at all the other collieries stopped likewise.

12,534. (*Mr. Hughes.*) What was the end of that?—The end of it was that the strike went on for 20 weeks.

12,535. This was confined to your collieries?—For the greater part of the time it was confined to ours, and to Messrs. Pope and Pearsons. During that one day that the men worked there were only 14 of them that went down out of 93 to try the riddles. Three came out in two hours, 11 stayed for eight hours, and they earned 57*s.* 6*d.*, or an average of 5*s.* 3*d.* for the eight hours work, the lowest of them 2*s.* 11½*d.*, and the highest 7*s.* 11¾*d.* That was the trial which they made of the riddles, and they came to me the following day and said that they had resolved not to work with riddles at any price, and that they should likewise wish men who did not subscribe to the union to be dismissed or compelled to pay.

12,536. (*Mr. Mathews.*) That was dictating to the masters the character of the men whom they should employ?—They attempted it.

12,537. And compelling the masters to be parties to the formation of a union?—Yes. After the continuance of the strike for sometime we took measures to clear our houses and to import colliers from Staffordshire and Derbyshire, who were willing to work the coal on the principle which we wished to adopt. Some hundreds of these men were brought into the district, Then a system of intimidation and bribery commenced on the part of the native unionists which drove back a great part of the men into their own district, and it became necessary to protect the men, and we had a very strong body of police for that purpose. Among others there was a lead miner from Derbyshire who came for some short time; he was assaulted by two men of the name of Poskitt, and they were taken up before the magistrates, and I think they were fined, and the trades union paid the fine and the expenses out of their funds. I think Mr. Pickles paid the money, but he is here now and can give evidence on that subject. He was connected with the union. This culminated in a serious riot which took place at Whitwood on the night of the 24th of September 1863, when the ubiquitous Mr. Brown was very prominent on the scene. He was in our district before he favoured Staveley. The first appearance of Mr. Brown was in 1858. At that time he was employed as a collier at Mr. Fenton's Waterloo colliery, near Leeds.

12,538. (*Sir D. Gooch.*) He was not a greengrocer as has been stated?—No, he became a greengrocer afterwards. I think no one would employ him after the 1858 strike.

12,539. (*Mr. Hughes.*) Was Brown a working collier in 1858?—He was before the strike of 1858 a working collier at Fenton's Waterloo colliery, and, as I say, I think no one would employ him afterwards. Then he became the paid lecturer of the colliers' union, and he lectured at Whitwood on the day of the riot. There were a number of unionists from the neighbouring collieries who attacked the cottages which were occupied by the non-unionists and the house of the colliery steward who used firearms in his defence. For that riot a number of men were committed to York for trial at the assizes, and amongst the number William Brown. Of these men seven were found guilty, and three were sentenced to imprisonment for a period of nine months, whilst Brown was acquitted with a warning from the judge. I have the report of that trial here in the newspaper. It was before Mr. Justice Byles, and his lordship addressed the following remarks to Brown, "You have been "acquitted by the jury, and as far as I can say, "properly acquitted by them; but, Brown, you are "playing with edged tools. That is very dangerous. "I give you credit for your motives, but if you turn "public instructor I should think it safer for you to "instruct them in their duty than in their rights."

12,540. What was the real end of that strike?—I was about to say that on the 13th of October my father received a threatening letter to the effect that we should be shot in 13 days. This is a copy of the letter: "Mr. Briggs I will tell you what i think by "you About this struggle You are getting an ould "man, and besides that, you are a tyrant ould B—— "now sirs, what do you think to that bit. We have "stoped 13 weeks allready, but i have myself sworn "to take your Life and your son also. But you shall "not Live 13 days. Depend on it my nife is sharp, "but my bulits is shorer than the nife, and if i can "under the time i will by God, if it be at noon day "wen i see you shall have the arra if it be in your "charit, Like old Abe. Now reade that and pray to "God to forgive you your sins, to be reddy." He is probably alluding to King Ahab in the 1st Kings 2 chap. verse 34.

12,541. (*Mr. Booth.*) Does he cite the text?—No, we found it afterwards. We could not understand the allusion at first.

12,542. (*Mr. Hughes.*) Did you ever discover who that came from?—No; there was a reward of 20*l.* offered, but we never found it out. I do not lay it really to any of the trades union delegates. I think they were innocent of it, at least all their respectable men.

12,543. Who was the leading man in the strike on the men's side?—There were John Toft, John North, and William Brown. I think John Toft was about as bitter as anyone.

12,544. Was Pickles one?—Pickles did not take a very prominent part. He was living in our houses called the "Common Row," but was not ejected owing to some technical informality in the notice; he was the only unionist left in the row among the "black sheep," as they were called at the time.

12,545. These men with the exception of Brown were all working for you at the time?—Toft was not.

12,546. He is working for you now, is he not?—Yes, he is working for us now. We have all the leading men of that strike now with us, I think, and of all the other strikes as well, nearly. Early in November that strike came to an end by the men accepting the principle of working the coal that we had insisted upon, and promising not to interfere with the non-unionists then at work. That promise, however, was not fulfilled, particularly at Methley Junction, whence all the strangers and non-unionists were speedily driven away by a system of petty persecution,

and several attempts were made to compel us to dismiss non-unionists.

12,547. So that in that strike the men lost all that they contended for; they did not gain anything in fact?—No; the riddles were adopted, and at Methley Junction they went in precisely on the terms we had offered. At Whitwood we adopted a different system altogether. There we began to work endway instead of boardway, in order to make less slack. After that time there were continued stoppages at the collieries. I do not think that we worked a fortnight ever without having a day or two stopped for the most frivolous reasons. There were many stoppages; for example, because the men alleged that we did not weigh the coals properly. Though they appointed a check weigher of their own, still they could not trust to his weighing. They frequently took play days for the most childish reasons; almost any lad coming to the pit and holding up his hand could make a play day. We were met with a blind and unreasoning opposition from the unionists to any proposal that we had to make as to any improvement in the mode of working coal. At last the annoyance came to such a pitch that we resolved to adopt the system of co-operation at the collieries, and we offered to transfer the collieries to a limited liability company, and to admit our workmen and customers as shareholders, we retaining at least two-thirds of the entire capital in our own hands. But we further undertook to recommend to the shareholders, that whenever the divisable profits accruing from the business, after a fair and usual reservation for redemption of capital and other legitimate allowances, exceeded 10 per cent. upon the capital embarked, all those employed by the company as managers, agents, or as workpeople, should receive one-half of such excess profit as a bonus to be distributed amongst them as a per-centage upon their respective earnings during the year in which such profit should have accrued.

12,548. (*Chairman.*) That was to go not only to the officers but to the workmen?—Yes, workmen and officers, all taken indiscriminately, all employed by the company.

12,549. (*Mr. Mathews.*) Was there any stipulation that in the event of the profits being less than 10 per cent. there should be any drawback?—No. It was done on this principle, that we were just as entitled to the 10 per cent. as our workpeople were entitled to the average rate of wages in the district. That if by mutual co-operation we could make more than that the excess should be equally divided between the workmen and the shareholders. If we could make 14 per cent. there would be 10 per cent. first of the initial profit on capital; there should then be 2 per cent. further to capital, and then 2 per cent. appropriated to the fund, as a bonus on the men's labour, and that that should be distributed at a per-centage.

12,550. But were the wages paid to your workpeople on the same scale and the same relative amount as the ordinary wages of the district?—Just the same, as nearly as possible, on the average.

12,551. So that in the event of your men being paid the ordinary wages of the district and the colliery getting more than 10 per cent. there was an addition to their wages to that extent?—Yes.

12,552. (*Mr. Booth.*) Were their wages fixed, or did they vary with the rate of wages in the neighbourhood?—Yes, they varied either up or down with the rate of wages in the neighbourhood.

12,553. (*Mr. Roebuck.*) And I suppose the labourers were satisfied with your wages?—Yes, we have had no special dispute during the time the plan was adopted.

12,554. During the operation of this plan has there been any dispute about wages?—No strike. We have made two advances.

12,555. How were they brought about?—The advance was given at some of the adjoining collieries, and when we found that it was general throughout the district we gave it.

12,556. Did you initiate the proceedings?—No, we did not initiate the proceedings. After it had become general at one colliery the men at one of our pits asked us to give the same. The men at the other pit did not ask us, because they said that they were satisfied that we would do it as soon as it became general.

12,557. (*Sir D. Gooch.*) Had these men taken up shares?—They had taken up a certain number. My brother, the secretary of the company, has some statistics showing exactly the number that were taken up, which he will be able to give you when I have finished. Many of those details have come under his notice as to the number of shares taken by the men, and the number of shares taken by unionists, and the number of shares taken by non-unionists, which last is rather interesting.

12,558. (*Mr. Mathews.*) The broad principle which you laid down is this, you gave the men the same rate of wages as prevailed at the neighbouring collieries, and in addition to that you gave them a participation in the profits above 10 per cent.?—Yes, I was led to fix that figure for this reason—During the previous years we had had so much trouble with strikes that we never had had 10 per cent., except for one year, on our capital, and during two years we had only had five. I thought that if we could make more than that by working mutually together it would be only a fair thing to give the men a proportion of what was realized, and I was led to come to that view by several considerations. The first was that the miners seemed under the ordinary system to become so utterly reckless as to what loss they inflicted upon us and upon a proportion of their fellow-workmen by the neglect of their work and the stoppage of the whole establishment for the most frivolous and childish reasons. Secondly, I believed that some of the more intelligent and influential of our workmen, although strong unionists, and hitherto our bitter opponents, might in time be led by reasoning and experience to see the suicidal character of the late struggles, and eventually to help in civilising the mass of colliers, and raising them to a juster appreciation of their duties as well as their true interests. Thirdly, that no less than 70 per cent. of the cost of raising coal consists in wages paid for manual labour, whilst a further 15 per cent. arises from the cost of various stores and materials, such as wood, iron, oil, &c., in which the workmen have ample power of saving by careful and economical use. We therefore thought that if we could get our men to work thoroughly with us we could easily save, with their extra care, sufficient to pay a considerable dividend on our capital. I knew that they had the power to throw away nearly the whole of our profits by careless working and indifference to our interests, but if we could show them that our interests and theirs were identical, I thought we might save a considerable sum, which it was only fair to give them a portion of.

12,559. How long has this arrangement subsisted?—We began on the 1st of July 1865. We made up our books to the 30th of June in each year.

12,560. Has not the coal trade been exceptionally good during that time?—It has.

12,561. (*Mr. Roebuck.*) Have you made more than 10 per cent.?—We have. During the first year's working we paid 12 per cent. to our shareholders, as well as putting 2 per cent. to the fund for the payment of bonus or labour. In the second year we paid 13 per cent., and 3 per cent. was devoted to the bonus.

12,562. (*Mr. Mathews.*) What quantity of coal do you raise?—Now from 7,000 to 8,000 tons a week.

12,563. So that a difference of a shilling a ton in the price of coal would make 20,000*l.* a year difference to you?—Yes.

12,564. And 20,000*l.* a year from your profits would make a serious difference?—Yes.

12,565. (*Mr. Booth.*) Do the men who are shareholders consent to take your statement of what the profit has been, or is there an inspection on their part of the accounts?—No inspection, except that the colliery is carried on now under the Limited Liability Act. We have an auditor to satisfy people generally.

Mr. H. C. Briggs.

24 March 1868.

12,566. (*Mr. Mathews.*) Have the men any choice in the appointment of that auditor?—No, none, except as their votes as shareholders go.

12,567. (*Mr. Booth.*) By whom are the book-keepers appointed?—By ourselves; we retain the entire management of the concern—that is the same as it was before. According to the articles of association there is a vote given for every share, and therefore so long as we retain two-thirds we have a full control in the management.

12,568. (*Mr. Roebuck.*) I suppose the working men are not capable or educated enough to understand your books?—Some of them are very intelligent.

12,569. Intelligent they may be, but we want technical education to understand book-keeping?—I have endeavoured as much as I could to educate the men up to taking a part in the management. There was a committee of theirs started, which I and my brother met occasionally to obtain suggestions from our men as to any improvement they thought they might adopt in the mode of working coal.

12,570. Has any question about the keeping of the books ever been put to you?—No; I do not remember any.

12,571. (*Mr. Harrison.*) When the company was started, and the nominal capital was fixed, was it fixed upon a valuation of the pit and plant taken expressly for that purpose or was it based upon the valuation which you had had previously?—We took it exactly as it stood in our books; that is to say, we took the amount of the capital which we had exactly as it stood in the books of the firm.

12,572. It had been standing some time?—We bought an additional colliery in 1860, and we took in some partners then, when a fresh valuation was made; that was five years before.

12,573. During those five years there had been no material addition to the value of the plant, had there?—There had been a considerable addition, but in the mode in which we had taken it we had taken off a certain amount for depreciation and added a certain amount for new stock.

12,574. The valuation was based on the old valuations, with corrections up to that date?—Yes.

12,575. (*Mr. Roebuck.*) But you never heard any complaint of your mode of establishing the value of your property, did you?—Never; in fact, our shares are now at a considerable premium. Our 10*l.* shares are now about 14*l.* 10*s.* in the market.

12,576. (*Mr. Mathews.*) What has been the recent reduction in the price of coal?—6*d.* and 9*d.* has been the average reduction during this last month.

12,577. Then it has not fallen so much in your case as in Lancashire or Wales?—No.

12,578. (*Mr. Harrison.*) My question pointed to this, that in comparing the profit of the later years with the profit of the preceding years, which you say shows a difference of nearly double in favour of the present system, you were comparing the identical plant and pits and an identical nominal capital with a slight modification?—Yes, the same capital.

12,579. (*Mr. Hughes.*) Assuming that your capital at the time when the estate was converted, was 90,000*l.*, you had been reckoning for the two previous years, in which you only paid five per cent. on the same capital?—Our capital was 75,000*l.* in 1860, and when we transferred the estate to the company it was increased to 86,000*l.*

12,580. You say that during the two years before the conversion you paid five per cent., and in the two years since you have paid upwards of 10 per cent.; you are calculating on the same capital?—No, on a larger capital.

12,581. (*Mr. Harrison.*) To explain that difference of 10,000*l.*—had 10,000*l.* more been sunk in the pit?—A certain amount of profits have been re-invested in increasing the plant, so that the capital which we reckoned on when we adopted the limited liability system was larger than it was when we conducted a private partnership.

12,582. (*Mr Roebuck.*) Has this plan been adopted by anybody else?—By Fox, Head, and Company in the iron trade, and by Greening and Company in Manchester. It has been adopted in the Sabden Mills Cotton Company, but that company has not got into full operation.

12,583. (*Mr. Mathews.*) Can you tell me the result of Messrs. Fox, Head, and Company's operation?—The iron trade has been very bad, and I heard the other day that they had given in a report that their profit did not amount to 10 per cent., and they have not given anything to the workmen.

12,584. They did not call upon the workmen to contribute anything, did they?—No.

12,585. (*Earl of Lichfield.*) How do you arrive at what you speak of as the standard of wages, upon what your arrangement with your men really is based?—At the time that we adopted the principle the men were satisfied that we were paying about the same as the neighbouring collieries; that if there had been any advance, say of 7½ per cent., in the neighbouring collieries, we had given an advance of 7½ per cent. also.

12,586. (*Mr. Roebuck.*) How is such an advance brought to your notice?—We hear it constantly talked of.

12,587. Do the workmen come to you and tell you?—Yes, they are ready enough to come to us then.

12,588. (*Mr. Hughes.*) Would not you hear of it through the committee of the men?—It is talked of generally; it soon goes through the district, in a few hours.

12,589. (*Mr. Mathews.*) Does your experience as a coal master in that district enable you to state that for the last 20 years the average of the collieries have made more than 10 per cent. upon the capital?—I do not think they have.

12,590. So that if this system were extended and adopted throughout Yorkshire, from former experience you would say that nothing would come out of it in the shape of increased wages?—I do not think so. Since the year 1855 we only paid 10 per cent. for one year.

12,591. So that the mere fact of your having paid an additional sum to wages beyond the 10 per cent. is rather exceptional than general?—I think so.

12,592. So that if you were to convert all the collieries into a limited liability company, the workmen could not rely upon ordinary chances on any great addition?—I think not, unless they worked with greater care.

12,593. (*Earl of Lichfield.*) What do you apprehend would be the effect upon the rate of wages with you of a serious strike in the district, supposing the men in the neighbouring collieries were to strike for higher wages the effect apparently would be that you would get the trade of those collieries because you have reason to imagine that your men would not join in that strike?—I think they would not.

12,594. Supposing that the collieries in the district were acting upon that principle would it not then be just the same as it now is, a question of a standard of wages?—It is exceedingly difficult to say what would be the effect, ours being such a novel plan. I think that if the men understood it properly they would say "there is no reason for us to demand a great "advance of wages—if the colliery is unusually "prosperous we shall get it in our bonus; if we do "not get it weekly we shall get it at the year's "end."

12,595. (*Mr. Hughes.*) In regard to Lord Lichfield's question, is it not the fact that since the conversion of the colliery there have been occasions on which you have gone on working while pits in the neighbourhood have played for the masters and men to consult whether they would strike?—Yes; there have been a few instances.

12,596. (*Mr. Harrison.*) Some of the shares are held by the people employed, are they not?—Yes, some of the number, not very many. I think about 150.

12,597. Do they still show a disposition to continue

the payment of the bonus to the working people who are non-shareholders?—Those who are shareholders wish to receive a larger proportion of the bonus than non-shareholders. There are two of the men here who are shareholders, and I tell them that they will have to stand on their defence in that matter.

12,598. You see that tendency among the working men who are shareholders?—Yes. Then the men take the side of the capitalists, and become capitalists in their notions.

12,599. You know that in the Rochdale cotton mill the shareholders there have struck off bonus from all those who are non-shareholders?—Yes, and I think that would be the tendency among our own men if we did not check it.

12,600. (*Mr. Roebuck.*) Do not you think that those small shareholders who have been originally workmen would be harder upon their fellow workmen than you would?—I think they would.

12,601. (*Mr. Booth.*) Can you say whether your collieries are worked more economically on the new system than they were before?—I believe they are, but it is difficult to get statistical evidence to prove that further than that we may say that we have had very few play days—there have been scarcely any stoppages for the frivolous reasons for which there were before—we have only had about half-a-dozen play days during these last two years.

12,602. They have worked more smoothly and pleasantly, but whether more profitably you have hardly yet had the opportunity of ascertaining?—Infinitely more smoothly, and no one can appreciate the difference of feeling between us as well as I can; but it is difficult to explain it to a third party.

12,603. (*Mr. Mathews.*) Is it your experience that the men work more smoothly as a rule when the masters are gaining than when they are losing?—Yes, every strike has taken place in our district to resist a reduction of wages. Except the first strike I referred to every advance has been conceded without a strike.

12,604. (*Mr. Booth.*) There has been no reduction under this new system, has there?—No, not until the last few days.

12,605. Has that been submitted to?—Yes, our men perfectly understand it, and are perfectly willing to accept it as soon as it is carried out at the adjoining collieries.

12,606. (*Mr. Mathews.*) To what extent is that reduction?—From $7\frac{1}{2}$ to 10 per cent.

12,607. Is there not a reduction going on in Lancashire and Wales to the extent of 15 per cent.?—Yes.

12,608. Do you know the result?—They have struck in Lancashire.

12,609. Are you aware that the men have consented to 10 per cent. leaving the 5 per cent. to arbitration?—I did not know that.

12,610. (*Mr. Harrison.*) Of course there has been a change, but practically speaking you would hardly say that your position as the virtual proprietors and directors of the whole of that establishment had been altered by the establishment of the company, would you?—Yes; we have very much more control over our men now than we had under the old system; they are much more amenable to reason.

12,611. You are practically, I mean, proprietors, managers, and directors, with absolute control over the property?—We are now; we were not before we adopted the present plan.

12,612. You are even now more thoroughly proprietors of the colleries than you were before?—Infinitely more.

12,613. (*Mr. Hughes.*) But when you say that you are now more thoroughly proprietors of the collieries than you were before, do you not forget that before the conversion there were no rights in any other persons which would enable them to commence proceedings against you to enforce any claim whatever?—No; but a system of petty annoyance and opposition.

12,614. But as soon as you have shareholders in a company there are certain rights which arise against you, and which you would have to meet in any court?—Yes, but I am speaking of the general control.

12,615. (*Earl of Lichfield.*) Are any of your men now connected with the union?—I believe that in 1865 when we adopted that plan there were about 550 coal hewers, and I believe they were nearly all in the union. Now we have about 785, and from what I can gather only about 40 pay to the union, and that is only at one colliery, Methley Junction, and the Methley men live in the midst of unionism. Methley is a hotbed of unionism, and I believe it is more to keep on good terms with their neighbours than for any other reason that they subscribe and keep on the books.

12,616. (*Mr. Roebuck.*) Supposing that under your present system there are unionists, what advantage do they expect to derive from the union?—They get very little advantage at present, as I can gather. I believe they have no funds at all in hand in our district.

12,617. Have you a benefit club in your colliery?—We have an accident fund.

12,618. Have you a sick fund?—No, not for mere sickness. The men have a sick fund of their own, but separate from the union.

12,619. Those sick funds are not under the control of the union?—No.

12,620. Then as benefit clubs and sick clubs are within their grasp without joining the union, I want to know why now there should be any inducement to them to join the union?—The only inducement is that they think it might be a safeguard to enable them to resist any reduction.

12,621. (*Mr. Merivale.*) They might leave the colliery and go to another?—The present union extends over the district.

12,622. (*Mr. Roebuck.*) The union does not give them any power over you?—No.

12,623. They could not appeal to the union from any decision that you made?—No. I do not think that our men would think of appealing to the union now.

12,624. I suppose your hold on the men now is that from their good conduct and wise and economical proceedings, there is a chance of your increasing the bonus?—Yes. I may say that I issued an address, in which I pointed out the various savings that they might effect.

12,625. (*Mr Booth.*) Have you in fact been interfered with at all by the unions since you adopted this new system?—Not at all.

12,626. (*Mr. Roebuck.*) Have you any delegates there?—No; the men at Methley Junction made several attempts, very soon after we established this system, but before any bonus had been paid, they gave us notice that they should demand an advance of wages. That was referred to the men at the other collieries and they decided that no advance should be given, and they decided that it should be put down at all cost, and that we should allow a strike to take place at Methley Junction rather than give any advance. There was a meeting of shareholders just at that time, and the working shareholders who were present there were in favour of this demand of the Methley Junction men being resisted because they thought it unreasonable.

12,627. During this time had you any knowledge of interference with any of your proceedings by union delegates?—I think not. Union delegates have spoken much against our proceedings, among the rest William Brown.

12,628. Where?—At Methley. When we first adopted this plan I called a meeting of the Methley Junction men to explain it to them. William Brown was there and appeared very much in favor of the plan, and stood on the same platform as myself, and spoke to the men and said he should recommend them all to take shares, that it was just the thing they had been wanting. Within a few days, however, William Brown turned completely round. He found that the union delegates were against the scheme, and then he

Mr. H. C. Briggs.

24 March 1868.

persuaded the men all he could not to subscribe. He said, if they lent their money they would never see it again.

12,629. (*Mr. Harrison.*) Do not you think that to speak quite accurately the system which you have introduced might be described better as a bonus system than as a co-operative system?—Perhaps it might.

12,630. Practically speaking, the men who are engaged in the pit in any capacity have not anything like a control over the manner in which the work is carried on, have they?—No, they have no actual control.

12,631. Do you think that it would be possible to carry on extensive collieries upon such a principle which might be called strictly the co-operative principle, as that the men who were at work in it should in meetings assembled manage the concern for themselves, and elect their own directors and managers?—I am quite sure that it would not last a month—not with their present education—they require to be educated up to that, and I think our system may educate them up to that in time.

12,632. Supposing that such a thing was on foot, supposing for instance that the shares of your company were held pretty equally amongst all the men actually engaged in it, or amongst a large proportion of the men engaged in it, do not you think that the tendency would be that they would ultimately refuse to share any of the bonus with the workmen who were not shareholders?—I think as far as I can judge from my own experience that that would be rather so, they would rather grudge the bonus to the men not shareholders.

12,633. Then your plan, I understand you to say does not at all differ from the views of those who think that the management of a concern of that kind should be in the hands of one proprietor and not of a body of shareholders?—No; I think if it were in the hands of a body, they are so supicious of one another, that they would soon quarrel. In fact, they have tried to start a colliery on the truly co-operative system as you describe it and they cannot. Besides that, they cannot raise the money.

12,634. (*Mr. Hughes.*) Why do you call it truly co-operative?—I only used that phrase because Mr. Harrison spoke of ours as a bonus system in contrast with it.

12,635. (*Mr. Mathews.*) The difference between the co-operative system and yours is this, in the co-operative system the whole of the members of the co-operative company are equally participators in the capital and in the profits?—Yes.

12,636. In your case you assign to yourselves 10 per cent. in the first instance on capital, and divide with the co-operators any profits over and above that?—Yes.

12,637. You spoke of the propriety of extending the bonus equally to those who are not proprietors and to those who are proprietors. Do the men who are proprietors with yourselves object to the bonus to the others?—They do not like the men who are not proprietors to receive the same proportion of bonus. During the first year, we gave a larger proportion of bonus to the shareholders in order to encourage men to take shares, and up to the present time there has been some difference. This last year the men who were shareholders received half as much again as those who were not shareholders. The working men who are shareholders are very much for continuing that disproportion, we think that they ought to be equal, and we see no reason why they should not, we think that we should sell more shares among the men.

12,638. (*Mr. Harrison.*) The very essence of the successful working of your system, which is that of the increased individual attention throughout the whole mine, requires, does it not, that the bonus, whatever it is, the advantage of the system, should be shared by the workers irrespective of their being holders of the capital?—Just so.

12,639. Then in fact you think, that if the shares were held by a certain proportion of the workers and they carried out the tendency which they have shown at the Rochdale Cotton Mills, they would be cutting the throat of the system?—Yes, making it a mere joint-stock company.

12,640. (*Mr. Roebuck.*) That means to say that the uneducated holders of small shares are not the best judges of their own interests?—I think not. I do not know that they go so far as to wish to take the whole of the bonus for themselves, but they wish to take the lion's share.

12,641. And thereby take away the incentive from these people to be careful and good workmen and save everything they can for the purpose of increasing the bonus?—Yes.

12,642. (*Earl of Lichfield.*) But as you have the entire control of the thing it is not in their power to say whether they shall have that bonus or not?—Just so; we are not bound according to our articles of association to give any bonus whatever. It was mainly that it was such a novel plan that we did not wish to bind ourselves beyond the twelvemonth. We have continued it for two years and have no wish to give it up.

12,643. (*Mr. Hughes.*) No alteration could be made except by a meeting of shareholders?—No.

12,644. You only have control as any holder of a majority of shares would have it in any other company?—Yes.

12,645. (*Mr. Harrison.*) You know, generally speaking, the way in which the Pioneers store at Rochdale is managed?—Yes.

12,646. In the case of the pioneers at Rochdale the shares in that concern are held by a very large number of small holders, I suppose nearly all working men, and the affairs of that are managed by meetings of the shareholders, who, *bonâ fide*, without any superior influence whatever, elect managers and determine dividends, and carry on the concern?—Yes.

12,647. You do not think that your collieries would go on well if that particular system were ever carried out in your case, and that subdivision of the capital, and that mode of management by voting at meetings, and the election of the officers and managers and directors, were strictly applied?—It is very difficult to answer that question, but from our experience hitherto we should not at all like to give up our control. We do not think that the men are educated up to it.

12,648. (*Mr. Hughes.*) But when your men have had 20 years experience as the Rochdale men have had, perhaps you think it possible they may turn out able to manage the colliery?—I think so; there are many clever men amongst them. One of the principal reasons I had in adopting the plan was, that I thought that the colliers had a very vague idea as to what our profits were, and that we should not lose anything by publicity.

12,649. (*Mr. Mathews.*) I suppose that in your accounts you put by a certain sum for recouping?—Yes; we take 12 or 15 per cent. off certain items which are worthless at the end of the lease, a small per-centage over moveable plant, and a still smaller per-centage off rails, and we have verified that for the last 30 years.

12,650. As betwixt the class of men who are not shareholders in your concern and ordinary colliers, the difference is, that the former receive a larger bonus?—Both shareholders and non-shareholders receive it; only the working shareholders receive a larger proportion of bonus than the non-shareholders. During the first year there were 30 per cent. of our men who qualified themselves to receive the bonus. We made a rule that every one who wished to receive a bonus should take out one of these little books (*producing a book*) in which the rules are printed on the back, and in which his wages should be entered at least once a fortnight. Those books they had to buy at the cost of 1*d.* each. We made that rule in order to ascertain who took any interest in the matter and who not. During that first year 30 per cent of the men took out

those books. 70 per cent. of the men had not sufficient faith in the plan to pay a penny for a book.

12,651. (*Mr. Hughes.*) Will you state what amount was divided between the men in bonus at the end of the first year?—1,800*l.* the first year and 2,700*l.* the second year, that was the proportion we allotted to bonus.

12,652. (*Earl of Lichfield.*) What addition did that make to the wages of any individual workman?—For the first year we paid to our working shareholders 10 per cent. on their earnings, and working non-shareholders received 5 per cent. During the second year we paid 12 per cent. to our working shareholders, and 8 per cent. to non-shareholders. During the second year 80 per cent. of the men qualified themselves to receive bonus; during the first year only 30 per cent. had done so.

12,653. (*Mr. Roebuck.*) Did I rightly understand you that you paid 12 per cent. to your shareholders?—12 per cent. on their wages.

12,654. You did not pay 12 per cent. on their shares?—Yes; during the second year we paid 13 per cent. on their shares, and besides that we paid them a bonus on their actual earnings.

12,655. Now comes my difficulty; I thought your plan was that after you had received 10 per cent. you divided the surplus amongst the workers?—No, we take one half of that ourselves. We appropriated to dividend to labour and to capital altogether during the second year 16 per cent. on our capital, of which we paid 13 per cent. to the shareholders, and 3 per cent. on our capital we divided among our workmen, and that enabled us to pay as a bonus on their actual earnings 12 per cent. to working shareholders, and 8 per cent. to working non-shareholders.

12,656. (*Earl of Lichfield.*) When you say 12 per cent. to the working shareholders, and 8 per cent. to the working non-shareholders, that 8 per cent. is 8 per cent. upon their wages; they had no shares?—They had no shares; 8 per cent. upon their wages.

12,657. (*Mr. Harrison.*) Shareholders who work receive first upon their shares and then upon their wages, do not they?—Yes.

12,658. (*Mr. Hughes.*) Besides having paid that 13 per cent. to shareholders and 3 per cent. to your workpeople, making 16 per cent. on the whole you put by in both years a sum to the reserve fund?—Yes, before calculating anything of profit we deduct enough to pay our wear and tear and depreciation. We do not divide to the extent of our profit. We had a remarkably prosperous year, (I do not lay it to the credit of co-operation altogether) and therefore we laid by a sum to be appropriated to bonus in another year if a bad year should come.

12,659. What amount did you put by in that year besides having paid 16 per cent.?—Last year we carried to the general reserve fund 8,000*l.* We made a profit of 20,417*l.*

12,660. After making all allowances for wear and tear?—After making all allowances for wear and tear.

12,661. So that in fact in the second year after your conversion you made upwards of 20 per cent. upon your whole capital?—Yes.

12,662. (*Mr. Mathews.*) But the state of the coal trade was exceptionally good, was it not?—It was, as I have said before, I do not lay it all to the credit of co-operation.

12,663. Is it enough to take a short period like that to ascertain what profits might be fairly expected?—No; I think it should be seven years.

12,664. If you were to take the average of seven years, instead of one or two exceptionally good years, do you think that you would arrive at the same result?—We should not have averaged the same results that we have, no doubt. Of course the system has yet to be tried. I do not say that we have weathered all the storms, but I think that we have a fair chance of weathering them.

12,665. (*Mr. Harrison.*) The union in your West Yorkshire district is not nearly so strong or extensive as it is in the South Yorkshire district, is it?—No.

12,666. The union in the South Yorkshire district is very general?—It is very general, and it is not so general in West Yorkshire, and the delegates lay that to our co-operative system. They say that there are two black palls hanging over the district, and one of those is our co-operative system.

12,667. Do you know anything about the working of the South Yorkshire union with the employers of that district?—No, not much.

12,668. By hearsay, do you?—Yes; and I hear that the masters are not masters there, but that the union are masters there.

12,669. (*Mr. Roebuck.*) And they being masters, does the whole affair turn out well?—I have not been in the district myself very much lately, and therefore I could not say.

12,670. (*Mr. Mathews.*) Is it not the usual result of one or two exceptionally good years in the coal trade to influence the introduction of capital more largely into collieries?—Yes.

12,671. Parties who have plenty of capital to dispose of and not much knowledge of the business then invest it?—Yes.

12,672. The result of that usually is bringing an undue number of collieries into operation, and after two or three good years there are two or three bad ones?—Yes; one man fails, and another coal master buys his colliery at perhaps one-half of its cost, and can afford to work cheaper than others.

12,673. If you take the average between the prosperous years and the disastrous ones, can you state that the result of your experience would justify the expectation of 10 per cent on the capital?—I hardly think it would.

12,674. (*Mr. Hughes.*) Do you think from what you see now that you are likely to go down below the 10 per cent?—I think not. In our system we have not only interested our men, but we have likewise interested our customers. We induce a great many of our customers to take shares, and certainly during this last bad slackness of trade they have striven very hard to keep up the trade; they sent all the waggons they possibly could to our collieries. And that has done a great deal to keep our trade up. I believe that we have never worked less than four days a week during the last bad time of trade, while others have worked only two days a week. Our sale has been 7,200 tons a week for the last few weeks, and we have never reached above 8,500 tons.

12,675. The general trade has been bad?—Yes.

12,676. (*Mr. Roebuck.*) Can you account for its being bad?—I think there seems to be a want of confidence which arises from the speculation that takes place in the trade in raw materials at Liverpool and elsewhere. If I may be allowed to refer to another matter, I saw that some evidence had been given by some other witnesses with regard to the system of forfeiting corves for bad work, that is to say, coal coming up in corves badly filled. In our district that has never been done as it was in the north of England; the men have always been paid for what there was in a corve, whether more or less. There has been a system of forfeiting the coal if they were not properly riddled, or if they were improperly filled, mixed with dirt, there has been a system of forfeiting the coal under those circumstances, but not to the whole extent, but only to one half; and there was a man appointed jointly by ourselves and our workmen (it was Pickles who was appointed) to inspect the coal on the pit bank and whatever he decided was done, and we found that that prevented many of the stoppages that took place previously owing to disputes on those little matters.

12,677. (*Mr. Booth.*) In carrying on your concern on this new system have you experienced any difficulty in reference to the present state of the law as to partnership?—Not so far.

12,678. You have no amendments in the law that you desire to suggest with a view to that kind of partnership?—No; I cannot say that we have ex-

Mr. H. C. Briggs.

24 March 1868.

perienced any difficulty, so far. Before I finish I may say that we have nearly all the leading men of the union, and who were formerly the most leading men of the district in our employ. Several of them have taken shares and are now working very quietly. They have not been put in any special situations, but they are working mostly as coal-hewers. Some of them have bought land and built houses on our own property.

12,679. (*Mr. Hughes.*) As far as your experience goes the leaders of the union are not mere idlers?—No. I think that the leading men are very often the intelligent men, but there are a great many of the rabble that they cannot lead and who make the disturbance. I do not mean by leading men men who go about lecturing in the country, but I mean men who are the principal and most intelligent men at these collieries.

12,680. But, as far as your experience has gone, in all the quarrels that you had with your men previously, the leaders were men in your own employ?—The leaders were in our own employ, with the exception of Brown.

12,681. The leaders, as they then were, are now in your employ?—Yes, and moreover we have many who were leaders in other collieries.

12,682. Those men are dilligent workers and have become shareholders?—Yes, in many respects they have become our mainstay and support, they took shares when no one else would. We have Richard Pell, a secretary of the union, who has joined us within the last few months. We have John Toft, he was a leader in those days.

12,683. John Toft was sent to prison over the riot; was he not?—No; he was acquitted at York. John North is another; James Shepherd is another; and there were some men who worked at Methley Junction. Haigh is the man who was sent to prison for nine months. We have him, or had him, the last few months; and Robinson, another man who was sent to prison for those riots. One of the former witnesses (Mr. Eley, I think it was,) made the remark that Brown said in one of his speeches that the men ought to have part of their masters' capital. In our system we do give them part of the masters' capital, or enable them to participate in some of the profits that would be put to capital.

12,684. (*Earl of Lichfield.*) If any of your workmen apply for shares now, have they to pay the market price?—No; in our last issue we issued 1,000 shares, and issued them at 2*l.* 10*s.* premium, to the workmen, which was the medium between par and market price.

12,685. Your experience leads you to believe that the system which you have adopted of giving a bonus out of your profits to your workmen has contributed to habits of providence?—I am quite certain of it. I do not think that that system is so applicable to other works as it is to coal mining, because in collieries 70 per cent. is spent in wages, and another 15 per cent. in things on which the men can save; so that there is 85 per cent. which co-operation affects.

12,686. (*Mr. Mathews.*) The other 15 per cent. would consist of royalties, I suppose?—Yes, and other charges which co-operation will not influence. I have a large number of men working in Dundee in the spinning trade, and I do not think it would be as applicable to that business as it is to the coal business.

12,687. (*Mr. Roebuck.*) What do you say as to ship building?—I have not had any experience in ship building.

12,688. (*Mr. Mathews.*) In iron making it has not been very successful, judging from the experience of Messrs. Fox, Head, and Company?—I do not think that they have had any chance yet in the iron trade.

The witness withdrew.

Mr. A. Briggs.

Mr. Archibald Briggs examined.

12,689. (*Mr. Hughes.*) You have been secretary to Messrs. Briggs and Company since the conversion, I believe?—Yes; I commenced when it was converted into a limited company.

12,690. Can you state the number of shareholders that there were amongst the men in each of the years?—Not for each year. I have the number at present showing the number of each class of workmen who have become shareholders, and how many shares they hold. That statement is as follows:—"The statement of workmen employed and proportion of miners and of top hands" (by top hands we mean men who work on the surface, not under ground), "who have taken up shares." I look upon this as rather important, inasmuch as the miners, though there are not many of them now connected with the union, have all their lives been under union influence, whereas the surface hands have never been connected with the union in any way; therefore it is rather interesting to see whether the miners or surface hands appreciate or avail themselves of the benefit most. The result is, that we have at the present time 785 miners employed, of whom 83 are shareholders. Besides that, we have boys employed underground to the number of 214; none of whom are shareholders. The top or surface hands number 204, of whom 61 are shareholders. The result of that is that one miner out of every 9½ is a shareholder, and that one top hand out of every 3⅓ is a shareholder; therefore in proportion there are three times as many shareholders among the surface hands as there are among the miners. The 83 mining shareholders hold 94 shares, 6 being the largest number held by one individual. The 61 top-hand shareholders hold 84 shares, again 6 being the largest number held by one individual. This is irrespective of 9 managers, clerks, &c., who hold 86 shares, 22 being the largest number held by one individual. The complete list of working shareholders gives us—miners 83 holding 94 shares, top hands 61 holding 84 shares, and 9 managers, clerks, &c., holding 86 shares, the total being 153 holding 264 shares.

12,691. May not the fact you have mentioned possibly be accounted for by the fact that miners do not earn so much as the top men?—I meet that question by taking out the average wages earned—taking the last week, and I find that during the last week, taking the difference in the three seams of coal we are working;—in the Stanley main seam, the average for the whole number was 1*l.* 6*s.* 8½*d.* in five days. It is possible that all the men may not have worked the whole five days, but supposing they had that would average 5*s.* 4*d.* per day. In the Haigh Moor 1*l.* 4*s.* 8*d.* was earned in 4½ days, or 5*s.* 5¾*d.* per day. The Methley Junction men worked 5 days, and earned 1*l.* 5*s.* 3*d.*, or 5*s.* 0½*d.* per day, and the by-workmen, that is, bottom men working in the pit, but paid by the day and not by the ton, receive 5*s.* a day. The average of the whole surface men during that week was 3*s.* 4½*d.* per day, so that we find from that that the average of the bottom hands, the miners, comes out to something like 5*s.* 3*d.*, and the average of the top hands to 3*s.* 4½*d.*, and I think that that week may be taken as an average week as regards the proportionate earnings of surface hands and miners. I may state that (I only tried this in one pit) the two best men in one pit working together earned 2*l.* 1*s.* each in five days, or 8*s.* 2½*d.* in one day. They were rather exceptional workmen.

12,692. (*Mr. Mathews.*) What is the total number of shares of which the company consists?—The original number was 9,000 shares. Since then we have created 1,000 more, of which 770 are allotted, 230 being reserved for our workmen.

12,693. How many of those belonged to the original proprietors?

(*Mr. Henry C. Briggs.*) 6,450 out of 9,770 we have retained for our proportion of the shares, above two-thirds.

12,694. (*Mr. Mathews, to the witness.*) What proportion is there in the hands of the workmen?—264 at present; you may say 264 out of 9,770.

12,695. What proportion do the public hold?—The public and our customers hold the balance.

12,696. Are the other shares issued?

(*Mr. Henry C. Briggs.*) There are 6,450 held by the original proprietors, 264 held by clerks and men, 114 by non-resident agents, 1,068 by customers, and 1,874 by the public, that makes the whole number allotted, 9,770.

12,697. (*Mr. Mathews, to the witness.*) In the case of anyone wishing to become a proprietor, he can only buy shares from those already interested?—The public would buy them in the ordinary way.

12,698. What are they at now?—About 14*l.* 5*s.* to 14*l.* 10*s.* 10*l.* has been paid up.

12,699. (*Mr. Hughes.*) You have been in constant communication with the men from the beginning of this system, have you not?—Yes.

12,700. Have you seen a beneficial effect upon them in consequence of the conversion?—If you mean in a moral and intellectual way, alluding more particularly to improvements in their character, in that way I should say, decidedly, that there is a great improvement. And I had a communication of that the other day from the Rev. Mr. Lane, the rector of Normanton, lately come to Normanton. Without my asking him the question at all he remarked what a great difference there was between the character of our men and that of neighbouring men working for other firms who lived close beside them, and almost in the same row of houses. He said that he found a great difference in their character, that they were a steadier, better lot, and as he was a new comer he did not quite understand where this difference arose.

12,701. I remember when I was down at your first yearly meeting it was stated that one or two of the men had spent the bonus in drink, and there was great indignation expressed. Would that indignation have been probably expressed in previous years?—Of course they never had the bonus to spend before, but I do not think that such a fact would have excited the same general feeling. And I may say in regard to that that this last year to guard against that wrong spending of money, I put in the notice by which the bonus was paid, a memorandum to say that we expressly trusted that the money would be well spent. And I may say that out of nearly 1,000 men who received bonus I could not hear of more than three who spent it badly; that is to say, who stayed away from their work and were known to be drinking. Those three I drummed out, as it were. I went the next pay day, the men were not there, but I wrote out a fortnight's notice in the regular form, and read it to the assembled men, and it was received with applause. And the three men were dismissed. They all tried to beg on, but we would not take them on again.

12,702. That you think was done with the thorough consent and approval of the other men?—Certainly. They all expressed strong approval when I read the notice.

12,703. With respect to your relations with the union, since the conversion, in the first year had you any trouble with the union?—We had no real trouble with the union. I may say that I always feel that in speaking of the union, one must guard against confounding the union generally, particularly such men as our workmen, who were the leaders of the union, and such men as were the paid delegates. My feeling is very much more against the delegates than against the unions as to the union delegates taking against our scheme, my own impression is that they took against our scheme because they thought it would take away from their influence, and that they would not be required to go about lecturing. I will just put in a pamphlet circulated by one of the union delegates, Mr. Ackroyd, on the subject of what they call pure co-operation, with a piece of poetry at the end about aristocrats and tyranny, and so on. It shows their attitude towards us.

12,704. (*Lord Elcho.*) Who is Mr. Ackroyd?—One of the delegates who go about lecturing and speaking to the men.

12,705. (*Mr. Hughes.*) That is not the attitude of the men whom you know as union men in your employment?—No; they are in our favour. I may say that in regard to that pamphlet, Mr. Ackroyd begins by describing, or very early in it describes, an imaginary colliery with a certain capital that exactly corresponds to ours. When he comes to speak of how the profits are to be divided, he only speaks as if we were a joint stock company and ignores the bonus entirely. Therefore I feel that it was not a true or proper representation. Those pamphlets were prepared to be circulated at a meeting of the miners when they expected that a great many of our men would be present. But the fact was that our men all worked that day and did not go to that meeting at all.

12,706. Did men go from all the other pits in the neighbourhood?—They did; and in connexion with that I cannot do better than put in a list (*handing in the same*) that I have prepared of the days on which our men stopped the pit since the 1st of January 1866. My brother has stated how frequent those days were before; that list shows every day on which the pits have been off work since that date.

12,707. (*Mr. Roebuck.*) Can you give the committee an idea of the pretext for play days before this system?—My brother has had more experience on that point.

(*Mr. H. C. Briggs.*) They were very frivolous; they are difficult to remember at this distance of time. Supposing we had to complain of a man for not filling his corf the day before, he would go on the bank and say, "Now, lads, I have had a corf stopped yesterday;" and it would be put to the meeting whether they should have a play day or not, and it was generally carried that they should.

12,708. (*Mr. Booth.*) Were those in general union men?—I do not know whether they were especially union men, but that was very general throughout the colliery.

12,709. (*Mr. Roebuck.*) That system since the establishment of the Limited Liability Company has ceased?—Entirely ceased.

12,710. If a man were now to go on the bank and say, "Now, lads, let us have a play day," he would not be answered with "yeas?"—No, certainly not.

12,711. (*Mr. Merivale, to the witness.*) Have you any evidence of the amount of the saving of stores which has been effected under the new system?—It is a difficult thing to arrive at because we have been increasing our workings and opening out the passages, and so on, the result of which is that we get a much smaller proportion of coal for the amount of stores consumed than we should in the regular working. Of course as you are increasing your work you have to have larger stocks and stores, and for that reason we cannot bring real statistics to show how that would be; all that we can do is that we can speak for the men working better and more carefully and being more economical as far as lies in their power.

12,712. You make it their obvious interest to save? Yes; but I think that some men that we have here who will give evidence after us can speak better to that.

12,713–14. (*Mr. Hughes.*) Statements were made confidently at the last general meeting that there was a large saving in timber. Do you think that the men would be able to judge on that point so as to know that it was not used so recklessly as before?—I think so.

(*Mr. Henry C. Briggs.*) I am sure that there has been a large saving in the item of rails. Previously I have known of men where they had to put in a piece of rail breaking a new rail in two, in order to get the proper length, and then bury it in the dirt if they broke it the wrong length, and break another. Now you never hear of anything of that kind happening.

12,715. (*Mr. Booth, to the witness.*) Your system has put an end entirely to the interference of the

Mr. A. Briggs.

24 March 1868.

union, I understand?—Quite. I should like to read a list of the days on which the men have played under the new system. It begins with March the 9th 1866. On that date the Methley Junction pit (you will find that if any pit plays it is generally the Methley Junction,) was off work on account of four men having been discharged. Having stayed away from work their tools were sent out and they were discharged. Those four men demanded that they should be put on again, and we did not put them on, and the pit played. On the 16th of March the men were off work at all the pits in order to hear the union delegates lecture. On the 14th of May the Methley Junction men and some of the Stanley Main and Haigh Moor men were off work to hear the union delegates lecture. Then there is nothing between May 1866 and November 1867. On the 27th of November 1867 all the men except those in the Good Hope pit were off work to hear Mr. Brown lecture. Mr. Brown, however, did not make his appearance. The object of the meeting was to collect funds for the Derbyshire strike. We have a good many men that have been imported from there, and I think it was their influence in great measure that induced the other men to play.

12,716. (*Mr. Roebuck.*) On that occasion Brown did not appear?—No. It was on that occasion when Mr. Dixon told the men about the black pall that was hanging over them, and John Toft got up to speak in favour of our system, and the men got tired of him, and clodded him with clods, and a policeman had to protect him. Then on the 2d of March 1868 there was a meeting of all the colliers from the neighbouring pits, to hear the union delegate's lecture; but none of our men were absent from their work, except such as were disabled by sickness. On the 16th of March, last Monday the Methley Junction men were off work in honour of a mass meeting of colliers at Hunslet, to discuss the proposed reduction of wages in the Gildersome district. I say in honour of that meeting, because very few of our men went to it, and they excused themselves afterwards by saying that they had been so blackguarded for working when the last meeting was held, that they could not stand it. They did not go to the meeting, but they made a play day.

12,717. (*Mr. Hughes.*) So that in two years and a half you have only had six days' play?—Only five, and I may say that those play days had a very great effect on the profits of the collieries. I suppose a play day on the whole of our pits cannot cost us less than 120*l.* to 150*l.* Not only is there the loss of trade, but there are ponies to keep pumping engines at work and a great many men that must be at work all the same to keep the passages in order, so that those very play days induced by the union would put it out of the master's power to give better wages.

12,718. (*Mr. Mathews.*) Supposing that you could only work four days a week what effect would that have?—A very serious effect; we are now working four days a week.

12,719. If a colliery were to come down to three days a week, generally speaking the colliery would make no profit whatever?—Yes; I think we should be just square then, neither making nor losing.

12,720. (*Mr. Hughes.*) Do you agree with your brother in thinking that this system is not so easily applicable to other trades and industries?—I think it stands to reason that in those trades where labour is a very large proportion to the whole cost, the system must be much more applicable than in other trades. If you take it in an extreme case, namely, in the merchant's business who simply pays his warehouse men for carrying his bales of cotton there it would be scarcely applicable at all.

12,721. But in all productive industry it would be applicable according to the intelligence of the men who applied it?—Yes.

12,722. (*Mr. Mathews.*) How is it that in the case of the iron trade where the proportion that labour bears is even higher than it is in coal, it has not succeeded?—I do not think that it has had a fair chance in Fox, Head, and Company's, owing to the state of the iron trade.

12,723. (*Mr. Hughes.*) And is it not the fact that Messrs. Fox, Head, and Company have never got over the suspicious of the men?—One thing they have that we have not, they do not admit any union men, we do not say that, we say, "If you like to pay a shilling a week to the union do it."

12,724. Was it not that jealousy which probably wrecked Fox, Head, and Company's attempt to establish the co-operative system in their works?—It may have been so.

12,725. (*Mr. Roebuck.*) Though you allow your men to join the union you do not allow the union to interfere with your government at all?—No. I may state that I have made out an analysis of the cost in wages and so on for the year ending June 1867 (*handing in the same*), and as an illustration of the different feeling now from what there was before I may show that little address (*handing it in,*) which was presented to my brother at the time of our first annual meeting when Mr. Hughes was present. The men of their own accord, without our knowing anything about it, got up that address and presented him with it, he had been absent then a year from the colliery.

12,726. (*Mr. Hughes.*) Who proposed that address?—Mr. Pyrah was the proposer, and Mr. Toft the seconder.

12,727. Was not Mr. Pyrah the Commander-in Chief of the union at one time?—Yes, and Mr. Pickles the secretary.

12,728. A good many of your shareholders have bought plots of land since, have they not?—Yes.

12,729. Do you suppose that much of the bonus has been invested in that way, have you any means of knowing that?—The number who have bought plots of land are small in proportion to the whole number of men, but I think that a good deal of the bonus has come back in the shape of subscription for shares, a good many have taken up shares or fresh shares.

12,730. Was not there some man who subscribed the whole of his bonus to a charity?—Yes, and we had to turn him off, I am sorry to say.

12,731. What was the case?—Four charities he subscribed to. We had to turn that man off afterwards for trying to stop the others from going to work. There was a question asked, I think, as to the amount paid in bonus to the men. I find that for the first year the average bonus of the whole men, top and bottom, was 3*l.* 9*s.* 2*d.*, and for the second year 3*l.* 3*s.* 2*d.* The largest bonus in the first year was to a miner named David Newton who had earned 109*l.* 8*s.* 9½*d.*, 10 per cent. on that came to 10*l.* 18*s.* 10½*d.* The next year the greatest earning was by another miner of the name of Joseph Hough, he had earned 108*l.* 15*s.* 5½*d.* and he received 9*l.* 17*s.* 10*d.* as bonus. Those were the largest sums.

12,732. (*Mr. Roebuck.*) Can you tell me whether the education of your men and their children has at all improved since the present system; have they paid more attention to the education of themselves and their families?—The numbers of children sent to the schools have very largely increased.

12,733. What sort of schools have you, and what do you do in the way of contribution to the schools?—We have a day school to which the children come and pay so much a week (I think 2*d.* a week). We have a master and an assistant master and two mistresses, and we make up whatever the deficiency is. We have a Government grant, but we guarantee them a certain salary, and we make up the deficiency.

12,734. What do they teach, reading, writing and arithmetic?—Yes, they go through the regular course enjoined by the Council of Education. Both masters are certified by the Government.

12,735. Can you perceive any sort of change in consequence of that improved education amongst the families?—There has hardly as yet been time enough distinctly to feel it, we see great general improvement in the character of the men.

12,736. As one instance, is there any change in the

appearance of their houses and in their manner of life, is the house more cleanly and better kept?—I think I may say that there is an improvement in that way.

12,737. An improvement in comfort?—Yes, an improvement in comfort.

12,738. I suppose that in so short a time you can hardly judge whether there is any change in the manners of the men, but do you think they are more gentle?—They are more gentle to us; I do not know whether among themselves they are. One can see a great change, there is certainly a great difference in their manners to us and their way of speaking to us.

12,739. (*Lord Elcho.*) You have said that a clergyman who recently came there has found a marked contrast between your men and others in the adjoining collieries and even living in the same row?—Yes.

12,740. In what way did he see the contrast?—He was speaking of the sobriety and general steady conduct, he did not name any particular points.

12,741. (*Mr. Roebuck.*) I should like to know whether there is any marked feeling about religious sects amongst your men, there are various sects amongst them, I suppose?—Yes.

12,742. And various ministers?—Yes.

12,743. Are a large proportion Church of England ministers?—A small proportion are Church of England, the Methodists are more dominant, there are a few Irish Catholics.

12,744. Who is your Methodist minister there?—Now we have three chapels connected with the collieries, one at Whitwood, and one at Methley Junction, and one at the New Pit.

12,745. Have those ministers much communication with your men?—Mr. Pyrah can tell you most of that, he is a Methodist.

12,746. (*Mr. Hughes.*) The Church of England clergyman would probably be in some communication with the people?—He visited pretty nearly all when he first came.

12,747. (*Mr. Mathews.*) Have the Methodists separate schools?—They have separate Sunday schools.

12,748. Do you subscribe to them?—No, each body has its own Sunday schools.

(*Mr. H. C. Briggs.*) We have subscribed a little to help them. We have built a Methodist chapel at Methley Junction.

12,749. (*Mr. Roebuck.*) How many would that hold?—About 150.

12,750. Is a minister appointed to that chapel?—There is a circuit appointed.

12,751. Do the men contribute anything to the maintenance of their ministers?—Yes, I suppose so. I do not know their regulations at all.

(*Mr. Pyrah.*) Certainly they do.

12,752. (*Mr. Hughes to the witness.*) You confirm the statement of your brother as to the former union men not being in any particular office in the colliery, they are just working with the other men?—Just working with the other men.

(*Mr. H. C. Briggs.*) Mr. Pyrah is working precisely the same now as he was in 1863, before the strike. Mr. Pickles was a coal-hewer at that time and then he was appointed inspector by the men and ourselves jointly, and we jointly paid his wages, the men paid half and we paid the balance.

12,753. (*Mr. Hughes.*) Do you keep a check weigher still?

(*Witness.*) They have a check weigher at the Junction.

(*Mr. H. C. Briggs.*) At the other pits they appointed one, but they found it no good, that is to say, they found that they got as good weight without a check weigher as they got with one.

The witness handed in the following statements:—

"Henry Briggs, Son, & Co. Limited.

Analysis of the costs in wages, royalties, stores, and other expences, but not including agencies, interest, or depreciation on plant; showing the per-centage of the entire cost, entailed for each item.

Extracted for the year ending 30th June 1867.

—	—	—	Per-centage of entire Cost.
	£ s. d.	£ s. d.	
Wages in cash - -	57,055 17 3		
——— coal allowed to the men at 1*s.* 6*d.* per ton	1,115 4 9		
	———	58,171 2 0	70·7
Timber - - -		3,662 14 8	4·5

Totals - -	123	842	8,431 5 8	34,390 4 2

From the above it appears that out of 9,578*l.* of wages on which bonus was claimed by top hands, 3,822*l.* was paid to shareholders; and out of 33,243*l.* of wages on which bonus was claimed by miners, 4,609*l.* only was paid to shareholders."

The witness withdrew.

Adjourned to to-morrow at 1 o'clock.

1, Park Prospect, Westminster, Wednesday, 25th March 1867.

PRESENT:

The Right Honorable the EARL of LICHFIELD.
Lord ELCHO, M.P.
Sir DANIEL GOOCH, Bart., M.P.
HERMAN MERIVALE, Esq., C.B.
JAMES BOOTH, Esq., C.B.
JOHN ARTHUR ROEBUCK, Esq., M.P.
THOMAS HUGHES, Esq., M.P.

THE RIGHT HON. THE EARL OF LICHFIELD IN THE CHAIR.

Mr. H. C. Briggs.

25 March 1868.

Mr. HENRY CURRER BRIGGS further examined.

12,754. (*Chairman.*) We understand that you wish to give some further evidence?—There are just a few points that I want to make a little more clear, in which perhaps we were rather hurried yesterday afternoon. One is with respect to the management. We said that we retained the entire control of the management, but I wish to say that if we can educate any of our intelligent miners into being capable of taking a more direct interest in the management we should have no objection whatever personally to have a working man on our Board to work with us. I think that a workman might suggest a good many improvements, and perhaps be able to deal with his fellow-workmen better than we can. We should have no objection to that as soon as any of the men are capable of filling such a post.

12,755. (*Mr. Booth.*) What is the number of directors?—Seven.

12,756. How are they appointed?—By the shareholders.

12,757. Annually?—Yes.

12,758. (*Mr. Roebuck.*) What is the qualification?—50 shares is the qualification for a director, except for our own men; and by the articles of association we allow our own men to become directors at a lower qualification; no qualification is fixed except for 4 stranger.

12,759. (*Mr. Hughes.*) But one or two gentlemen whom I know who are directors of your company must have been working men, I think?—The cashier is one; he has been brought up at the colliery; his father was a servant of my father's for many years.

12,760. And one of the engineers, Mr. Robson?—He has risen from being a mechanic. He has been brought into the shops and gradually risen. I do not mean that he has risen in our works; it was in the north of England.

12,761. (*Sir D. Gooch.*) You have the control by the voting power now?—Yes.

12,762. (*Chairman.*) That you propose to retain?—Yes; We do not consider that the men yet are capable of exercising the control. We should not like to put our property, at any rate, under their control entirely.

12,763. (*Mr. Hughes.*) But you probably look forward to a time when it may be possible, as you may wish to sell a considerable portion of your shares?—Yes; of course our voting power would cease then.

12,764. In fact you are simply on the footing of other large shareholders in other limited companies?—Yes, except that, according to the articles of association, there is in our case a vote for every share.

12,765. But that is not unusual in other companies I have seen?—No it is not.

12,766. (*Chairman.*) But if the undertaking proves successful your men will have to give a larger price for the shares than they are now selling for?—Yes they will. Already some have taken shares at 12*l.* 10*s.* who refused to take them at any price in the beginning, because they had no faith in the scheme.

12,767. (*Mr. Roebuck.*) How much is paid on the shares?—10*l.* is paid up; they are 15*l.* shares, but 10*l.* is paid up.

12,768. (*Mr. Hughes.*) There is a margin of 5*l.* to call?—Yes. In the open market they are now sold at about 14*l.* 5*s.* to 14*l.* 10*s.*, 4*l.* 5*s.* to 4*l.* 10*s.* premium. But the men have bought them at as high a premium as 2*l.* 10*s.* Then there was a question asked by Mr. Harrison yesterday, as to what he called the pure system of co-operation, one conducted entirely by the men without assistance from capitalists. I would only add, that in a colliery it is almost impossible for the men to raise capital sufficient without the aid of capitalists. In that pamphlet which was put in yesterday, Mr. Ackroyd makes some remarks upon the inability of colliers to raise even 10*l.* a man. Now at least 100*l.* a man is required as capital in a colliery, so that a colliery that employs 1,000 men must have a capital of about 100,000*l.* You may take that as about the rule in our district.

12,769. (*Lord Elcho.*) Do you mean that that would apply generally?—I am not so much acquainted with other districts. I believe that in the north of England it would require more, because the pits are deeper. I think that in our district you may take it as a rule that it requires 100*l.* for every man employed as a coal hewer.

12,770. Can you speak as to Scotland?—As far as my knowledge of Scotland goes. I should think that it was hardly so much in Scotland.

12,771. You think less capital would suffice there?—I think slightly less would suffice, but not very much less.

12,772. (*Chairman.*) Have you anything further to state?—There were some questions asked yesterday, I think by Mr. Roebuck, with regard to the applicability of the system to other businesses, I would only add that I think it applicable to every business in proportion to the frequency and disastrous character of the strikes that occur in the business, because it is in those very businesses where the labour is the greatest proportion of the cost of production that the strikes are the most disastrous, because any advance in wages becomes a larger per-centage on the total cost of production. For instance, in our case, an advance of 10 per cent. on our wages (our wages amounting to 70 per cent. on the whole cost) is equal to 7 per cent. on the whole cost of production, or 7 per cent. on our capital, because in a colliery the capital cannot be turned over more than once a year, that is to say, a colliery that has a capital of 100,000*l.* of coal cannot sell more than 100,000*l.* of coal in a year. On the other hand, an advance of 10 per cent. on wages in a manufacturing business, where, perhaps, only 15 per cent. of the total cost is in labour, gives only 1½ per cent. on the amount which they turn over during the year.

12,773. (*Mr. Roebuck.*) Can you tell me any case in which the amount of labour is not more than 15 per cent. of the total cost?—I am engaged in manufacturing at Dundee, where my firm employ about 2,000 workpeople in jute spinning and manufacturing of carpets; there our wages amount to about 20 per cent. And I think that in the higher class of goods, where the raw material is more expensive, the amount of wages would come even to a smaller per-centage than that.

12,774. In those cases where the raw material is expensive, I take it that the number of hands employed is small?—Yes, comparatively. But I cannot help thinking that our system is applicable to all those trades where you hear most frequently of strikes, and where the strikes are most disastrous. In other businesses, such as manufacturing businesses, the profits depend very much upon the judicious purchase of raw material and the judicious way in which sales are

effected. There is not much risk in that respect in a colliery, from the more regular trade that there is in a colliery than there is in a manufacturing trade; it is not liable to such violent fluctuations, either to such times of great prosperity or times of deep depression.

12,775. (*Chairman.*) Would it not be more difficult to apply that system to a trade where the work is done by the day. In your case it is done by the piece?—I do not know. The men would be more likely to look after one another at any rate, and it would save a number of overlookers; one man would take care that his neighbour did his day's work properly.

12,776. But in some trades the description of work to be done by the different workmen varies very much. Would it not be difficult in that case to apportion the amount of bonus at the end of the year among the different workmen?—I think not; if every man was paid precisely a per-centage on the amount which he earned, his relative wages would show his relative worth in the concern. I think it is the fairest principle. We have studied in every way to make it as fair as we can, and I do not know that we can suggest any great improvement.

Mr. H. C. Briggs.

25 March 1868.

12,777. (*Mr. Roebuck.*) That is to say, the sum of his wages (no matter how obtained) is that upon which you give the dividend?—Yes, the value of his labour is considered his capital in fact.

12,778. (*Mr. Hughes.*) Many of your top men are paid by the day?—A good many of them are paid by the day; a good many even of our underground men are paid by the day.

12,779. (*Lord Elcho.*) Have you ever had cases of men working by the day who have been complained of for not working properly?

(*Mr. Archibald Briggs.*) We have heard of their being found fault with, not to us, but among themselves.

12,780. And that remonstrance has been found sufficient?—They know that the eye of their fellow-workmen is upon them, and that has an effect.

The witness withdrew.

Mr. Joseph Pyrah examined.

Mr. J. Pyrah.

12,781. (*Chairman.*) You are in the employ of Messrs. Briggs, I believe?—Yes.

12,782. How long have you worked for Messrs. Briggs?—I think I have worked with them about 37 years.

12,783. What position do you occupy?—I am working in the bottom of the pit; I may say that I have worked nearly all my life for Messrs. Briggs.

12,784. Are you working now as a pitman or as an overseer?—As a pitman.

12,785. A system of giving bonuses to the workmen has lately been introduced into Messrs. Briggs's colliery, we understand?—Yes.

12,786. Are you a shareholder?—Yes.

12,787. Can you tell us what is the difference between the bonus given to the shareholders and that given to the non-shareholders?—I think that the working shareholders have double as much as the working non-shareholders.

(*Mr. Archibald Briggs.*) It was double the first year; it is now brought down to 50 per cent. more.

12,788. (*Chairman, to the witness.*) Then, in the first year, in addition to the interest which they obtained upon their shares, they obtained twice the amount of bonus that the non-shareholders did?—Yes.

12,789. Have you heard any complaint made on that subject on the part of the non-shareholders?—Well, I have heard some; but you are aware that some men complain about anything and everything.

12,790. What is your opinion with regard to that?—My opinion is that it is just and right under the present circumstances.

12,791. On what ground?—Simply because the men do not appreciate the scheme at all; and I know by experience that some of them do all they can to hinder it, so that it may not be made a paying thing. So that I think it would be hardly fair if these men participated in the bonus, at least not to an extent equal to the shareholders.

12,792. In short you look upon the present plan as desirable as being an encouragement to persons to take shares?—Yes I do. As soon as ever the men are known to appreciate it.

12,793. Do you find that this system has encouraged habits of providence and industry among the men with whom you have associated?—It has.

12,794. Do you see a marked difference in that respect?—I do.

12,795. They appear to receive at the end of the year a bonus of something like 5*l.* or 8*l.*?—Yes.

12,796. How is that usually disposed of; do you find that it is put by in the savings banks, or how do you find that it is generally disposed of by the men?—By some of them it is put by, by others it is spent foolishly. By a majority of them it is spent wisely.

12,797. Do they receive it usually in a lump sum at the end of the year?—They do.

12,798. Occasionally is it paid by the week during the following year?—No; the wages are paid by the week, but the bonus by the year.

12,799. But sometimes is it not paid in weekly sums during the following year?—Not the bonus.

12,800. It is always paid in a lump sum?—Always in a lump sum.

12,801. (*Mr. Roebuck.*) What was the state of the men's minds before the new system was introduced with regard to their masters; was there a good feeling between them or not?—I think if I say as bad as it could be I should be as near the mark as I can get.

12,802. What was the cause of its being as bad as it could be?—Disaffection; the disputes that arose frequently.

12,803. What did the disputes arise about?—About wages.

12,804. Had you any dispute with your masters about wages where they would not agree to what you wanted?—Certainly.

12,805. Will you give me an instance of that, because that is exactly what I want to learn?—In 1858 they gave us a notice for a reduction of 15 per cent. Of course they said that the concern was not paying them, and we said it was. That is a problem that I think it is highly important should be solved. You may remember that colliers always say it pays and masters always say it does not. We wanted to ascertain whether it does or not. Our employers in 1858 gave us a notice of a 15 per cent. reduction. We resisted and would not submit to it.

12,806. Had Mr. Brown been down at that time?—He spoke once or twice about that time. I remember sitting on the platform two or three times with him then; that was all, I think.

12,807. Had you ever any dispute before he made his appearance?—Oh! certainly.

12,808. And the dispute was not settled to your satisfaction?—No.

12,809. And that led to this ill feeling?—That was one thing, but they had other things before that. In 1853 there were things that led to it. I refer more especially to that which affected the district generally.

12,810. I want to learn from you the state of mind previous to the appearance of Mr. Brown?—I do not think that the state of mind has altered much since Brown made his appearance. Certainly, he has done what he could in defence of the men, and perhaps not always advised them for the best. I do not think he has. You know that I am one of those spouters myself, and of course I must defend him a little bit.

12,811. You fancy that the state of feeling was as bad as it could be before the appearance of Mr.

Mr. J. Pyrah.

25 March 1868.

Brown?—I do not think that it was as bad as it has been since, because the strikes were not on such a large scale before.

12,812. Were there strikes before Mr. Brown's appearance?—We had strikes before Mr. Brown's appearance.

12,813. When was the last strike before the appearance of Mr. Brown?—We have had so many that I can scarcely tell. I remember very well 1853 and 1844.

12,814. Then you do not entirely agree with the statement that the feeling between the masters and the men before Mr. Brown's appearance was perfectly amicable, that there was a good feeling between them, and that then all your objections were received calmly and quietly and kindly?—I do not quite follow that.

12,815. Let me ask it in this way: it has been stated that before Mr. Brown made his appearance there was an entire good feeling between the men and the masters. I want to know whether you agree in that?—I do not.

12,816. I want you to state why you do not?—Because we have had strikes and we have had disputes before ever Brown made an attempt to say anything to the district.

(*Mr. Henry C. Briggs.*) Brown first made his appearance in 1858. He was a leading man then, but he was not a spouter till 1863. He was then appointed a paid delegate.

12,816*a*. (*Mr. Roebuck, to witness.*) I want to know what was the state of feeling between the masters and the men before Mr. Brown's appearance?—We had disputes before, just as we have had since.

12,817. And all the obstructions to the working of the mine that have occurred since Mr. Brown's appearance existed before his appearance?—Yes.

12,818. Then amongst other things, it was said that the feeling of the men towards the masters was different, that they were kindly disposed one towards the other before Mr. Brown's appearance, and that afterwards they were insolent and insubordinate; do you agree with that?—That refers to Derbyshire, and perhaps it might be so there, but it was not true with reference to us.

12,819. Then you say distinctly that the ill feeling that there was between the masters and the men began before Mr. Brown's appearance?—Certainly.

12,820. You think that the feeling of the men towards their masters was somewhat wanting in that kindness which has been described as existing sometimes?—It was.

12,821. Because it has been said here that before Mr. Brown's appearance it was "How do you do?" and "I hope you are well," and so on; but that after his appearance it was not so, but they shouted?—There were agitators on the field before Brown.

12,822. Then the previous insubordination might have arisen from these previous agitators?—Part of it, no doubt, would.

12,823. Then a further statement was made, that you were asked what your objection was to the present state of things, and that the sole objection was that you were not permitted to go into the union; do you agree in that statement?—We have had nothing at all of that at Whitwood; you are thinking of another district.

12,824. (*Mr. Hughes.*) Did the Messrs. Briggs ever prevent their men from paying to the union?—No; we could pay when we liked. I never remember a single instance when they interfered with us on that matter whether we did or not.

12,825. With respect to the subjects of difference with your employers in those early times, sometimes you won?—We did.

12,825*a*. Did you win in 1858 in the 35 weeks' strike over the 15 per cent. reduction?—We won and lost.

12,826. It ended in a 7½ per cent. reduction?—Yes.

12,827. Do you think you were in the right then?—I do.

12,828. (*Mr. Roebuck.*) You submitted to 7½ per cent. reduction?—Yes, in the long run.

12,829. Did you object to any reduction in the wages when they asked for a reduction of 15 per cent.; did you say that there ought to be no reduction?—We did. I made a proposition to the men that we should divide it. The second day, after the notice expired, (it was a partial strike in the first instance) I made a proposition to the men that we should try to compromise matters. They did not shout me down; they tried, but they could not. I told them that if anyone spoke I would speak that day, or there would be no meeting. Of course, under those circumstances, they heard me.

12,830. (*Lord Elcho.*) When you say there would be no meeting, how would you have prevented a meeting?—I would not have let anybody else speak.

12,831. How would you have prevented him?—There were a few friends of mine there, and if they shouted we should have shouted. It was an out-door meeting, and I thought we could prevent them as well as they prevent us.

12,832. (*Mr. Hughes.*) Then, in fact, you were the leader of that strike?—Certainly I was. As long as I had taken up weapons I would not desert my cause. I contended for what I believed to be the rights, and believe still to be the rights, of the men, and for a long time we were at it. And then we were very glad to take what I believe we could have got at the outset, that is 7½ per cent.

12,833. (*Mr. Roebuck.*) If you had gone to the Messrs. Briggs, who had asked for 15 per cent. reduction, and had said, "We are quite prepared for 7½ per cent. reduction," you think that they would have yielded?—Yes.

12,834. But you did not; you went for the whole, and the result was that they gained 7½ per cent. depreciation, and you prevented the 15 per cent.?—Yes.

12,835. (*Mr. Hughes.*) But you got the other 7½ per cent. back in 1859?—Yes; so that this contradicts a statement made yesterday. It was distinctly stated yesterday that all the blame was to be attached to the leaders. Now I was the leader of that strike, and I could not lead the men. So that it is not strictly true.

12,836. The leaders cannot lead the followers?—They cannot, and I believe the Commissioners could not have led those men.

12,837. (*Lord Elcho.*) How long was that strike?—35 weeks. I believe the Waterloo colliery stood nine months.

12,838. (*Mr. Hughes.*) What do you think it cost you?—Why a good deal more than we gained; but we won.

12,839. (*Mr. Roebuck.*) During that strike did you and the rest of your fellows undergo great privations?—We did.

12,840. And those privations were felt by your families as well as yourselves. Amongst those privations was one the cessation of all education of your children?—To a very great extent, it was.

12,841. And I suppose that you had not much even of good food; that you had to restrain yourselves in food to a certain extent?—There were many that could not get bread. I think that we had one week only 10*d*., and you may judge what a family could get for 10*d*.

12,842. Were you at all supported from outside, from other unions?—There was not much union in existence at that time.

12,843. Were you supported from anybody outside?—We were.

12,844. Were you supported at all by other masters?—Not that I am aware of. I do not know that we were supported at all by the masters in any shape or form; and having no organization then, of course it was mere charity that we got; there was no claim, because we had not much union. We fought as good

a battle without funds, for anything I know, as has ever been fought since with them.

12,845. Did that strike engender ill feeling on the part of the men towards the masters?—Very bad.

12,846. That ill feeling existed, I suppose, up to the introduction of this new system?—It did; it was very bad indeed.

12,847. And I suppose that the agitator, Mr. Brown, worked upon those ill feelings?—No question about that.

12,848. And I suppose you did in your way?—Certainly.

12,849. (*Mr. Hughes.*) Then the 1863 strike, I suppose was more bitter than the 1858 strike?—It was. They had more funds to fight it on, and I am sorry to say that they did not fight it as honourably as we did in 1858.

12,850. With respect to the 1863 strike, that was as to riddling, was it not?—Yes.

12,851. Did you think it fair that the men should riddle down below?—Yes.

12,852. Then you did not lead that strike?—No.

12,853. (*Mr. Roebuck.*) Then you allow that though the causes of the quarrel were very much less in the strike of 1863, that strike was more bitter than the strike of 1858?—Yes.

12,854. Why was it more bitter?—I cannot say.

12,855. Cannot I suggest why—that Mr. Brown was there?—Of course he did all that he could; he was paid for it.

12,856. I suppose you do not know how Brown was paid?—He would have so much a week out of the funds of the miners.

12,857. Did you, I do not mean you particularly, but your union, contribute to those funds?—Certainly the union did contribute to those funds.

12,858. Therefore you and the rest of you paid Mr. Brown for his exertions?—Yes.

12,859. And those exertions were employed to exasperate the feelings between master and man, when the real differences were very much smaller than they had been?—Not exactly so. We paid Mr. Brown for advocating the rights of the men, we did not wish him to exasperate the feelings of the men.

12,860. Whatever the intention the result was that he was paid for exasperating their feelings about a matter smaller than that which caused the strike of 1858?—Yes.

12,861. (*Mr. Booth.*) Did the union express any disapproval of what Brown had done at that time?—Not that I am aware of.

12,862. On this occasion, when you say that he was paid by you, what he did was done with their approbation?—Just so.

12,863. (*Mr. Hughes.*) With respect to the payments, are the leaders always paid on those occasions?—Not always.

12,864. What were you paid?—Nothing. I did it gratis.

12,865. You did your commanding-in-chief gratis?—Yes. They offered to give me 4*s.* a day, but I said, "No, we will all share alike."

12,866. (*Mr. Roebuck.*) When you found that the masters objected to any of your demands, did you yourselves, upon careful investigation, learn that it was because those demands of yours could not be secured with due consideration of your real interests?—They have always listened to us courteously when we have appealed to them. But as with the men so with the masters. We got bound together with the men, and the masters got bound together with the masters; so that individual action was to a great extent destroyed.

12,867. Do you think that you knew better than the masters what was really for their interest as manufacturers, because you know that manufacturers must look to their own interests as you do to yours?—We have an equal right.

12,868. Do you think that you have an equal capacity of judging accurately?—I do not. I never did, and that is one reason why I hailed this scheme with so much pleasure.

12,869. Since you had this scheme, have you ever learnt that you made mistakes when you were simply acting as a workman?—Certainly.

12,870. Then you think that this new scheme has opened your eyes and made you feel something like a capitalist?—It has.

12,871. And as a capitalist you have learnt now to appreciate the former resistance of your masters?—To some extent. I am not convinced now that we were always wrong.

12,872. (*Mr. Hughes.*) In the old time had you any power whatever of ascertaining whether your demands were right or not, except by trying a strike?—We had not.

12,873. (*Lord Elcho.*) Did you take any means of ascertaining that?—We had frequent meetings and sent deputation after deputation to the masters.

12,874. You have stated that when the masters took off 15 per cent., in your opinion you were justified in resisting that reduction?—Yes.

12,875. What were the grounds that justified you in resisting it, in your opinion?—I stated at the time that we could not afford it.

12,876. By that you mean that you would be deprived of so much in the way of conveniences or necessaries?—Yes.

12,877. But did you consider at all whether the masters could afford to maintain the existing rate?—We did not.

12,878. As a rule, and from your knowledge of strikes, do you think that those who struck previous to the establishment of such a concern as this really considered the question whether the masters could afford, in justice to their capital and to their men, to give the wages demanded?—I do not think they did.

12,879. (*Mr. Roebuck.*) They wanted a rise of wages?—Yes.

12,880. (*Mr. Booth.*) It is merely a question with them which is the strongest?—Yes.

12,881. (*Mr. Hughes.*) Surely you have known occasions when there have been consultations amongst the men as to whether trade would be likely to allow an increase?—Certainly we have considered these matters, but we have always had a reluctance to a reduction of wages.

12,882. (*Mr. Roebuck.*) When the wages were asked to be reduced 15 per cent. had you not had a rise of 30 per cent. very shortly before?—We had.

12,883. And in spite of that when the masters asked you to reduce 15 per cent. you said, "Not at all"?—Yes.

12,884. Do you think, considering all things, that that was really wise conduct on your part?—I think it was.

12,885. Will you state why you think so?—In 1844 I believe the average earned by the men in the mine was 2*s.* 3*d.* a day. Now we should have to get two or three 30 per cent. rises before it got up to what it is now, 6*s.*; and I think that 2*s.* 3*d.* for a working man is not enough, and it was not then; therefore I thought, and along with me the rest of the men, that when we had these advances we ought to keep them.

12,886. Let me ask you what do you mean by "not enough." If the masters cannot give you more and make enough to enable him to continue his trade, do you consider that your saying it is not enough for you is any argument?—Yes, I do.

12,887. Then you would have him to pay you when he could not continue his business?—I think that every man ought to live by his work. Bear in mind that we were not playing, but we were working every day. If we had been out of work or short of work that would have been another thing; but when a man is working every day he ought to live, and I maintain that in 1844 it was a question of living or not.

12,888. Then comes the question, could the master pay you more than he was paying you?—And we believed that he could.

12,889. (*Mr. Hughes.*) Is it not proved that he could by the rises that have taken place?—Just so.

Mr. J. Pyrah.

25 March 1868.

12,890. The masters have not been ruined by these rises?—They have not.

12,891. And the men are better off?—I think that the wealth of the country has been increased by them.

12,892. You told us that you hoped to encourage the miners to take shares in the new company. Has any arrangement been made to help them in taking shares?—There has. I got a share with paying 3*l.*, and I do sincerely think that all the miners on the ground might have got one as easy if they had been disposed to avail themselves of the privilege.

12,893. How did you get it?—The arrangement was that when a person had paid 50*s.* he was entitled absolutely to be considered a shareholder for the first year, and he had 12 months to pay it. I paid it up, and I got 7*l.* bonus then. Then I put another half sovereign to it, and that made me a shareholder. Some of the men are now paying 1*s.* a week to the union, which comes to 52*s.* a year; so that what they are now paying would have entitled them to be shareholders for the first year.

12,894. (*Mr. Roebuck.*) If they had ceased to be members of the union?—They had no occasion to cease unless they liked—they might have paid the 2*s.* a week if they had liked.

12,895. (*Mr. Hughes.*) Has not the company established share clubs?—We have share clubs at 1*s.* 3*d.* per week.

12,896. Are many men taking advantage of that now?—Many men, more especially the top men.

12,897. With respect to the work down below, do you think that the men generally watch one another carefully, and see that the work is done well?—They do quite different from what they did; they are more carefully watched than they were. I am very happy to say that with some of the men there is a decided improvement, and I believe a great saving too. I do not say that they are all alike. There are some dead against it, as they were at the outset.

12,898. (*Mr. Roebuck.*) Have you any notion why they are dead against it?—I think it is because they think it was instituted to destroy the union; that is my firm conviction.

12,899. Supposing it was established to destroy the union, which I suppose it was, how would that do any harm to you?—If I can get any better thing than unionism I will get it, and I am only sorry that miners generally are not willing to take another thing because it has a different name. I believe it will do what the union cannot do.

12,900. When Mr. Brown came down there, what did he promise you and tell you would be the result of your union?—Well, he never promised me much. Since I talked to the men myself I have not troubled myself to hear Brown.

12,901. You do not like to hear another orator, perhaps?—Brown and I are very good friends. I believe he has misled them sometimes.

12,902. You do not know what he promised?—No.

12,903. (*Lord Elcho.*) What did you promise?—To keep as well as we were, and better if we could get it.

12,904. (*Mr. Roebuck.*) You did not point out the way?—I did. The way was to refuse to work at a reduction of wages.

12,905. You were determined to go through all the hardships of a strike without really knowing whether you were wise in beginning that strike?—Yes, just so; we considered that the end would justify the means.

12,906. And you sought the end, not knowing anything about the means?—We did.

12,907. (*Mr. Booth.*) On the occasion of these strikes did you confine yourselves to refusing to work, or did you take any steps to prevent other persons from working?—We did not. I believe that all who know me will bear me out in saying that I was very much opposed to violence of any description either to person or to property, because I believe that it damages a cause instead of helping it on.

12,908. Were any steps taken to persuade other persons not to take work?—Certainly, all the moral arguments that could be used were used.

12,909. But as far as you were concerned you counselled them to abstain from violence?—Yes.

12,910. (*Mr. Roebuck.*) How many did not follow your advice?—A few, but not many in 1858.

12,911. In 1863, how was it?—I was not then their adviser. I am not aware that they were advised then in any possible way to commit violence.

12,912. (*Mr. Merivale.*) With the experience that you now have, supposing Messrs. Briggs's scheme were out of the way, would you be of opinion that the men in your trade would be better off with a union than without it?—I think better with it, unless the masters ceased their union. If the masters' union ceased, I should say let every other cease, but one I consider as important as the other.

12,913. (*Mr. Hughes.*) But supposing that this plan were out of the way and supposing that there were neither masters' nor men's union, would you be for combination amongst the men in one pit?—Certainly so.

12,914. Then you would keep up the union as far as the men in one pit are concerned?—As far as that goes certainly. What defence else have we for wages?

12,915. (*Mr. Roebuck.*) Did you ever hear what Mr. Brown's opinion was as to this new plan?—Yes. When it was first inaugurated he spoke very laudably of it, extolled it, and said it was the very thing that was wanted. I believed in the thing, and I was very glad that he had taken such a favourable view of it. But the next thing that I heard of him was that he had turned round and said that he had not examined it properly before, and now, in looking better into it, he cautioned the men and wished them to be careful before they took any steps, and at the meeting following that he said he would not say that they would rob the men of the money, but something of that sort. He meant, I suppose, that the money would never come back.

12,916. Have you any idea what induced him to change his opinion?—More than one thing, I think, perhaps might induce him. One thing was, I believe, that one of our pits, the pit that I worked in, was dead against the scheme, more dead against the scheme than the other, and he had been in communication with those men. And I believe that he had been in communication with the principal leaders of the union and they were dead against it. Those were two reasons.

12,917. Let me suggest to you a third reason, and ask you whether that had not something to do with it, would not his profits have been very much struck off by this new system?—Certainly they would.

12,918. Though he may be a disinterested man, that may have something to do with it?—It is very natural that it should be so. It influences the best of us.

12,919. (*Mr. Hughes.*) Was Brown a working miner?—He was a working miner before the 1863 strike.

12,920. (*Mr. Roebuck.*) What sort of a workman was he?—He was a very good man when he was working at the coal. You must remember that colliers are always glad for anybody to advocate their cause, because there are so few amongst them that can, and Brown came to hand.

12,921. (*Mr. Hughes.*) Do you think that he could have got work as a miner after he had taken part in that 1863 strike?—I do not know; certainly the feeling was bitter against him in that district.

12,922. (*Mr. Roebuck.*) Did he succeed as a greengrocer, which we have heard he was for a time?—For anything I know. He left that before the 1863 strike.

12,923. You do not know whether he succeeded?—No; I have been to his house.

12,924. (*Lord Elcho.*) Some papers have been shown to us, showing that Brown had been in receipt of sums varying from 6*l.* to 9*l.* a fortnight; do you

know anything of that?—But if you come to examine it you will find that he was not paid much the week before. Supposing he has 6*l.* for a fortnight, that gives him 35*s.* a week, leaving him 25*s.* a week for travelling expenses.

12,925. Do you think that, Brown has made more by lecturing than he would have made if he had been in the pit?—I should almost think he has, and I think he ought to have if he has not.

12,926. Do you think that, without going into the question as to whether he could or could not have got work after 1858, the fact of his making more by lecturing than he could have made by mining is a sufficient reason for his not working as a miner?—Of course he has his labour to sell, and he sells it in the best market.

12,927. Why did you decline when you were offered to be paid as an agent?—I declined on these grounds. Miners at the best are one-sided after all, (I wish to state the whole truth) and I believed that I could not keep a clear conscience if I were paid for advocating the cause. They would either go their own way or not at all, and if I would go with them, I must either violate my conscience of right or cease to be an agent.

12,928. (*Mr. Hughes.*) They would not have you unless you would go the whole way?—Not for long.

12,929. (*Mr. Roebuck.*) Then they employed you rather as an agent to expound their views than as a leader to advise them on the best cause to adopt?—Just so.

12,930. (*Lord Elcho.*) You said that there were other agitators in the field before Brown; whom did you refer to?—I was one.

12,931. Were there any agitators who came to Messrs. Briggs' pit from other parts?—Yes, my friend Toft, who will give evidence to-day, was another. He was a paid agent in 1844.

12,932. Where did he come from in 1844?—From Seacroft.

12,933. Was there a union there?—I think there was then.

12,934. Was there one at your pit then?—Yes.

12,935. And at that time there was no dispute, was there, in your own colliery before Toft came there?—Yes, we had several disputes. He was merely a travelling preacher, and they sent him from another place.

12,936. Why did they send him?—He went according to a plan made by the union.

12,937. (*Mr. Roebuck.*) I want you to inform me of this. There was something alleged about danger in riddling; can you explain that to me?—I cannot explain it any better than by saying that it was all nonsense. I remember that being mentioned at the time. That was in the 1863 strike; it was said that it was very unsafe to riddle coals in the pit. If I had been asked I should have said that it was unsafe to shovel them, because we know perfectly well that a shovel makes more noise than a riddle. When a person is getting coal, coal may fall on him, but when he is riddling he is away from the coal and it cannot fall, so that there is actually more danger in getting than in riddling coal.

12,938. Was there any supposed danger from fire being propagated by the men striking against stone or anything of that sort?—No, the danger was of the top falling during the time that they were riddling; that was the idea, and a very lame one it was.

12,939. (*Lord Elcho.*) Are you yourself, as working in the pit, now paid by the piece or by the day?—I am paid by the day at present, and was in 1863; but there is a good deal of piecework.

12,940. After the establishment of this co-operative system by Mr. Briggs, did you hear any dissatisfaction with it expressed before Mr. Brown came; before Mr. Brown, as you stated, had made up his mind that the thing was wrong?—Yes; the men have always been dissatisfied with what was not called union. They have got a sort of predilection for union, and of course their leaders indoctrinated them in that, so that it will take some time, however good the scheme may be, before that is remedied.

12,941. (*Mr. Roebuck.*) As to your own position now, are you better pleased with your own position now than before?—A good deal.

12,942. Is a portion of that pleasure derived from the friendly relation between you and Mr. Briggs?—Yes.

12,943. It is kindly now, but formerly it was antagonistic?—Yes. The first time that Mr. Briggs mentioned it to me, I said, "It is the very thing wanted." I may say that I have had a desire for 14 years to sit where I sit to-day, to tell Government something on this matter. Trades' unions must undergo a change or there cannot be peace. I think that I have turned the thing inside out, and up and down, in all ways that I know, and I cannot see how there can be peace except by something being done. I for one am not afraid to entrust my interests in the hands of Government, but I believe that something must be done. I believe that in this system we have found a remedy for strikes and lock-outs. The feeling is quite altered. There is a hostile feeling yet, which will take years, I believe, to cure; but we are progressing, and things are widely different from what they were two years ago.

12,944. So that in your opinion the kindly feeling is growing?—Yes.

12,945. And your own life is rendered happier by this present system?—Very much so. Unionism, as it has been carried out amongst us, has been anything but pleasant. I am certain that it produces a great deal of misery; in families it has, and in churches it has. Those are the grounds on which I take my stand. I have seen a great deal of what ought not to exist in churches arising from difference of opinion in the union; and I am sure that something ought to be done in order for men to live comfortably together.

12,946. Allow me to ask you have you a family?—I have a family of eight.

12,947. How old is the youngest?—The youngest is ten.

12,948. A boy or a girl?—A boy.

12,949. Does he receive any instruction?—Yes, he goes to a day school.

12,950. How is that school supported?—It is a national school.

12,951. Have you better means of supporting your school now than you had during the union time?—We have the means of paying for it better now.

12,952. Of course the money which you then paid to the union you now pay to the education of the child?—Just so.

12,953. (*Mr. Booth.*) Considering what you have paid to the union from time to time, and what you have lost during such strikes as you have been a party to, do you think that, on the whole, pecuniarily, you have been a gainer?—I think I have been a gainer. I cannot see how we could have maintained our ground if it had not been for the union.

12,954. But as a matter of calculation, considering the loss during the long periods that you were on strike, and considering also the expense in subscribing to the union, and then considering the addition made to your wages, do you think that you have gained?—I think as an individual I may not have gained, but I could not act in an individual capacity.

12,955. I am asking how it has affected your individual case. You think that, on the whole, it has not been attended with pecuniary profit to you?—As an individual I think not. I do not mean to say that the union has not done good.

12,956. (*Mr. Roebuck.*) You know perfectly well the mind of your fellow-men. Do you think that they have instruction enough to govern a pit of this sort; do you think they could do it?—To manage? I think they have not. I should not like to try at any rate. Once the thing was begun, we determined to have a co-operative pit of our own. We seemed in good earnest. We got 1*s.* a week for 15 weeks

Mr. J. Pyrah.

25 March 1868.

subscribed, and then the men quarrelled and divided the money.

12,957. (*Mr. Merivale.*) How long did that go on altogether?—For 15 weeks. They paid 1*s.* a week for 15 weeks. I was treasurer, but some of them were dissatisfied, and they appointed a fresh treasurer. I said, "Do not let the thing die because I leave it." But they never paid any afterwards.

12,958. (*Mr. Roebuck.*) With reference to a question asked by one of the gentlemen here, do you think that if the men were to form a society of this sort without any advantage from the knowledge or assistance of capitalists or masters, they could govern a pit?—I should not like to work in it. We have not abilities capable of managing, that is the plain matter of fact. And it cannot reasonably be expected.

12,959. (*Mr. Booth.*) You would not like to stake any money in such a scheme as that?—I should not.

12,960. (*Mr. Roebuck.*) Therefore you do not think it wonderful that the masters should not like to stake money in it?—I do not.

12,961. (*Mr. Merivale.*) Do you think such a pure co-operation, as it has been termed, would work if you could muster money enough among you to engage a manager?—I question it very much.

The witness withdrew.

Mr. J. Pickles.

Mr. John Pickles examined.

12,962. (*Mr. Hughes.*) You were the secretary of the union, were you not, during the 1858 strike of which we have just been hearing?—Yes.

12,963. Of the general union?—Of the Methley and Wakefield district, as it was called at that time; they call it the West Yorkshire district at the present time, and it extends a little farther over into the Bradford part of the district.

12,964. Do you remember the proposal being made for a reduction of 15 per cent.?—Very well.

12,965. Were meetings called by your union?—Yes.

12,966. Did they take into consideration to the best of their ability whether such a reduction was fair or not?—They did.

12,967. What conclusion did they come to?—They came to the conclusion that it was not fair.

12,968. Do you remember the grounds on which they came to that conclusion?—The principal ground, I dare say, would be the men's objection to having the price reduced.

12,969. Did they consider the price of coal, and try to reckon whether it was reasonable there should be a reduction?—As to the price of coal we did not bother so much about that; we looked upon it in this light, that if the price of coal was not sufficient it ought to be more.

12,970. You thought that it was for your masters to raise the price of coal rather than reduce your wages?—Yes.

12,971. (*Mr. Roebuck.*) Did you think that your masters could raise the price of coal?—If they were all agreeable.

12,972. If all the world were, you mean?—Even if all in that district were.

12,973. Even if the customers would not pay it?—The customers are obliged to pay it or go somewhere else at a further distance.

12,974. If by going somewhere else they could get it cheaper, do you think they would buy your high-priced coal?—No.

12,975. How could the masters raise the price then?—I think they dwindled down the price amongst themselves by giving a larger quantity of over-weight—one master would give 21 cwt. to the ton, and another 22, 23, or 25 cwt., as the case might be.

12,976. Do you think that that affected or came to the knowledge of the consumer. When I bought a chaldron of coal did I not ask where I could get coal cheapest?—The consumer would make inquiries where he could have it cheap of course.

12,977. Supposing that he could get it cheaper somewhere else, do you think that the masters had control over the price?—To some extent.

12,978. How?—Because he could not get it cheaper in a district further off, owing to the expense of carriage that the extra distance would cause.

12,979. You see you have gone from the first statement. Supposing he could get it cheaper in the other district, how do you suppose that the masters could control the price?—I do not see that they could then.

12,980. Then do you not see that your first step in your strike was a mistake, namely, to suppose that your masters could control the price?—We thought that they were getting a sufficient profit.

12,981. Do not you see now that you made a mistake?—Of course we made some mistake.

12,982. (*Mr. Hughes.*) Did you make a mistake—did you not save a portion of the reduction?—Yes, we saved half of it, and got the other half in three months.

12,983. (*Sir D. Gooch.*) What interest could the master have in getting a low price if he could get a high one?—It would be his interest to get as high a price as he possibly could.

12,984. He would naturally do so?—Very naturally.

12,985. (*Mr. Hughes.*) Was there very great competition amongst the masters in the district at that time?—I cannot say as to that.

12,986. What do you suppose was the reason for that reduction of 15 per cent.?—I never saw any reason, we were not working very short time then.

12,987. (*Mr. Roebuck.*) Did you not ever look at the state of prices in the market?—No, we did not trouble ourselves about the market price of coal.

12,988. But is it not that which determines what the master can get for it?—Yes.

12,989. And you did not trouble yourselves about the market price?—Not very much.

12,990. Do you think, then, that you were in the right way of determining what a master can do?—We always supposed that the masters were getting large profits.

12,991. What grounds had you for supposing that, if you did not look at the price of coals?—Even if we did that we should not ascertain their profits.

12,992. (*Mr. Hughes.*) Did the masters ever offer to show you their books?—Never.

12,993. (*Mr. Roebuck.*) If they had offered to show you their books do you think you could have understood them?—Possibly some might.

12,994. Do you think one in a hundred of the men would?—No.

12,995. (*Lord Elcho.*) Do you think Mr. Brown would have understood them?—No.

12,996. (*Mr. Roebuck.*) You are perfectly well aware of the state of mind of the working men before this new system?—Perfectly.

12,997. What was their state of mind towards their masters before the new system?—Very bitter indeed.

12,998. Was it very bitter about the 1863 strike?—Yes.

12,999. You had been in the former strike, had you not?—I was in the 1858 strike.

13,000. And then you had certain causes which induced you to strike, and you had further causes which induced you to strike in 1863?—Yes.

13,001. Do you think that the causes in 1863 were equal to the causes of the former strike?—No.

13,002. But the feeling was the more bitter?—Yes.

13,003. What induced the greater bitterness on that occasion if the causes were less?—I cannot exactly say.

13,004. Was not there a Mr. Brown there?—Yes.

13,005. Did not he rather exasperate the minds of the people?—I dare say he did.

13,006. Do not you think that you might assume some of the causes to be due to Mr. Brown's eloquence?—No doubt he would irritate the feelings of the men; but if there had not been Brown to irritate them there would have been somebody else.

13,007. Then you think that they were ready to be more irritated than in 1858, even though Brown had not come there?—Yes.

13,008. Then you will allow that they were not in so reasonable a state of mind as before?—No, they were not; they had not so reasonable ground as they had before. But it might be reasonable enough for all that.

13,009. Since the introduction of the new system, has there been in your opinion a change of feeling?—Very much so.

13,010. I suppose from what I should call the bitter feeling, there was a more kindly feeling between the men and the employers?—Yes.

13,011. And the confidence of the workmen in the new system, I suppose, is great?—It is growing; it is not very great yet.

13,012. They have more faith, in fact, that they can look after their own interests and see that they are not cheated?—Yes.

13,013. Does that arise from the fact of their being participant in the working of the system?—Yes.

13,014. And that they can really look into the books if they please?—I suppose the shareholders can.

13,015. Do you think that a certain portion of the working men being shareholders increases the confidence of those who are not shareholders?—I dare say it does.

13,016. Do you suppose that that increased confidence arises from the fact that they know that the shareholders can, if they please, overlook the working of the whole affair?—I do not know whether it may arise from that or not, most likely that will be one reason.

13,017. (*Mr. Hughes.*) Then the bonus, I suppose, is a great reason?—Yes, that is a great reason. Before the bonus was paid they had not the least confidence that it would be paid.

13,018. Do you approve of the shareholders having a double bonus compared with the non-shareholders?—Oh, certainly.

13,019. (*Mr. Roebuck.*) Because you are a shareholder, I suppose?—No, not for that.

13,020. But you are?—Yes.

13,021. (*Mr. Hughes.*) Tell us why you approve of it?—Mr. Briggs scarcely suited me yesterday with that. He attributed it to mercenary motives. I deny that altogether.

13,022. Let us hear it, your reason, because I am rather on Mr. Briggs's side as to that, and I am a shareholder?—We think that if we can get the men to take up shares, it will add to the stability of the concern, and if we can induce a man to take up one share it might have a tendency to induce him to take up more. That will mend his position in society, besides giving him a larger bonus. That was my proposition when it was started. I proposed it myself to Mr. Briggs, and it was done with the intention of stimulating the men to take up shares. I have put down a note or two on that subject this morning. I put it in this light to Mr. Briggs. Suppose the total wages were 40,000*l.* (they estimated that it would be 45,000*l.*, but I put it in this light to take less figures) and the bonus 2,000*l.*, I proposed to share one-fourth of this, that is to say 500*l.*, in the first place among the working shareholders and the remaining 1,500*l.* among the whole of the men irrespective of whether they were shareholders or not. Suppose then again, only one-fourth of the men took up shares during the first year, this plan of distributing bonus would give the working shareholders representing 10,000*l.* of wages 1*s.* 9*d.* in the pound, and the working non-shareholders representing 30,000*l.* of wages 9*d.* in the pound. Now I thought that this would act as a stimulant to the non-shareholder to take up a share, seeing that he could get 1*s.* more in the pound if a shareholder than he could if a non-shareholder. And we have always been able to meet them with this argument when they have grumbled about the shareholders having more than the non-shareholders: "If you do not like to stay down there, come up here." The difference in that case would be so great that I should expect a great many would be induced to come forward to take shares, so that if during the second year or at any other time three-fourths of the men had taken up shares this plan of distributing bonus with the same amount of wages and profit would give to the working shareholders 1*s.* 1*d.* in the pound, and the working non-shareholders 9*d.* in the pound. You see that there the difference is not so very much between 9*d.* and 1*s.* 1*d.*, but if they are not content to have 9*d.* then they have still a chance of coming up to 1*s.* 1*d.* When they approach nearer than three-fourths it gets less and less till when they are all shareholders it is share and share alike.

13,023. You want to make all the men in the pit shareholders if you can?—That is our object.

13,024. In fact you think that the present scheme will have much more the effect of compelling the men to come in as shareholders than if the bonus were more equally divided?—Yes. There is a good deal of talk at the present day about education, and I believe that a good many have come over to the compulsory system of education. I mean by this idea of mine, to use a little compulsory education with the miners. They do not understand the system properly, but if we can touch their pockets a little bit it might have a tendency to educate their minds up to it. I do not take a man to be a capitalist if he only takes up one share for the sake of getting the extra bonus, but if we can induce him to do that we might be able to induce him to look a little farther and take up another share for the sake of the extra dividend he would get. As soon as we have induced him to do it I think we have gained a great point.

13,025. (*Sir D. Gooch.*) You think that that feeling is growing?—Yes.

13,026. (*Mr. Booth.*) You said that the feeling of the men towards Mr. Briggs in 1863 was a more bitter one than in 1858?—Yes, very much more so.

13,027. At which of those two periods was the union more powerful?—During 1863. In 1863 they had some funds to fall back upon, but in 1858 they had no funds whatever. The union was only formed at the time the strike took place.

13,028. And it had become much more extensive in 1863?—Yes. Some time after 1858 it nearly dwindled away; it did smoulder certainly, but it revived again with more vigour in 1863.

13,029. (*Mr. Roebuck.*) Was there a rise of wages in 1863, or was trade going on very well in 1863?—I am sure I cannot say. I think that the trade was pretty good.

13,030. Do you think it was better than it was in 1858 when the other strike took place?—Well, I should say about the same; it had been very slack in the winter of 1861 and 1862, and part of the summer before, I believe.

13,031. Did not that bad state of trade rather exasperate the feelings of the working men, more especially if they did not know whether their masters were dealing fairly with them, and so were led to suppose the lowering of wages and the bad state of trade to be attributable to the masters?—We generally attributed it to the masters to some extent, one underselling another, and driving the trade away.

13,032. Then was not the feeling that the masters were in part the cause of the bad state of trade one cause of the increased exasperation in feeling towards them in the 1863 strike?—It might be.

13,033. You were appointed coal inspector, I think?—Yes. Some time during 1863, some very short time, I believe, before the strike of 1863, the men appointed me check weighman. They thought that the masters were imposing upon them in weighing the coal, and they appointed me check weighman as they

Mr. J. Pickles.
25 March 1868.

term it, that is to look after the master's weighman to see that he gave proper weight; and they paid my wages out of the union fund.

13,034. And who appointed you?—The men themselves.

13,035. Was there any doubt as to your behaviour on the part of the men; did they at all say that you did not look after their interests sufficiently?—Well, sometimes they did. It is a very difficult position to be placed in, being a servant of the men, I can assure you.

13,036. Because, I suppose, men are not altogether just to their servants?—They are not altogether reasonable.

13,037. Amongst the unreasonable men, did you find the union men rather the most unreasonable?—They were all union men that I had to deal with.

13,038. And they were very unreasonable?—Some of them; most of them in fact.

13,039. Were there coals worked by men not unionists?—Yes.

13,040. And did you look after their coals?—No, not exactly. Of course I could just see as well if their coals were weighed properly as the union men's coals; but I did not consider it my business to look after theirs.

13,041. In your investigations did you ever find any attempt to deal unfairly with the men in the weighing of the coals?—Never.

13,042. Neither with the non-union men nor with the union men?—Not by the weighman.

13,043. Or by anybody?—I never suspected the weighman myself. The weighman had had to weigh my coal when I was a coal getter, and I never thought that he dealt unjustly with me, and I did not think that he dealt unjustly with others.

13,044. Whom did you suspect of injustice?—I felt that the banksman was rather keen.

13,045. Could the banksman control the weighman?—It was the banksman's business, I suppose, when a corf was not properly filled, or if it were in any way deficient, to insist on part or the whole of it being forfeited. It was my opinion that he forfeited coals that he had no business to do; for very frivolous things he would take the whole of the corves.

13,046. Then on looking out for the weight of the coals, had you any control over the banksman?—Not the least.

13,047. So that your office in no way whatever made the banksman more honest?—I simply entered my protest, and it generally had just the contrary effect to doing good to the men.

13,048. Why was that?—If I protested against his taking the man's coal he would begin to take more coal.

13,049. Was there no control over him?—Messrs. Briggs had control over him.

13,050. Did you ever complain to the Messrs. Briggs?—Yes, I did.

13,051. And did you ever find your complaint had effect?—Yes, certainly. I entered a protest to Mr. Currer Briggs, and said it was quite an unreasonable thing for a man for the least thing whatever (if it had a good handful of dirt in, for instance) to lose the whole of the corf. That corf was worth something when that dirt was picked out; the remainder of the coal was worth just as much as if it had not any dirt in it. But the man had no right to be paid for that dirt. So I suggested to Mr. Briggs that he ought only to lose the amount of the spoil, and if he spoilt the coal to the extent of a hundredweight he ought to lose a hundredweight, and if to a greater extent, it might be two hundredweight or half a corf, but never the whole.

13,052. Was it the habit of that pit to forfeit the whole corf?—Yes.

13,053. Did any of your representations or remonstrances have the effect you desired with Mr. Briggs?—From my conversation with Mr. Briggs he made an agreement with me that for a large corf (we had two sorts of corves going at that time, some that held six cwt. and others that held nine cwt.) he would agree to take off two cwt. and for a smaller corf one cwt. Of course the amount of damage would vary, but we considered that it would cover the average amount of damage to each corf.

13,054. Then after that you think that you were fairly dealt with?—Yes.

13,055. So that the result of your examination was beneficial to the men?—Yes, the result of my intercession with Mr. Briggs certainly.

13,056. Then were you not appointed inspector and paid jointly by each side?—From that time we went on peaceably for a while, I cannot say how long, and then the men began to be dissatisfied even with losing their one cwt. and their two cwt.; they thought they were losing more than they ought, and I believe they applied to Mr. Briggs to appoint some one to inspect the coal instead of this banksman, to take it out of his hands altogether.

13,057. What occurred; what was the result?—After talking it over with them he consented that if they would nominate some three or four or half a dozen men, I cannot say which, he himself would select one from their number, and he would pay half his wages, they paying the remaining half.

13,058. And they selected, I suppose, some half a dozen men, and you amongst the number?—No, they began to think it over, and they began, I daresay, to think that after all they were not very much robbed in the way of weight, and they could do without somebody looking after the weighman, and it would entail an additional expense upon them to have two men, one to look after the weighman and one to look after the banksman, and they thought that if they could make arrangements to have it all in the hands of one person it would work much better.

13,059. Then I think that Mr. Briggs insisted that there should be some man, did he not?—Yes, I believe he did.

13,060. It was in consequence of that that you were selected?—When Mr. Briggs suggested that they should nominate some man they met him again after they had talked the thing over in the line that I have been showing you, and they asked him if he would allow me to take that situation instead of appointing some new man. I think Mr. Briggs was a little bit opposed to that. I do not know whether he thought that I had interfered rather too much in the concern before or not, but I believe he raised some objections. But, however, he agreed to try me for a stated time. I forget now whether it was a fortnight or a month, and at the end of that time he would give them an answer. And some time before the end of that time the manager, Mr. Robson, came to me and told me that I was regularly appointed to the situation.

13,061. (*Lord Elcho.*) In any adjoining mines has there been any question of establishing any system of the same kind as Messrs. Briggs's that you have heard of?—Not that I am aware of.

13,062. Have you heard any wish expressed in other mines by the miners that such a co-operative system should be established?—No, I have not heard any.

13,063. Do you think there is any general knowledge among the miners that such a co-operative plan is in operation at Messrs. Briggs's, and with success?—Yes, they do know that this is in operation, and that it is a success as well.

13,064. And if they know that it is a success why is it that there is no wish that such a thing should become general?—I do not know. I have not had much conversation with parties about the neighbourhood.

13,065. Have you heard whether throughout the country there are any agents that are speaking against it besides Mr. Brown in your district?—Yes, there are two agents in our district that speak against it.

13,066. Who are they?—William Ackroyd and John Dixon.

13,067. And do they confine their efforts against it to your district, or do they go about the country?—

They are chiefly confined to our district. They are paid by our district.

13,068. Do you know whether they lecture in any other district?—No, I am not aware that they do, except that they go away occasionally to render some assistance to others.

13,069. Do you know if any of the men in your mine who are opposed to this co-operative movement contribute to the payment of these men?—I think there are about 40 in the Methley Junction that contribute. I do not know that there are any at Haigh Moor or Whitwood.

13,070. There are 40 men in the Methley Junction who pay these lecturers who are endeavouring to prevent the extension of this system?—Yes, they subscribe to the funds.

(*Mr. H. C. Briggs.*) I expect the reason is that they live in Methley, which is quite a hotbed of unionism, and they do it more to keep peace with their neighbours than anything else.

13,071. (*Lord Elcho to the witness.*) Is it with the knowledge and sanction of the union that these men, Ackroyd and Dixon, go about the district and elsewhere endeavouring to prevent the spread of such a system of co-operation as this?—Certainly. They spoke against it at the Nottingham Conference in 1866, and I wrote to the chairman (Mr. A. Macdonald) to correct their misrepresentations. In acknowledging my letter Mr. Macdonald expressed a wish to have some further correspodence with me on the subject. There is another matter to which I should wish to refer before I leave, it might be attempted to be brought out in evidence afterwards, that the reason that we speak favourably of this system is because we have got situations out of it. Now I am not aware of anyone, except myself and another of the name of Pell, that has got a situation out of it.

13,072. (*Chairman.*) What do you mean by getting situations out of it?—I am not a working collier now, I am a storekeeper for the collieries.

(*Mr. H. C. Briggs.*) Mr. Pickles came out of the pit at the time that he was appointed check weighman. He has not been working underground since.

(*Witness.*) Pell was check weighman at the neighbouring colliery, and was one of the bitterest opponents of the Messrs. Briggs', not of the system, for I remember one time, after the prospectus was issued, attending a co-operative lecture and Pell was there. I attended that meeting expecting that this scheme of ours would be alluded to, and after the close I asked Pell his opinion. I said, "Now what do you think of it?" (he had been an old colleague of mine in 1858), and he said, "Well, the thing itself is good, but" he said, "you know it comes from Briggs, and I have no faith in Briggs." Since then his opinion has so far changed, and he was so far dissatisfied with his situation of serving the men (I have alluded before to the difficulty of doing that) that he came and asked for employment at the Whitwood colliery. He having been out of the pit and doing nothing his hands had naturally got tender instead of being horny, as working colliers hands are; and his brother being a quiet man, and a very steady workman, had some influence with the bottom steward to get him into an easier situation, that is to work day work for a short time till his hands got properly tempered, so that he should be able to get coal. Now, during the time that he was working day work, I believe he gave so much satisfaction that from that time to this he has been retained at that kind of work. Now, as to my getting my situation, I have already stated that I was appointed check weighman to the men. From that I passed to being an inspector paid half by the men and half by Messrs. Briggs. I found the situation getting rather uncomfortable, serving not two masters but 200 or 300, and I heard Mr. Briggs hint a time or two that they would require an extra hand in connexion with the new system, and just about the same time one of my best friends in the bottom said, "It is all up with you; I would advise you to seek work." I spoke to Mr. Briggs immediately about the situation, and he said that he did not know that they had anybody for it, and that he would take time to consider about it. I saw him some time after, and asked him again, and he said, yes, he thought he might let me have it, and just before the commencement of the working upon this new system I was appointed their storekeeper. From the very first I took up heartily the new system, and advocated it in whatever way I could among the men, and that I have no doubt worked to my disadvantage; the men turned against me, that is to say the majority of the men. I believe I was instrumental in inducing many of the bottom men to become shareholders, having a little influence over them, and I believe that at our place, the place where I was employed, there were more of the bottom men who took up shares than at the whole of the rest of their collieries put together.

13,073. (*Chairman.*) Is there any change in the feeling towards you now among the men?—The feeling is as good, a little better, I dare say, than when I was in their employment.

13,074. (*Mr. Roebuck.*) You have been storekeeper some time, I think?—Yes, since 1865.

13,075. Then you were storekeeper before and since the establishment of the new system?—Only a month or two months before.

13,076. Are you at all able to give any opinion about the saving of stores under the new system?—No, I am not acquainted with the quantity of stores used before the new system; but it would be a very difficult thing to arrive at any conclusion with regard to that. You see the stores go out both to compensate for wear and tear, and for opening out new works; whatever might be wanted of course it passes through the store room.

13,077. And when new works are established I suppose more stores go out, and therefore you cannot judge upon an average?—Just so. The stores will vary from about 5*d.* a ton on the produce to about four times 5*d.*, or 1*s.* 8*d.*

13,078. Have you been at all able to make up your own mind as to whether there is any check now exercised upon the men one upon another, as to economy in the use of stores?—I think there is.

13,079. You think that their check upon one another has tended to the increase of economy?—Yes, I think that some have been induced to practice economy from the working of the system.

13,080. Because the greater the saving the greater the chance of bonus?—Yes. It is a very common expression, for instance, in passing through the yard, if you meet with a bolt or a large nail, in picking those things up, to say "This is so much bonus saved;" and the same with the men in the bottom. They will sometimes get out a prop that is rather difficult to get out, and might have been left under other circumstances, and then they will turn over the expression, "That is so much saved towards bonus." I believe that that is becoming more general. In fact there was a very strong feeling against the present system at the beginning, and fears were entertained that the Messrs. Briggs would never act up to their promises, and those that did take up shares at the beginning were very much bullied; but I am very happy to say that the bullying has altogether ceased, as far as the bullying of shareholders goes. And with regard to the men not coming forward as they ought to do to take up shares I certainly blame Mr. Archibald Briggs to some extent for that. He hinted at the shareholders' meeting that the men ought to be paid equal bonus, and there were many that were thinking about taking up shares then that did not take up shares, thinking that they would be equally dealt with whether they did or did not; and there were others that had taken up shares and paid the 10*l.* who felt ready to sell out the next day.

(*Mr. Archibald Briggs.*) There was one who did sell the next day, but he has taken up another share now; and as he sold at 3*l.* premium and took up his new share at 2*l.* 10*s.* premium he did pretty well.

Mr. J. Pickles.

25 March 1868.

(*Witness.*) I was not there fortunately, or I could not have sat still, though I never was a spouter. We had a sort of indignation meeting about it afterwards.

(*Mr. Archibald Briggs.*) I should like to be allowed to add what passed at that shareholders' meeting. It was one of our largest shareholders who first suggested that if the bonus was the proportion of profit belonging to labour it ought to be divided among all, irrespectively of whether they were shareholders or not. I simply brought it out as a proposition, that it was the proper thing, and that I thought that eventually we should have to come back to that thorough co-operative system. I had a long argument with some of the men, who put it in this light: Did I think that they would slave to get a share simply to have a few shillings dividend? In fact, when they had been simple labourers and we had been the colliery proprietors they thought our profits enormous, but 12 per cent., or 13 per cent., or 10 per cent. now seemed to them very little, and unless they got a larger amount of bonus as well it would not be worth their while to become shareholders. All I said was that during the current year there would be no change made, but I could not promise about the future; the result of which was that some who intended to take up shares did not take them up.

(*Witness.*) The dividend on one share, although it may be 10 or 12 per cent., is a very trifling matter, and it is not a sufficient inducement for men to put themselves out of the way to save up 10*l.* Even suppose that it is 12 per cent., well it is 24*s.* in a year, and as it is paid up twice, it is 12*s.* one half-year, and 12*s.* the next; it is only a good day's wage for a good collier, and they look upon it in that light that it is not worth their while saving up a share for the sake of anything of that sort. But, if by any inducement (I do not care what it may be), we can get them to take up shares, the more shares they take up the more nearly we shall be alike, so that when they are all shareholders they will all receive bonus alike. And if at any time it should occur that the system was perfectly established, I should not have the least objection to the men sharing equally. But even as a question of right, it does seem very unfair for men that are reckless of the property, and doing everything they can to destroy the profit to share on equal terms with those I have mentioned, who pick up nails in passing along the yard, or who pull out props that the others would bury. It does seem to me very unfair that they should share and share alike.

13,081. (*Chairman.*) I do not quite understand you there, because we have been given to understand that the bonus acted as an inducement to them to save the master's property?—To some extent it does; but that does not act with everyone. No doubt it will have that influence upon all the shareholders and many of the non-shareholders as well; but there are a good many of the non-shareholders that are still as reckless in regard to stores or any sort of material as ever they were.

The witness withdrew.

Mr. J. Toft.

Mr. John Toft examined.

13,082. (*Chairman.*) You also are now employed by Messrs. Briggs, are you not?—Yes.

13,083. How long have you been employed by them?—I came into their service in 1862.

13,084. Since Mr. Pickles has raised the question in regard to himself, I will ask you at once whether you have any situation in this concern?—No, nothing at all but that of a common working collier.

13,085. Will you proceed with your evidence?—The scheme has done a vast amount of good. It has destroyed a vast amount of ill feeling, and I have not the slightest doubt that by perseverance and so forth it will have the effect of bringing the whole of the men round to our side—that is, to the side of the co-operative system.

13,086. You think that the men are gradually becoming satisfied that the system is working well for them?—Yes, I believe it will come to that. My opinion is that it will.

13,087. And do you think that it has encouraged among them generally industrious and provident habits?—Yes, I think it has already done a deal of good in that particular. Men that were reckless, and drunken, and such like, have begun to improve.

13,088. And you think that there is a better feeling between employer and employed than there was previously to the introduction of this system?—I am confident there is.

13,089. Before the introduction of this system had you any connexion with the trades unions?—Yes, I have been connected with trades unions ever since I was a young man. In 1844 I was one of their general agents, and we had a strike of long duration; the men were ultimately defeated, and there was a large amount of what we term black sheep, that is to say, hands from other trades brought into the workings, and they have never left it since. The men were entirely defeated in 1844, and the union fell down. Then in 1858 I was not so much connected with the strike; my opinion was that when the masters of West Yorkshire gave us a notice of 15 per cent. reduction, if we had divided it and proposed to them to have received 7½ per cent. we could have got it, and gone on, and I wrote two letters to that effect, one to the "Leeds Mercury" and the other to the "Leeds Times." They were generally applauded, and it was said that the reasons were good.

13,090. Were you agent for the union at that time?—No. I tried to dissuade the men from striking, and proposed to meet the masters half way. But they would not take my proposition, and instead they blacked me, and threatened to do me some bodily injury.

13,091. (*Mr. Roebuck.*) You said that you were a general agent?—Yes.

13,092. What does that mean?—I was a lecturer, if you will allow the honourable term.

13,093. And you went about as the general agent for the union?—Yes.

13,094. Did they pay you?—Yes, they paid me a guinea a week in 1844. When the strike had been a few weeks on hand they were very poor, and of course they brought those men down to 15*s.* a-week.

13,095. They paid you a guinea a week, and what were you to say; what were you to show, and what were you to prove?—I was to encourage the men all I could to continue the strike, and to beat the masters, and compel them to give us the 15 per cent. As I have said I received a guinea a week in 1844. At that time we wanted an advance of wages; it was not a strike against a reduction, but we wanted an advance throughout England.

13,096. And you went for the purpose of inducing the men so to act as to compel the masters to advance their wages?—I did.

13,097. What did you recommend them to do?—I recommended them to continue stedfast and beg rather than go to work at the wages they were then receiving.

13,098. Had you any ground for your belief that it was necessary and wise to advance their wages?—Well, it was my conviction that the wages were too low, as brother Pyrah has said, that we could not maintain our wives and children at that rate. My own wages for a year and two weeks previous to that strike, averaged, when the fire, coals, candles, and such things were paid off, 9*s.* 7*d.* a week. I am not one of the best workmen. I must have meat, but at that time my wages were an average wage of the men of the pit.

13,099. At the time of the strike of 1844, was there anything to induce you to believe that the masters were able to pay more than they were before?—I believe now that they could not conveniently give

more while the coals were not risen, but I did not think so then.

13,100. Since then experience has taught you that you were wrong?—Yes.

13,101. And all the money expended upon your eloquence was thrown away upon a mischievous purpose?—Yes.

13,102. (*Mr. Booth.*) You said that in consequence of the strike a number of new hands were taken on, were any steps taken by the union to prevent those new men coming to work?—There were. I did all I could without using violence. I persuaded, and so on, the men, if possible, to discontinue black sheeping work.

13,103. Did you succeed as to several of the men, preventing their being taken on to work?—In some instances we persuaded those that came from other counties to go back again, and those that came from other trades in our county we persuaded to desist.

13,104. Were there any outrages commited at that time. I do not ask whether you had any share in anything of that kind, but were there any outrages committed in reference to the new men that came there in 1844?—No, I think not; I do not recollect any.

13,105. No conviction before the magistrate?—No, I think not.

13,106. (*Mr. Roebuck.*) Were there any outrages committed in 1858?—Yes.

13,107. There was plenty of violence then, was there not?—Yes, but in 1858 I took no part with them.

13,108. In 1863 did you ever with your vehement eloquence describe Mr. Briggs?—Yes, I called him all that I could.

13,109. What did you call him?—I believe I said if he had horns on he would be the devil.

13,110. There is a brother lecturer now (I do not mean a brother of yours), a Mr. Brown; did you ever hear him?—Yes.

13,111. What has he said in your hearing?—He has said, I believe, as much as me; he has said a good deal.

13,112. Had he about as much reason as you had?—Why we were both alike for anything I know, only he was better paid than I was.

13,113. Well then, I suppose, being better paid he used harder language?—Well, in the first instances we were both alike.

13,114. Can you give me any specimens of his eloquence; can you tell us what he said?—Not particularly; but I know that he excited the men to a great degree, and perhaps sometimes when he was not aware that he was exciting them. But he is a very powerful man, and has a very powerful voice, and makes a great movement.

13,115. So does a drum, you know. When Mr. Brown came down, did he exasperate the feelings of the men against Mr. Briggs?—Well, I believe the words he said had a tendency to excite and to enrage; that is my candid opinion.

13,116. It has been told us before, that in the strike of 1863 you had really less cause for going out than you had in 1858; and that the feeling was very much stronger, is that your view?—Yes; we had less cause to go out, and the feeling was stronger. Perhaps it was partly my own agitating propensities and partly Brown's.

13,117. Since that there is come this change of plan; do you think that change of plan has tended not merely to soften your feelings but the feelings of other men like you?—Yes, I believe it has.

13,118. To what cause do you attribute that?—In the first instance the masters, I believe, had a desire to destroy the principle of fighting, or take away the cause of fighting, by making our interests and theirs identical. Now, seeing that we get a fair wage, as good wages as we could get in the neighbourhood, and in addition to that we get the bonus, and so on, we thought, and we thought rightly, that it would be a principle of healing, that it would have a tendency to destroy the war principle and the war spirit.

13,119. Before Mr. Brown came into the neighbourhood were there disputes between the men and Mr. Briggs?—Yes, there were occasional disputes.

13,120. How were they settled; were they settled amicably, or by what means?—They were sometimes settled amicably, and other times they were settled but still with the rankling of ill feeling.

13,121. Did you ever find that Messrs. Briggs were unwilling to listen to you?—No; but you know I had no connexion with them previous to 1863.

13,122. You had no connexion with those miners then?—Not with theirs; I was labouring in Leeds in 1858.

13,123. In 1863 did you join those men?—Yes.

13,124. When you joined what ground had you for believing that they were ill-treated?—I thought that they could afford to make it up at $7\frac{1}{2}$ per cent., my impression was then $7\frac{1}{2}$ per cent.

13,125. You thought that. What ground had you for thinking it?—I thought that the price of coal was not lowered to such an extent as to warrant them in taking the whole 15 per cent. off.

13,126. But since that you learnt that the price of coal was lowered?—But the dispute was ended with the $7\frac{1}{2}$ per cent. reduction, each side making a concession.

13,127. Your view then that they could afford to give wages only $7\frac{1}{2}$ per cent. less was grounded upon your view of the price of coal?—Partly so.

13,128. Can you tell me what the price of coal was at that time?—Not exactly; the best coals, perhaps, 8*s.* or 9*s.* per ton.

13,129. Your belief is now that, regarding the price of coal at that time, they could afford really to lower the wages $7\frac{1}{2}$ per cent?—Yes.

13,130. And for that reason you went out violently into strike. Now I want to know what the consequences of those strikes were to you individually?—They did me and that particular strike did me, a vast amount of injury. Previous to that strike I had four houses, they were not paid for, but I was going on with them and contributions were nicely and gradually bringing them down, and they would have been my own before now perhaps; but the strike commencing, and I not having a regular income (because they did not pay me as they paid Brown), as soon as ever I heard there was any complaint or grumbling in the district about me I threw drumsticks, or to put it otherwise, I resisted to speak for them. I am a man of independence, and would rather suffer than take money from the men.

13,131. You did suffer from the strike?—Yes. I lost my houses.

13,132. Have you any family?—I have only one child.

13,133. How old is that child?—Coming 17.

13,134. Was the boy in school in 1863?—No, he went to school until he was 12.

13,135. And after that he went to work in the pit, I suppose?—Yes.

13,136. And I suppose you not only suffered in the loss of your houses, but you suffered a good deal of bodily privation, did you not?—A good bit.

13,137. You did not get such good food as before?—Why no. I did not feel so well as I should have felt if I had continued working.

13,138. Being a rational man did you ever contemplate for yourself what benefit you could possibly derive from the strike?—Well, I did not always go on that; I did not like to be beaten.

13,139. You were not governed by reason but by passion?—Not always by reason.

13,140. Now that you look back upon it, are you not rather sorry that you did it?—It would have been far better if the principle had been inaugurated sooner, and if I had accepted it I believe it would have been better.

13,141. From your experience generally, do you believe that strikes and unions have done the working man any good?—I believe that speaking generally they have done them a vast amount of injury.

13,142. I suppose that they have not contributed to

Mr. J. Toft.
25 March 1868.

their moral habits, to their quiet demeanour, and obedience to the law, and good feeling towards their fellows, have they ?—No, they have not.

13,143. They have rendered bitterness much more common ?—Yes. They are a curse to the country ; that is my candid opinion.

13,144. (*Chairman.*) How much did you contribute to the union when you were in it ?—About 1*s.* a week.

13,145. What bonus did you get from the concern this last year ?—I got somewhere near 5*l.*, and the first year I got 5*l.* and a few shillings over.

13,146. Then you have been 7*l.* or 8*l.* to the good this last twelvemonth ?—With bonus and interest I shall have gained a good deal. I do not exactly know how much ; but a good bit.

13,147. Are you a shareholder ?—Yes.

13,148. What is your opinion of the arrangements under which the shareholders receive a larger bonus than the working men in the colliery who are not shareholders ?—Well, I believe that the extra bonus given to the men who are shareholders will induce others to take shares.

13,149. (*Mr. Roebuck.*) But is it your opinion that it is a wise plan to give the shareholders a larger bounty than the non-shareholders ?—I do believe it is.

13,150. (*Chairman.*) As an inducement to them to take shares ?—Yes.

(*Mr. Pyrah.*) I may say that my three sons and myself were shareholders in the first and in the second year, and we received for bonus exclusively during that time 24*l.* to my family.

(*Witness.*) Perhaps I and my son have received 16*l.* in the two years; but you know I do not work my full time in the pit. I am an insurance agent, and sometimes take a day for that, and I sell a few books now and then, and I take a day for that, which causes me not to have so much bonus as those that work full time.

13,151. (*Chairman.*) But notwithstanding that you had upwards of 5*l.* this last year ?—5*l.* and better the first year, and nearly 5*l.* the second. Altogether my son and I have received a good bit.

13,152. (*Mr. Booth.*) During this strike of 1863 were any attempts made to prevent the new men from coming to Messrs. Briggs' works ?—There were attempts made to prevent them from coming during the strike.

13,153. What was the nature of those attempts ?—They were threatening.

13,154. Who threatened ?—The men.

13,155. The men connected with the union ?—Yes; perhaps excited by the speeches of me and Brown and others.

13,156. Did they succeed in frightening away some of the men ?—Some they did.

13,157. (*Mr. Roebuck.*) Since you have become a shareholder, have you received any abuse for being a shareholder ?—A vast amount.

13,158. In what way ?—They told me I was a traitor. I used to advocate the cause, and advocate it well too, they said, but now they say I am a traitor, and therefore no more worthy of their confidence.

13,158*a*. Did they never use any harder word than "traitor" ?—Yes, one man said I ought to be thrown into the river, and a stone of a thousand ton weight tied to my neck.

13,159. (*Chairman.*) There are not many union men in the colliery now ?—No.

13,160. How many ?—None at Whitwood, but a few at Methley Junction, but I do not believe that half of the colliers at Methley Junction are in the union, and as I say there are none at Whitwood, where I should say more than 300 men are employed.

13,161. (*Mr. Roebuck.*) How late is it since you have had in your neighbourhood a visit from Mr. Brown ?—It is not so long since, the 2nd of March, I believe.

13,162. Did he exercise his eloquence upon that occasion the last time he was there ?—I do not know that it had reference at all to Messrs. Briggs' scheme.

13,163. Did the men ever what they call clod you ?—Yes, they did.

13,164. When was that ?—It was in November, I believe, when Ackroyd was speaking against the principle. He said that there were two black palls hanging over the interest of the district.

13,165. Not unionism ?—No, that was not a black pall.

13,166. Was it not two black palls hanging over the interests of unionism ?—Yes, and consequently over the interests of the men. He said one of them was so many thousands of dozens of coals up at Pope and Pearson's in the neighbourhood, and the next was Messrs. Briggs' scheme of co-operation which he thought no co-operation at all, but a system of cheating the men.

13,167. On that occasion did you do anything ?—When he had finished I got up to defend the principle, because it is dear to my life. I believe it is a good thing and is calculated to do good, and I have taken it up not for any amount of interest or flattery or benefit I might get from the masters by advocating it, but because I believe it is destined to do a great amount of good.

13,168. When you had the courage and honesty to tell your own mind about the matter, did they clod you because they disliked what you said ?—They did, and they would not let me continue to speak, and overpowered my voice, and I had a clod come at my head.

13,169. I hope it did not strike you ?—It did not hurt me, only my feelings were hurt.

13,170. But you are a public man, you must have had your feelings hurt very often ?—At first, when the scheme was propounded, hearing the opinion of Brown and me respecting it, I believe that Mr. Briggs had had a meeting at Methley Junction in the schoolroom, and Brown was there and I was there. Brown advocated the cause, and even shed tears on that occasion, and said that it would be the cause he believed of healing a vast amount of wounds, &c. We were very friendly, and shook hands on that point. The next time he came to Methley (that is in the neighbourhood) he told us that we had sold ourselves.

13,171. Which he had contributed to do according to your statement ?—We had sold ourselves, he said, by entering into the scheme.

13,172. Which thing he had contributed to your doing ?—In the first instance.

13,173. And so far he had induced you to sell yourselves ?—Yes.

13,174. Did he shed tears over his own lapse or yours ?—Over ours, I suppose.

13,175. (*Lord Elcho.*) Has Mr. Brown great water power, has he got tears at command ?—Middling ; he can please a few colliers.

The witness withdrew.

Adjourned to Tuesday next at 11 o'clock.

1, Park Prospect, Westminster, Tuesday, 31st March 1868.

PRESENT:

Right Hon. Sir WILLIAM ERLE.	JAMES BOOTH, Esq., C.B.
Right Hon. the EARL OF LICHFIELD.	JOHN ARTHUR ROEBUCK, Esq., M.P.
Lord ELCHO, M.P.	THOMAS HUGHES, Esq., M.P.
HERMAN MERIVALE, Esq., C.B.	FREDERIC HARRISON, Esq.

THE RIGHT HONORABLE SIR WILLIAM ERLE IN THE CHAIR.

Mr. WILLIAM KNIGHTON examined.

Mr. W. Knighton.

31 March 1868.

13,176. (*Mr. Roebuck.*) You are chief foreman of the foundries of the Staveley Coal and Iron Company, I think?—Yes.

13,177. Where did you serve before that?—I was apprenticed at Alfreton ironworks in Derbyshire.

13,178. During your apprenticeship did you join the moulders union?—Yes.

13,179. Then you went into Lancashire after that, did you not?—Yes.

13,180. Can you tell us any particular circumstance that happened to you shortly after you joined them?—Yes; the first job I had in Lancashire was pipe-making, and not knowing anything of the rules that governed the shop as far as the trade society was concerned, I went to work and made five pipes. The consequence was that in about a week I was summoned before a general meeting of the union and fined for making five pipes.

13,181. You were fined, I suppose, for making more than the society allowed?—Yes.

13,182. How many did they allow?—Four.

13,183. And how many could you really have made in a day?—If I had exerted myself perhaps seven or eight, without putting myself about much.

13,184. They fined you 1*l.*, did they not?—Yes.

13,185. And anything besides?—Yes, they said that if I persisted in it they would fine me 2*s.* 6*d.* a day.

13,186. I suppose after that you did not make more than four pipes a day?—No. In consequence of that resolution of the general meeting my employer had to suffer the loss of one pipe a day.

13,187. I think you have seldom joined strikes?—Seldom. I have generally tried to keep out of strikes. I was in one strike a long time.

13,188. Where was that?—At Stockport.

13,189. What was the cause of that?—At the time that trade was very bad and many men out of employment, our employers wished to reduce our wages 2*s.* a week (we were generally receiving 36*s.* a week; that was the general wages of the town), and as far as our shop was concerned we should have agreed to accept the reduction, but there was a general meeting in the town, and it was decided that we must leave, and of course we had to leave.

13,190. What year was that in?—I believe in 1847.

13,191. (*Mr. Harrison.*) Was it a general meeting of that trade?—Of the trade society.

13,192. (*Mr. Roebuck.*) Of the moulders?—Yes.

13,193. Were many men at that time out of work?—Very many; thousands of moulders were out of employment at the same time.

13,194. Were they out of employment in consequence of their not accepting lower wages, or were they out of employment simply because there was no work for them to do?—Trade was generally bad; there was not work in our shop for the whole of the men who had been employed there, but 18 of us could have gone on with our work at 34*s.* a week.

13,195. And you were not allowed to do so?—No.

13,196. What was the consequence of that to you?—That I was out of work for five or six months, and tramped round the country seeking work, and when I got back home I found that the very men that had protested against our accepting the reduction (trade having still continued bad the employers had been compelled to offer a further reduction) were working at 30*s.* a week.

13,197. What was the effect of that upon your mind; what did you do in consequence?—The effect was this. When I got home and found these men working in my place at 4*s.* a week less than was offered to me, I determined in my mind that for the future I would be my own master, and make my own arrangements between myself and my employers.

13,198. Did you continue to pay to the union?—I paid to the union for many years after that, in fact I paid to the union till two or three years ago.

13,199. How did you escape their control?—If I saw that there was a probability of a strike in a shop I took myself away. In several instances that was the case. But some few years after that I came to Staveley, and we have not been interfered with so much there as in some places.

13,200. And from that time you have been your own master?—Yes. If such a thing had taken place I should have said at once I cannot allow anyone to interfere between me and my employer.

13,201. Did you ever know any other man to do the same as you have done?—Some few, not many, amongst them.

13,202. When they did that were they at all threatened, or was any violence employed against them?—That was the case formerly with moulders, but for many years they have managed the society a great deal better, chiefly as a benefit society. They do not encourage strikes now at all. When I entered the society, if there was a strike in the country it was sure to be the moulders, but they have profited by experience, and they manage the society now chiefly as a benefit society. There are few things now in it to complain about.

13,203. Do you mean that the moulders at the present time do not interfere with any contract which you may make with your master?—It is rarely the case. There are some towns where they do interfere, I believe.

13,204. Have they any rules with regard to apprentices?—Yes, in what we call a club shop. They allow so many boys to so many men, and beyond that they will not allow them to remain in the shop.

13,205. Do you know any case of hardship arising from that rule?—Yes, I know one very hard case. It was the case of a boy who was the son of a man who had been a leader in the society many years. He had brought up the boy till he was about 17 years of age, intending to apprentice him, but he had never been able to get him into a shop where there was not the full number. He moved him from one shop to another. At last an opportunity occurred, in conversation with his employer. He offered to take the boy in, and he did so, and the consequence was a general meeting, and the man had to leave the society.

13,206. Can you tell us the year in which that happened?—I do not think I can.

13,207. Can you tell us where it happened?—It happened in Stockport.

13,208. And the name of the master?—The master's name was Williamson.

13,209. And the name of the man?—Rowe.

13,210. And the consequence of that was that he left the shop?—He left the society.

13,211. What was the consequence to the master?—After that first strike which I named in the same shop he never seemed to recover himself. He was obliged to take in a partner some time after that, and

Mr. W. Knighton.

31 March 1868.

ultimately he had to give up his business, and his effects were sold.

13,212. How do you connect that with the moulders?—I connect it with them in this way to begin with. They would not allow the men to work in the shop who used to work there; and the men all had to leave, and he got an inferior class of men, and he seemed to sink from that time.

13,213. Do you know anything of the subsequent history of the boy, whether he continued in his apprenticeship?—Yes, he served his apprenticeship. I have seen him since as a journeyman moulder.

13,214. With that master?—He stayed with him up to the time of his failure, when of course he would get into some other shop.

13,215. I think, since you have been at Staveley, you have not been troubled with that sort of thing?—No, we have a number of club men at Staveley, and a number of non-club men; but we have had very little interference from the society. Sometimes they have made an attempt, but we have always refused to allow them to interfere with us.

13,216. You have the management of the foundry; do you ever allow any interference with your management by a trades union?—No, never.

13,217. Have they ever tried to interfere with you?—In some individual cases.

13,218. In what way?—In this way. Sometimes a man would come and get employment in the place, and he would say to the apprentices (when an apprentice gets 18 to 20 years of age we generally expect as much from him as from a journeyman) "Now, "you are doing too much work—you are spoiling this "job, and doing this thing and the other." As soon as we found it out, of course we discharged the man instantly. If it had been strictly a club shop, we should have had to strike on that.

13,219. From your experience do you believe that the comfort of the working man would be best secured by being left to himself or being interfered with by the union?—Decidedly by being left to himself.

13,220. Then in your opinion the unions do him no good?—They do him no good further than as a benefit society. There are few workmen, and in particular few moulders who think of laying up at all from their wages, and I think that the society is an advantage to them just the same as it would be to a man to save his own earnings.

13,221. As a benefit society that is, and not as a trade society?—Not as a trade society certainly. It works against the well-being of the men in numerous ways, as I have seen in many instances in my experience at Staveley, and before that time. Take a regular club shop for instance; apprentices grow up there, and they are almost compelled from the influence of the men in the shop to join the union. The consequence is that when they are 21 years of age, they may not work under the fixed rate of wages, as the employers cannot afford to pay them the same wages as the experienced workmen, and so they have to go on tramp up and down the country seeking work, and they return home with broken constitutions and vicious habits that have an evil effect on them through life.

13,222. Now if it does no good to the working man to whom does the union do good?—I do not know that it does good to any one.

13,223. Is it not employed by certain people as a means of livelihood?—Yes, but I do not suppose that in an old trade society they employ delegates at all; the moulders do not. The moulders' was one of the first societies established, and they have passed through all the evils that the majority of the trades unions are at the present time suffering from.

13,224. Then I suppose the moulders' union is a peculiar union in not employing delegates. Do you know anything of other unions?—I have had some experience of the colliers' union.

13,225. Do they employ delegates?—Yes.

13,226. I suppose the delegates live by the union?—Yes.

13,227. So that if the union is no benefit to the working man it may be some to the hired delegate?—Yes. If you will allow me I will show the difference between our shop and a club shop. The way we work in our shop is to take the best men that understand their business, and can be depended upon for the quality of the work. We let the work to those men and they employ younger men that have not had the same experience that they have, and they pay them a fair share of the money earned, whereas under the circumstances of a club shop those young men would have to leave. We keep our men. We have scarcely a man out of 700 or 800 moulders of different sorts that we have not brought up on the place.

13,228. That I suppose introduces a more kindly feeling between you and your workmen?—Yes. I may say that we really have not had any trouble with them. If a man has any complaint to make he comes and makes it.

13,229. If the apprentice is separated from the master to whom he has served his apprenticeship, I suppose the relations between them must be different, and kindly feelings cannot have time to grow up?—No.

13,230. Do you believe that the union protects the interests of the working man against the master, supposing him to be inclined towards injuring them?—No, no further than that it provides a fund for him. If a master was to attempt the reduction of a man's wages, or an increase of his work, he knows that if he joins the union he has something at the back of him; and that they would assist him to resist that reduction.

13,231. But do you believe that he really is more protected by the union than he would be protected by the general feeling of the trade in which he was working?—Not if he was what I should call a provident man, a man that took care of what he earned.

13,232. So that the union takes care of the improvident man as well as the provident man?—Certainly.

13,233. And therefore, as far as that goes, it gives a premium to improvidence?—Yes. I do not know what benefit a man can derive from it.

13,234. In those cases in which there are not trades unions, how is the master's conduct regulated; what motive has he to behave well?—Well, I may speak for our own shop. If we have a good workman, a good intelligent man, a man that attends to his work regularly, it is our interest to keep that man. We have men in our shop at the present time that scarcely any circumstances would make us part with, men that have made themselves valuable in the shop.

13,235. So that in the long run the master's own interest would lead him to behave properly to his men?—Certainly.

13,236. (*Chairman.*) Is there no jealousy among the men, if one man has 6*s.* a day and another man 7*s.* a day. Do not you find that heartburning comes up?—No; that would be answered in this way; the man that would be at all likely to complain about that would be thoroughly unfit to take that man's position; he could not do his work.

13,237. Do not you assume that your fellow creatures are in the large majority of cases well intentioned sensible men; the line of your evidence is that, is it not?—Yes.

13,238. But there are some very difficult men to manage, that come up occasionally, I suppose?—Yes, there are.

13,239. According to my experience, if you give one man 6*s.*, and another 7*s.*, for the same work, there is a good deal of heartburning created?—Yes; but that man had better receive the 6*s.*, and allow his fellow workman to receive 7*s.*, than leave his employment and be flung out of work and distress follow.

13,240. (*Mr. Roebuck.*) Have you considered the question of piece work?—Yes, we work piece work.

13,241. Do you prefer having men working on piece work to day labour?—Yes; if I were a workman again to-morrow, I would prefer working piece work.

13,242. Do you suppose that piece work favours the good workman?—Yes, it favours the industrious man.

13,243. And gives him a motive to be industrious, I suppose?—Yes.

13,244. What is the effect of trades unions and their regulations; do they conduce to piece work or to day work?—To day work decidedly; in many towns they will not allow the men to work at piece work at all.

13,245. And has that an influence in favouring the bad workman?—Yes, in a regular club shop if a man does not half understand his business, still he has the same chance as a good man. There is nothing to encourage a man to be intelligent and industrious and attentive to his work, if his fellow workman, who spends half his time in idleness and drunkenness, can come and get the same wages as he can.

13,246. So that upon the whole you believe that the influence of the trades unions is to favour day labour in preference to piece work, and that that has a mischievous effect upon the morals and intelligence of the workman?—Yes.

13,247. Have you seen a good deal of suffering among the working classes caused by their system of endeavouring to bring every man down to one level?—Yes.

13,248. Will you give us an instance of that?—I have seen numerous instances of that sort. Here is a young man coming out of his apprenticeship. He cannot compete with a man that has worked 20 or 30 years at his trade, and consequently the employer says, "I cannot employ you, because the society compels me to pay you the same," and he goes from town to town, and from one place to another, and comes home because he cannot get work, whereas, if he were left to himself, and to things as they ought to be, his employer would pay him perhaps 30*s.* a week, and keep him in the shop, but he is not allowed to work in the shop.

13,249. You in your present position at Staveley are enabled to select your men, I suppose, without being interfered with?—Yes, they do not interfere with us at all.

13,250. When you want a man you select the most intelligent man and the best-behaved man, and the most industrious man?—Yes.

13,251. Do you suppose that you have as good a class of workmen as they have in other works?—Yes, we have a class of workmen second to none.

13,252. You do not permit interference?—No; if a man attempts to interfere with us we tell him if he is not satisfied to leave the place.

13,253. In your experience of life as a workman have you found on the part of many large bodies of working men a disposition to resist the trades unions, and a wish to get rid of their influence?—If I have found one man more intelligent than another he has generally objected to any interference from them; in fact all good men I have come in contact with have been loud in their complaints against any interference wishing to be left alone to manage their own affairs.

13,254. Have you had experience of persons coming from distant towns and interfering with another town and the working men there?—No, I have seen very little of that, because, as I said before, the moulders never practised that. I have known plenty of strikes in the early part of my life where the shops have always been picketed against any men coming from another town; every road into the town has been picketed, and a man has been stationed with money at the end of every street to send them back again.

13,255. Have you any experience or knowledge of the doings of the London Working Men's Association; I mean that which is presided over by Mr. Potter?—Very little; I have seen a little in the papers.

13,256. You know nothing of it but what you have seen in the papers?—No.

13,257. (*Mr. Harrison.*) It never interfered with you?—No.

13,258. (*Mr. Roebuck.*) What has been the sort of feeling at Staveley between the men and the masters there since they have resolved to have nothing whatever to do with trades unions?—Well, there is a very good feeling existing between the workmen and the employers.

13,259. How is that manifested?—If the men have any complaint to make—for instance at the present time in our shops—they would come to me, and if it were in my power to redress the grievance I should do so at once; and if it did not come within my limits I should take it to the managing director, and he would see the men (he has done so frequently), and the thing would be settled comfortably.

13,260. The men have perfectly free access to you or to the directors if they please?—Yes.

13,261. If the men wish to see the directors you do not say to them, "It must go through me?"—Certainly not; any man on the place can go and see the managing director at once.

13,262. Have you ever known any desire on the part of the managing director not to listen to them or talk with them?—Never; he is very willing to listen to them.

13,263. Have you any knowledge of the influence of your plan of management upon similar establishments round and about you?—Yes, the consequence has been this: we have been regularly employed at Staveley for very many years. I do not think up to this year that a man has had to be idle one week at Staveley for a long time.

13,264. But in the neighbouring establishments of the same description have they been idle at times?—Yes, there have been strikes all up and down the neighbourhood.

13,265. And those strikes have conduced to idleness and to misery, I suppose?—Yes, certainly as strikes ever do.

13,266. Of that idleness and that misery you know nothing in your establishment?—Nothing whatever.

13,267. (*Chairman.*) What are the ordinary moulders' wages—men of ordinary skill?—A moulder of ordinary skill we should pay 28*s.* a week, at day work, and if that man were working piece work he would perhaps get 35*s.* or 2*l.* a week sometimes.

13,268. (*Mr. Roebuck.*) You say "day work," then you do employ some people by the day?—Yes, there are some few men that you could not prevail upon to take piece work, and very often they are working for others that do take piece work.

13,269. (*Mr. Harrison.*) What are at present the recognized union rates for day work in your district?—There is one union shop in Chesterfield, and they pay all the men 28*s.* a week.

13,270. (*Mr. Roebuck.*) Good, bad, and indifferent?—Good, bad, and indifferent; they are compelled to do so.

13,271. (*Mr. Booth.*) You have had some experience formerly of strikes?—Yes.

13,272. Did you ever know any instance in which they answered in a pecuniary point of view?—Never. I never knew a strike do any good in the world—not even to the union men themselves, for while the men are out the employer gets a few non-clubmen in the shop, and there are always a number of apprentices, and in many instances, after the strikes have lasted a few weeks, the men have come back to him. I do not know that I ever knew a strike to accomplish what the men left the place for.

13,273. On the whole, even if it did succeed, it cost more than it was worth?—Always.

13,274. (*Mr. Roebuck.*) I suppose it cost a good deal of money, and more in misery?—Yes. I think nothing of the money in comparison with the misery.

13,275. (*Mr. Booth.*) I collect your opinion to be that in regard to unions they are advantageous only to inferior workmen?—Yes.

13,276. And they are the greater part, I suppose?—Yes; but it must be remembered that if we were short of work in our works all the unions in the world could not find it for us.

Mr. W Knighton.

31 March 1868.

13,277. You think it better that the masters should be allowed to pay men as much as they are worth, and not be compelled to give them more?—Yes, I think it right that men should have free liberty to make their own contracts with their employers.

13,278. (*Mr. Harrison.*) You said that at first you had a difficulty with the union because you made five instead of four pipes in the course of the day?—Yes.

13,279. What number, for instance, of the same thing working under the same conditions do your men make now; how many as manager would you expect them to turn out?—With our present mechanical facilities we should make at Staveley at the present time seven a day.

13,280. (*Mr. Roebuck.*) Would that be by men who would do day work or piece work?—Piece work.

13,281. (*Mr. Harrison.*) Would the union men working for you turn out seven?—That is one of those jobs that we always work piece work, and union men if they came to us would take our price.

13,282. And would they turn out seven pipes a day?—Yes.

13,283. Then there is no rule of the union that a man should be limited to four, or five, or any other number?—In some towns; but not with us.

13,284. Where is there such a rule?—In Manchester. I do not think they would allow a man to make five now, and I do not think that they would in Bury.

13,285. You mean to say that whilst you are moulding seven pipes a day, a firm working in Manchester or Bury would be only able to turn out four per man?—Yes.

13,286. Do you suppose they can compete with you upon those terms?—No, I suppose they cannot; the consequence is that we are always employed.

13,287. The wages which you pay your men I suppose vary with each man very much, do they not?—Yes; sometimes we should have a class of work that we could not very well set piece work, a lot of jobbing work. Then we should still have to depend upon one man out of every seven or eight perhaps for the safety of that work, and that man we might pay 30*s.* or 32*s.* a week.

13,288. And what the others?—28*s.* a week.

13,289. Would it be the same rate as is paid in the district?—Yes. On the whole we pay better wages than they do anywhere else in the district.

13,290. As a rule, do not you consider that a skilful and industrious man, who has served his full time as an apprentice, after he has completed that time is a competent workman if he is very likely to become one?—Well I find as a rule that they are not.

13,291. And that they become so afterwards?—In some cases moulding seems to be an exceptional case. A moulder's work is to some extent like a lottery; you never know whether it is safe till you see the casting. If you were to trust a man or a number of men with a piece of work that perhaps takes a month to prepare for casting and then there is a failure, the consequence would be serious. That could not be in joiner's or builder's work, because there as the thing goes on, you see at once whether the work is right or not.

13,292. What inference do you draw from hat?—I draw this inference, that the superior workman whom you depend upon for that work ought to reap the benefit of his skill.

13,293. (*Mr. Booth.*) You find that men acquire greater skill by experience?—Yes.

13,294. And that they become therefore worth more as workmen?—Yes, but there is a difference between men. I have seen some better at 21 than others at 30.

13,295. The ordinary class of men with increased experience acquire greater skill?—Yes.

13,296. (*Mr. Harrison.*) You have spoken of a class of men who entered as apprentices, and have in consequence of the union rules had to wander about the country?—Yes.

13,297. Are not those the class of men who never do become efficient workmen?—In some cases it may be. I left my shop through the union and was out of work six months, and tramped all up and down the country. When I got home I determined that I would not allow them to interfere with me again.

13,298. But when you went about the country, it was not because you were not fit to receive the full wages?—No.

13,299. I am speaking of these men, who at the end of the time of their apprenticeship leave their employment because they are not worth the full wages; those are the class of inefficient men who never will be worth the full wages, are they not?—I would not say that. There are very few men at 21 that can work anything like with a man who is receiving 36*s.* week, and has had long experience.

13,300. (*Mr. Booth.*) The union in this case assume that he is a competent man, and require that he shall not take less than the wages of a competent man?—Yes, he would be proposed and seconded, and admitted into the society as competent to get his living at the trade, and so he might be in some place where inferior work was done; but if he had to go into a shop and take the chances of any job that is given to him, he is positively useless in the shop. We have had lots of men come to our shop when we have been busy, and plenty of lads 16 years of age could do the work better, but all admitted to be in the union and earning their living at the trade.

13,301. (*Mr. Harrison.*) But without comparing the man who has just passed his apprenticeship at 21 with a particularly skilful man who has had long experience, and therefore would be above the average, as a rule, is not a man who has passed through his full term of apprenticeship necessarily a competent man; is he not up to the average?—No, not as a moulder.

13,302. What term would you say from your experience is necessary to make a moulder?—Long experience. With our system of working a young man would not be flung into the streets. We should put him with a first-class man, and ultimately he would gain his experience and be a good workman.

13,303. If that is your practice it follows from that that you must be paying the men of 21 and upwards (from 21 say to 25 or 30) lower wages than they receive where they are working on the terms of the union?—I do not understand that.

13,304. You say that you could not afford to pay them the same wages as you could pay a thoroughly competent man?—No. The way we should do it would be that if a young man were out of his apprenticeship he would come to me and say he was out of his time. I say, "I will see what can be done for you." In all probability I should select a certain party for him to work with. He would start, perhaps, at 26*s.* a week, and that man would have instructions to pay him the 26*s.* In the course of 12 months we should say to this man, if he still worked with him, "This young man has improved himself, and you must give him 28*s.* a week."

13,305. (*Chairman.*) You let work to a man, and then you nominate to that man the wages he is to give to the person he employs?—We say to him, "You can "have so-and-so to work with you, and you must pay "him so much a week." In all probability (and I have no doubt in the majority of cases) it would be to the interest of the man that takes the piece work to give him even more than we say, but we put a limit that he cannot give him less than that. If they go on and are successful on a job in many cases I have known them pay their assistants 30*s.* and 35*s.* a week, although we have only said, "You must not pay them less than 28*s.* a week."

13,306. (*Mr. Harrison.*) Then you said just now that you did not believe that the union was of any advantage to the provident man. You mean, I suppose, by "the provident man" a man who had accumulated savings out of his earnings and was possessed of some small capital?—My meaning was simply this: if a man is in the habit of saving his

earnings, and his employer makes any attempt to reduce his wages, or otherwise to do any injustice to him, he knows then he is in a position to defend himself. If he has got a few pounds in the savings bank he can say at once to his employer, "It is wrong for you to do this, and I will not work for you."

13,307. The trades union is a mode of making such collective savings, is it not?—Yes, and in my opinion it acts very injuriously to the men. Men that under other circumstances would see the necessity of saving their earnings trust to the union, and say to themselves, "If I get out of work I have so much from the "union, and there is no necessity for me to save my "money," and they go on from bad to worse till you find a many of them the most degraded class of men in the country, and in my opinion the great cause is their connexion with the union to commence with, because they trust to it, and I have no doubt that there are plenty of moulders in this country that have not from about 21 to 40 years of age worked half their time.

13,308. Then where a man has no accumulated savings of his own, no capital invested, and where he has no union to fall back upon, you think that he will be unable to hold his ground in a question that arises between him and his employer as to the hours of work or the rate he is to work at?—I should say that in that case, if that man has no connexion with the union, he is at liberty to go and get work at any shop, but if he is in the union he can only go to this shop or that, just where they allow him to go, and his chances even in that case would be preferable to the man with 9*s*. or 10*s*. a week at his back.

13,309. There was a dispute some time ago at Staveley, before the new principle was adopted, a strike as we have heard already?—Yes.

13,310. There was some attempt amongst the men to get up a union?—Yes.

13,311. Do you know from personal communication with them what were the grounds upon which the colliers proposed to form a union?—I have little to do with the colliers, but Mr. Campbell, who is here, will answer that question perhaps. But I may state that had no delegates come from other parts our men would never have thought of forming a union. We have many on the works that have had to do with one union, and I do not think they would have had to do with a second.

13,312. Do you know whether it is the fact that they were contemplating a union, and sent for Mr. Brown or some other delegate?—No, I cannot speak to that.

13,313. You cannot speak as to that association then, the Free Labour Movement?—No.

13,314. Have you nothing to do with the management of the Staveley Hill Free Labour Association?—Well, as far as that goes it is connected with the whole of the place.

13,315. I am speaking of the association which is called the Staveley Hill Association? — You are speaking perhaps of our accident fund, we are connected with that just as the colliers are.

13,316. (*Mr. Roebuck.*) I think the statement was that that association disappeared?—Certainly, it disappeared with the delegates.

13,317. (*Mr. Harrison.*) The accident fund is an association which has a special set of rules and a committee of its own, has it not?—Yes.

13,318. And one of those rules is that no member of it shall belong to a trades union?—Yes, that is one of the rules, but I have already stated that we had some few union men on the place, men that had been on the place some years, and as the company did not wish to interfere with them, Mr. Markham said at the commencement that if any of these men demurred about it he would sign an agreement that they should receive the full benefits of the accident fund in case of accident, and that satisfied the men.

13,319. (*Chairman.*) You say that the effect of the union is to cause a habit on the part of a man of trusting to the union instead of his own resources?—Yes, that is my own experience of its effects.

13,320. Perhaps you have looked at the course in life of men who have self reliance as compared with men who look about for help in every difficulty?—Yes, my experience of men is this, that where a man has the ability and self respect to get on in the world he does so independently of the union, and it is only an inferior class of men that relies on the union. I know personally lots of men that would as soon think of anything as of saving a penny, simply because the union will do this and that for them, and in my opinion it has acted against the welfare of numbers of workmen in that respect by leading them to think that they may rely on the union; men get into the habit of going to a public house to their club, and the more they go the more they like to go, and they pay to the club at a time when they have not sufficient money to buy bread for the family, simply because it is if they lose a situation through idleness, or no matter how they lose the situation, there is an allowance for them.

13,321. I am speaking now of the qualities of mind of the men who are independent of external circumstances. You think that the habit of relying upon the union instead of self reliance takes away the spring of the men's character?—Yes. I do indeed. I believe that moulders as a class would have been a more intelligent class of men if it had not been for the interference of the union in the regulation of their employment.

13,322. (*Mr. Booth.*) The men of whom you are speaking are naturally improvident, and the union encourages the habit, you think?—Yes. If you will allow me to go back to my early history in the society, at that time a man could not receive any benefit from the society unless he tramped for it; we had a penny a mile all the way we went; we had to put up every night at some low public house, and go into the tap-room, and the consequence upon the morals of the men was fearful. Some years afterwards we got rid of that. A man is not compelled to tramp now, but numbers of them do go about.

13,823. (*Mr. Harrison.*) This tramping is merely going in search of employment—do you not think that a good thing?—No, not going in search of employment in that way—every night in every club house. I should say we had from 20 to 30 men out of work. Trade was bad, and it was no good asking for work.

13,324. You think it not a good thing for men to go about the country in times of slackness?—Certainly not. I think the system that has been established since is a better one. The trade furnishes now a monthly report, and if a man was to fall out of work he would refer to the report and find out where trade was good. At that time we could go to one box every six months, and I have known men who as soon as ever they were free and could get to the same box again would be off.

13,325. That then is an improvement that has been introduced in the union?—Since that time.

13,326. And the thing itself is a very great advantage, which the members of the union enjoy over non-members?—I think not. I think that the good effects are overbalanced by the evil on the minds and characters of the men.

13,327. I ask you first, if it is not a great advantage which members of the union enjoy over non-members, that they know where trade is good?—If a man has any intelligence at all he can see that from the public papers without any reference to the reports.

13,328. Do you tell us that a moulder can learn from the public papers every week in what particular shops throughout the country he is likely to find employment?—No, I do not say anything of the sort. I say that if a man has any intelligence he can see where there is a probability of employment.

13,329. Does not the union report you have just spoken of, as superseding the men's necessity for tramping about the country, give a very much increased facility for taking labour to the spot where it is wanted?—Yes, I have already said that that is an

Mr. W. Knighton.

31 March 1868.

improvement upon the old system of tramping for it, and knowing nothing about it.

13,330. By what means can a man, not a member of the union, avoid tramping about the country in search of work when work is slack?—He has this advantage over a man that is in the union. There are only such and such shops in the majority of the towns in this country where union men can go. In some cases the club will not allow them to go in, and in other cases the masters will not have them.

13,331. What is the proportion of shops in the country in which union men are excluded?—I can scarcely answer that question correctly; I should say that the thing is about evenly balanced.

13,332. I am speaking of union men being excluded?—I have not had much to do with the society lately, and cannot answer the question.

13,333. (*Mr. Booth.*) I suppose they vary in different localities round the country?—Yes.

13,334. (*Mr. Harrison.*) What is about the proportion?—I am not a union man, and cannot answer the question.

13,335. But I understand your argument to depend on making out that it is a considerable proportion where they are excluded?—I have no doubt a considerable number of shops would not have a man who was in the union. I should say there are as many more out of the union as there are in.

13,336. The system of tramping in search of work when work is slack you speak of as a very great evil to men who are obliged to adopt it, and you tell us that the union enables men to dispense with that by furnishing them with constant reports from different parts of the country by means of their organization?—Yes.

13,337. I ask what means has the non-union man of obtaining that information unless by tramping up and down the country which you have just told us is the ruin of so many men?—From the general reports of trade any man will know where trade is good. I, for instance, can form a pretty good idea where a man would be likely to get employment and where not. I think at the present time it would be scarcely worth his while to go anywhere; all the advantages that a man has now from the union he gets from the benefit societies, from the Odd Fellows lodge, for instance.

13,338. Do the Odd Fellows lodge give him constant reports of the state of trade in the different shops throughout England?—Not that I am aware of.

13,339. Then he has another advantage, has he not, which is not given him by the Odd Fellows?—I do not see it.

13,340. I thought you said that all the advantages which the man out of work has from the union he has from the Odd Fellows. I put it to you that the constant report from all parts of England as to the state of trade is an advantage which the union gives him and the Odd Fellows do not?—But it is such an advantage as he can get without the union.

13,341. That is what I want to come at; where does he get it?—There is generally an idea where there will be trade. For instance, supposing a man leaves our shop, if there is a good order for work gone anywhere it is soon known up and down the country. Supposing they had a good order in Sheffield, our men would know it the next day; they would not have to wait for the monthly report from the union to know it.

13,342. You have just now told us that one great improvement made in the modern system of working the union over the old was that the way in which the information from various parts of the country was supplied to the members dispensed with the necessity of tramping about in search of work?—Yes.

13,343. (*Lord Elcho.*) Are you aware whether any society has been established in London for the purpose of keeping a record where work is to be had, and of different kinds of work, and for enrolling the names of men of different trades who are in search of work?—Yes, I have heard of that.

13,344. Do you believe that such a thing as that would be desirable disconnected with any union?—Yes, it would be more advantageous to some trades than it would be to moulders, because moulders generally get to know through one source or another.

13,345. (*Mr. Harrison.*) But are you aware that one of the conditions of employment under that system of registration is that the men applying will have nothing to do with any union?—I have heard that much, from accounts I have seen at different times, but I know little about it.

13,346. (*Mr. Hughes.*) When you say that the Odd Fellows lodges give the same conveniences and the same assistance as the unions surely the Odd Fellows lodges (at least those which I am acquainted with, and I am a member of one), do not give allowances to men out of work?—Yes, if they tramp they do.

13,347. What lodge are you alluding to?—Take the Manchester Order of Odd Fellows, for instance. I am a member myself.

13,348. So am I, if you mean the Manchester unity?—Yes. If I were to go in search of employment they would provide me with a card.

13,349. Yes, but they do not give you an allowance on the ground of your being out of work, at least it is new to me if they do?—I think I shall be safe in saying that they do. Not positively for being out of work. Suppose I take a card from London and go to Northampton, there they provide me with a bed and other things to the amount of which I cannot speak. We have had numbers of workmen come to Staveley with Odd Fellows cards.

13,350. (*Chairman.*) You would much sooner have a man trust to his own search for knowledge and trust to his own self-reliance than have a man leaning upon a delegate or secretary to fix his place in life?—That is the substance of what I wish to say.

13,351. (*Mr. Harrison.*) This Odd Fellows Association of which you are a member, by supplying the means of tramping about the country to this day practises, as I understand you, what you have spoken of as one of the worst features of the union under the old system, and a feature which the union has done away with?—I do not say anything of the kind.

13,352. How do you explain it?—I say this, that the benefit given to a trades unionist now for tramping is so small that there is no necessity for them to have it. If they want to depend upon the society at all, the Odd Fellows will provide them with a bed wherever they go, and what other benefits I cannot speak to; but they do not profess to help a men to leave his work or to support him when out of work.

13,353. I understood you to say that the union used to support men on tramp, and a very bad system it was?—Yes.

13,354. And that they have now been able to supersede that by supplying information through the correspondence of a secretary. You now say that the Odd Fellows enable men also to go about the country while in search of work and pay them?—No; I said I did not thoroughly understand what benefits they did allow them; but I know that they provide them with a bed and certain other advantages.

13,355. (*Chairman.*) They do not ask you in the Odd Fellows why you are travelling?—No.

13,356. (*Mr. Harrison.*) You have just brought it as one of the charges against the old union that it enabled men to tramp about the country in search of work?—Yes.

13,357. And you seem to me first to speak of the assistance which is given to men tramping about the country in search of work when it is given by a union as a very bad thing indeed, and as the ruin of many men; and when it is given by the Odd Fellows, of which you are a member, you speak of it as a good thing—which do you mean?—I have not said that it is a good thing and I do not say that it is a good thing now, and I do not say that is a bad thing. If a man is really compelled to move from one town to another there can be nothing wrong in his having from any benefit society a bed.

13,358. Then you do not bring that as a charge against the union?—I say that in the earlier part of the union they encouraged the tramping system.

13,359. By helping men to tramp about the country in search of work?—Yes.

13,360. I also understood you to say that it is totally unnecessary for men to tramp about the country in search of work?—If there is no work in London and a man hears that there is work in Northampton he will go there.

13,361. But to go round the country to look for work you think is unnecessary?—I think so.

13,362. (*Earl of Lichfield.*) Do I rightly understand you to say that the union give the men weekly pay while they are tramping as you call it?—Yes, the majority of unions now pay a man so much a week whether he stays at home or goes on tramp; but if he goes on tramp he has the addition of a bed.

13,363. That is to say he receives from the union so much a day while tramping?—Yes.

Mr. W. Knighton.

31 March 1868.

13,364. Is that the case in the Odd Fellows or the Foresters?—No, I have reason to believe that the Odd Fellows provide a bed and what other benefits I cannot say.

13,365. I want to know whether that is the distinction that you wish to draw between the two, that the union pay the men so much per day while they are on tramp, and the Odd Fellows merely assist them with a bed or so, but do not pay them?—It is tantamount to that.

13,366. (*Chairman.*) The man receiving an allowance from the union may stay at home or walk round the kingdom?—Yes.

13,367. (*Earl of Lichfield.*) As far as you know he does not receive that pay from the Odd Fellows or Foresters?—No.

The witness withdrew.

Mr. James Campbell examined.

Mr. J. Campbell.

13,368. (*Chairman.*) I think you are viewer of the Staveley Coal and Iron Company?—Yes.

13,369. Were you formerly a working man; that is to say, hired by the day?—Yes.

13,370. What is your idea of a working man, one hired by the day?—Yes.

13,371. For any work that his employer wishes to put him to?—Yes.

13,372. Were you at any time a millwright on the Liverpool and Manchester Railway?—Yes.

13,373. What would be a millwright's actual work on a railway?—I was brought up by my father as a millwright and general carpenter.

13,374. And then you came as a millwright and carpenter to do so much of that kind of work as the railway company wanted, I suppose?—When a young man I went to look for work at a building establishment, and got work. But the first day after I got work (I had come from the country and did not know much about town), in the afternoon, I was asked to belong to the society. I said, "I do not know what society." They said, "We have a society here, "and if you do not join us we will not work with "you." I said, "Indeed, I will ask Mr. Brown." I went to him and asked him, "Am I to belong to some society before I can work here?" He said, "Yes, I "am afraid you must, as I believe my men will strike "if you do not."

13,375. Who was Mr. Brown?—A builder.

13,376. Where was that?—In Belfast. I wished to improve myself as a builder; I had not had much experience in building. I had been brought up to millwright and general work, and I wished to improve myself by working on large buildings that were going on. I did not like to leave the work, having got on the work and only worked one day. I asked what the consequence would be of joining. They said, "Well, one thing is that you must have the same "wages as any man in the works; you must have "3*s.* 6*d.* a day regular wages." I said, "I am not "worth it; I came here to improve myself." They said, "Well, you must go back again if you are not "worth it, or you must get into the society to-night." I said, "How do I join it?" They said, "You must "pay a guinea and subscribe" (I forget how much) "monthly or fortnightly, and you must have the full "wages, or else we will not allow you to work." I said, "Well, I will keep work as long as I can, and I "will not work under wages," and I did join it. That was in the latter end of 1825, I think.

13,377. Was that an Irish union?—It was one belonging to the town generally, I think. They were not called unions then, but societies.

13,378. (*Lord Elcho.*) They made no objection to your joining when you said that you were not worth their minimum wage?—No; they said I must join or I must leave the work.

13,379. And after having said that you were not worth the minimum wage, you were admitted to the union then and there?—Yes; they said that was my look out.

13,380. (*Mr. Roebuck.*) What occurred after; will you go on with your story?—I worked as hard as I could to gain experience. A very short time after that there was a strike at the shop, and the men were told, "You must stop working to-morrow." I was told among the rest. I asked what for, but they did not tell me what for. Of course I did not go to work; I went out with the rest. We walked about a few days, and a deputation, I believe (I had nothing to do with it), waited upon the employer, and I think he had to give way. I believe that it was owing to some men working under wages that he had employed on an outside job. I believe he had to turn those men off, and promise not to employ them again; and we went to work after being a few days out. I think that I received at the rate of 8*s.* a week for the time that I was off with those men.

13,381. Did you receive the same amount as the other workmen?—Yes; I had the same wages, and I had the same amount, I believe.

13,382. (*Chairman.*) You say that you received notice that you were to go out; had you any idea that you would go out because your employer employed some outside men?—I knew nothing about that.

13,383. Somebody settled that for you?—Yes.

13,384. Had you more strikes of this description?—From the latter end of 1825 to July 1827, I think we had three more strikes, and I was never consulted in any of them.

13,385. Had you any interest in the matter about which they struck?—I remonstrated against it every time, for I did not know any cause for it.

13,386. You had no money interest that you knew of to cause you to strike?—No.

13,387. Nor any feeling that you know of?—I had the feeling that I did not like to stop out of work.

13,388. A feeling against striking, but no feeling that impelled you to it?—No. In the latter end of July 1827, we had a more than ordinary strike, and I was employed then as foreman to a number of men. I was employed for a blind man, the Mr. Mitchell, who got the patent for the patent screw. He was a very suspicious man, and he thought that I, being a young man, would look after the cutting up of all the timber. There was a good deal of damage done in the buildings where I was (there were five or six buildings). It was understood that there were some non-union men working in the place, and all the tools were broken or destroyed.

13,389. (*Mr. Roebuck.*) Were the tools of the union men broken or destroyed?—No, of the non-union men. I was very much put about about it. I knew nothing about it. I remonstrated with the union men. I did not know it, but I said I was afraid that somebody had set them on, and they said, Well, that was nothing to me. I wanted to clear myself with Mr. Mitchell. "Well," I said to him, "I

Mr. J. Campbell.

31 March 1868.

"belong to this carpenters' society, and I should wish "to clear myself. You may think, as I belong to it, I "know something of this, but I know nothing about "it." I said, "How can I clear myself to your satis- "faction?" He brought to me a little Testament and said, "If you will say so upon that Testament I will believe you, though I cannot administer an oath." I was glad of the opportunity, and I said, "Well, Mr. "Mitchell and all you men, I know nothing about this "thing. I have no suspicion of it. I can tell you "nothing about the stealing of these tools." Then I said, "Is there any union man in this place that wishes "to clear himself about it? I hope you will all follow my "example." A few of the men did lift up the Testament and followed me, and a few did not. However, that led to a good deal of mischief, and all the union men were ordered out to leave the work. I was ordered among the rest, and being a foreman they took me before a magistrate, with two or three men, and asked me what I left my work for. They said, "You left without notice," and I said, "Yes." "Are you willing to go back again?" I said, "Yes, if you will pay my money I am willing to go back" (he owed me a little wages). He said, "Very well, go to your work," and the next day I left and went to Liverpool. I went to the union place that night and said, "Now you led "me into this thing. I remonstrated with you men "against this injustice of getting these tools stolen." I said, "I believe you did do it. I will not be a party "to it as long as I live. If you will give me anything "I will go, and if you do not I will go." I believe they gave me a pound, and I left them and was never in the union since.

13,390. (*Chairman.*) And then you went to Liverpool?—Yes, I went to Liverpool and looked about there for work, my own building work again, but could not get any, and I went on to the Liverpool and Manchester Railway, and I saw some work there which I thought I could do; some waggons building. I could not see the proper man to set me on, and I looked about a good deal and at last I fell in with old George Stephenson.

13,391. (*Mr. Roebuck.*) This is the great Stephenson you are speaking of?—Yes. I asked him for work, and he said, "What sort of work?" I said I had been up to Edge Hill and seen some waggons, and I could make them. He said, "Have you ever been used to making waggons?" and I said, "No." He said, "You are too young." I said that I would try if he would let me. "I will give you some railway work," he said, "to lay plates." I said, "I will try it, whatever it is;" and I got work as a labourer to assist in the laying down of the rail, and I went to the Sankey Viaduct with a note from Mr. Stephenson to some one there to set me on to work with the platelayers, and I told the man (I had my tools with me) that I had a note for that work, but I would rather try something else. I could do something better. He said, "Could you make a piling engine?" I said, "Yes, if you give me a drawing of it." And I worked on the railway at a piling-engine, and continued on the railway. After that I did not do any labouring work.

13,392. (*Chairman.*) He thought that there was something in your look and voice enough to make him trust you with some better work?—Yes.

13,393. And that prospered?—Yes.

13,394. And you stopped with him?—I stopped with him till his death; but in 1832 he bought an estate in Leicestershire, the Snibstone colliery, and as he found that I had been used to machinery and understood mechanics, he sent me there to take the management of sinking the pits. That was my first connexion with collieries.

13,395. It was George Stephenson who sent you there?—Yes.

13,396. What was your age then?—About 26 I should think.

13,397. Then you had the management of the mechanical department of those collieries?—Yes, I then had my experience in opening out collieries and sinking under other people. For eight years I continued there, and then I went to Clay Cross, when he commenced Clay Cross, to do the same there again.

13,398. How long were you there?—I was eight years there.

13,399. During the time that you had the management of those collieries, had you any trouble or did you see any trouble from strikes going on? There were no strikes against your part of the work I suppose?—There were strikes connected with the Clay Cross colliery in 1844.

13,400. Did you know what the men struck for?—There were some delegates came round I remember (we heard nothing at all about it), and they called a meeting I think.

13,401. Delegates from where?—From Staffordshire the first delegates came. There had been a disturbance in Staffordshire at that time. We had heard by the papers that there was a disturbance and strikes there, and the Clay Cross people were sending some coals to Birmingham, and I believe that that induced a delegate or two to come from there.

13,402. Then did those delegates hold a meeting?—They called a meeting I think; they detached two or three people for it and sent round and called a meeting and addressed the people.

13,403. What was the result of that meeting?—In two or three days they all left off work without any notice.

13,404. How many men were there in the Clay Cross colliery at that time?—At that time perhaps 300 or 400.

13,405. They all left?—They stopped the work.

13,406. How long did that strike last?—It extended then over the neighbouring collieries round, and I think at Clay Cross it only lasted about three or four weeks, when they came in again.

13,407. It was a strike against sending coal to Birmingham when the Staffordshire miners had struck?—That was one of the arguments that the delegates made use of.

13,408. Did you know any other reason why the colliers left Stephenson's colliery?—No other reason. They were much longer out in the district all round, but they were only out about three or four weeks in Clay Cross.

13,409. That of course was a loss of wages?—Yes, of course it was.

13,410. And caused the sufferings of misery?—Yes, to a certain extent. It did not continue very long, but to a certain extent it was.

13,411. And the district was all up in strike, was it?—Just round about; but it was a great deal onger I think in general. The Lings and Wingerworth collieries were out, but I think they were longer out; and the Staveley men were out at that time; that I heard by report.

13,412. (*Mr. Roebuck.*) What induced them to come back?—Because they had no reason to go away. They met the manager and talked the thing over, and first one man said he would go to work and then another, and so they ultimately came back.

13,413. They came back under the circumstances under which they went out then?—Under the same circumstances; they had no advance whatever.

13,414. (*Chairman.*) There was a loss of wages for the time, and misery suffered for the time; had you any means of observing the misery suffered by their families or themselves?—Only from general complaint.

13,415. You did not live among the men yourself?—Yes, I lived among them.

13,416. Then you heard the complaints?—The general complaint; murmurs against the delegates for coming to stir them up for nothing. They complained bitterly afterwards.

13,417. (*Mr. Roebuck.*) Did you ever hear the wives complain?—Very much.

13,418. Did they complain that they suffered much, that they had no food for themselves or their children?

—I do not think of any special case, except the general murmuring against them.

13,419. (*Chairman.*) Do you know what the men were earning when the colliery was at work, and what the allowance on strike was?—There was an allowance promised, but the men said afterwards (I had no means of knowing what they did get) that they got very little. It was said in the speeches out of doors that they would have I do not know how much if they stopped out.

13,420. Did that have any effect upon the trade of the Clay Cross colliery?—Yes, for a time it did. After the men came back again they were short of work for a considerable time. In fact it was not a very good trade at the time.

13,421. They were short of work so far as you understood it because the supply had been stopped for a time, and then the demand had gone elsewhere?—Yes.

13,422. That was at Clay Cross. After that were you in the employ of Sir Joseph Paxton, and did you go to his collieries, near Coventry?—Yes.

13,423. At what time was that?—I went there about 1858, I think; I was eight years at Clay Cross, and I left there and went with Mr. Stephenson to take the construction of the Matlock and Buxton railway, and then I got permission to take the management of some collieries for Sir Joseph Paxton as consulting viewer of the collieries and to set them out and give them plans for them; that was the Wyken colliery near Coventry.

13,424. You had information of how the veins of coal were, and you had to lay out the working?—Yes, I saw the old collieries to their rise, and then I had to infer from that where the best place would be to sink the new pits.

13,425. Was it deep work at Clay Cross?—About 200 yards the deepest.

13,426. My question was pointed to this, whether the stopping of the work was a serious damage to the colliery?—It is always a serious damage to a colliery, the road gets damaged.

13,427. Did they keep the colliery from being drowned?—They could pump; the men did not attempt that.

13,428. Then you laid out Sir Joseph Paxton's colliery, near Coventry?—Yes.

13,429. During the time that that colliery was at work, was there any strike amongst the men when you were there?—Yes, there was a strike in 1859.

13,430. From what did it arise?—It did not commence at this Wyken colliery but in a neighbouring colliery, the Hawkesbury colliery, I think. A meeting among the men was held, and some delegates came and stirred them up a little bit we understood, and the men found fault and made a number of grievances, and they gave a fortnight's notice to leave the work, and they did leave it. But during the time that they were having these meetings there were a great many meetings about. They came to our colliery and there were meetings round and near our colliery asking for help, and they would tell them what they would do; as soon as they had beaten Hawkesbury they would come to the Wyken colliery and the neighbouring collieries round. I had a good deal to do with the management of the colliery, and we did not choose to stop till they would turn us out, so we gave them a fortnight's notice.

13,431. That is the same thing as we call a lock-out?—Yes, we did not see any call that they had to join in this outcry, and they did not make complaints of anything. So when we gave them notice they made a complaint about the beer; they said that we had stopped the beer off them. That was all the complaint they made. It had been the habit at one time to have beer at that colliery, but when we opened the colliery we thought it was a bad thing for men and boys, boys particularly, to drink so much beer in the pit, and I asked the manager to give the men the option of taking the value of the beer in money. I said that we would add 3*d.* a day to the wages of men and boys all round if they would have a vote on it; and they called a meeting to put it to the vote, and the great majority had the money added to their wages, and the beer was discontinued.

13,432. (*Mr. Roebuck.*) I suppose there was an agreement made that they should not get beer into the pit?—It was before the Act passed; there was a clause in the last Act that they should not have beer down in the pit.

13,433. Taking the 3*d.* a day, a man was not to have any beer down in the pit?—No.

13,434. (*Chairman.*) After they were locked out, they said that the grievance was that they had not the beer down in the pit?—Yes. We said, "You "have got an equivalent for the beer, and that can be "no grievance." Still in the speeches they made a great grievance of it all round the district. They complained in the Wyken colliery and others.

13,435. That I suppose was a pretext; what were they really aiming at?—At the Hawkesbury colliery they were asking a rise of wages, I think 6*d.* a day.

13,436. (*Mr. Hughes.*) And you then turned your men out lest they should make common cause?—They said they would, and trade was bad then, and we could not afford it.

13,437. You turned them out lest they should make the same demand?—They said they would.

13,438. You said that you had turned them out before they had made any complaints, that you took the initiative?—They met, and made common cause with these other people.

13,439. You said that they made no complaints but that you took the first action?—They joined with the other men and made a public complaint, but they should have come to us we considered and made a complaint to us instead of joining with the others.

13,440. (*Chairman.*) How long was that strike?—In the neighbourhood it was about nine weeks, I think, the whole of the strike.

13,441. Was there any violence?—They were very violent, so much so in their speeches that they threatened (but we could never lay it to any particular individual) that they would turn the canal into our pit. It would have been very easy to turn the canal into the colliery, and therefore we took the precaution to build strong brickwork in the drift they could turn it by, and we got about 15 or 16 county constables.

13,442. (*Mr. Harrison.*) What year was this in?—1859; and we made a temporary bed for about 16 of them on the pit bank to protect the pit from being drowned out.

13,443. (*Chairman.*) Were any acts of violence done that you were obliged to protect your men from?—They came round in very large bodies, the men joined our men, and the men of perhaps three or four collieries together; men, women, and children came round in a very violent, threatening manner. At one time when it was going on they came round, and I happened to be at the colliery at the time, on the bank. I was sitting on the bridge and they threatened to throw me into the canal, and in the crowd they said they would cut the canal bank and let the water into the pit.

13,444. (*Mr. Harrison.*) What you are describing is the action that was taken generally by the pitmen of the district?—Joined by our men.

13,445. But it was not the action of a regularly established and definite union, was it?—Yes, they pretended so.

13,446. How long had it been in existence?—We could not tell, they came very suddenly to work—all at once.

13,447. What evidence had you that there was a definite established union?—Only what the men said themselves at their meetings.

13,448. What was that?—That they would pay them if they went out.

13,449. We all know that funds in a district are raised very rapidly, without that being in itself

M J. Campbell.

31 March 1868.

evidence that there is a regularly organized society. Have you any other evidence that this is to be attributed to the union specially?—Only from the delegates coming and addressing the men, and their public declarations.

13,450. Where were the delegates from?—From the neighbourhood.

13,451. Of what union were the officials, and what offices did they hold?—I cannot tell now.

13,452. In the year which you speak of the unions were in no degree whatever secret bodies, but at that time they were all public enough, and it is perfectly well known; it is a matter of common notoriety what unions existed, and where they existed, and where their lodges existed. Now, have you no definite evidence as to what this union was, how far it extended, how long it had been in existence, and so forth?—No.

13,453. Well, then, do you not think that this was the common action taken by the pitmen of the district and was not attributable to any definite well-known established union, as you were never able to trace any action of the kind?—We of course could not prove anything except what they said in their own public meetings.

13,454. (*Mr. Roebuck.*) At those public meetings there were delegates?—Yes, addressing the men.

13,455. Did you hear where those delegates came from?—I cannot now remember the men.

13,456. I am not asking you for the men's names, but from what place did you suppose that they were delegated?—They were Staffordshire men.

13,457. Was it well known in the neighbourhood that there were delegates there?—Yes.

13,458. And was there a report of there meetings?—Yes, the papers were full of it.

13,459. And did the papers contain the names of the delegates, or did the papers say that there were delegates there?—I do not remember definitely that there were any particular names mentioned, but they would be reported constantly in the papers at that time.

13,460. And you were fully impressed with the notion and belief that they were delegates from Staffordshire?—Yes.

13,461. And did the fact of their being in your belief delegates from Staffordshire lead to your action in the matter?—Yes.

13,462. (*Mr. Harrison.*) Have you any evidence that they were the officials of or persons who had been sent by any definite established union, and if so what union?—It is very difficult for the like of me to establish those facts. You could get a man that had been in the union to establish them, but these things are kept away from all managers.

13,463. In the evidence which we have had, when we have had testimony as to the action taken by a particular union, we have always had the union designated, the names of the officers, and from whom they came, and the action which was officially taken by the union. But here you are describing a series of acts which were done by the men of a district, and the only evidence of their being organized by means of a union is the fact as you say that people who were called delegates spoke at the meetings?—Yes.

13,464. But you had no official cognizance of any definite society in the matter?—No, they do not come to offer proof to the managers of collieries that they are delegates.

13,465. (*Chairman.*) Do you know of the strike at Staveley in 1866?—Yes.

13,466. Were you in the works then?—Yes.

13,467. Do you know any reason for that strike on the part of the men?—We have a pit in Yorkshire called the North Staveley, eight miles from Staveley, and the first intimation we had of it was on the 21st of August. But on the 14th of August four men came to me to say that some, what they called clod, had come into part of the pit, that is to say, some thickness of bind that had made the coal worse to get. I had seen the overman before that and had understood that that was the fact; and I said to these men, "I understand that you have got clod in your "work. We have come to the determination to offer "you 2*d.* a ton on that part of the pit. Will that "satisfy you?" And they said, "Yes." That was on the 14th of August; the place is eight miles from Staveley, and I had a letter from the overman there, giving me a report every day. A few days afterwards a report came to say that there had been some meeting at the works called Swallownest, close by, and that our men were joining the union, and coming out of the pit at 2 o'clock, and stopping the work. I went over at 1 o'clock to wait till the men did come out, and at 2 o'clock the whole body of workmen did come out of the pit. I said, when the first of the men came out, "I wish you all to stop till the other men are up. I want to speak to you," and when all the men were up I said, "Now, men, a "deputation of four from this pit met me on the 14th. "You made a complaint, and the only complaint that "you made was that you wanted a little more on the "south side of the pit, and I said I would offer you "2*d.*, and you took it, and said that you were "satisfied. Now how is this, that here on the 25th "I have had to come to you, and now for several "days you have gone out of the pit at 2 o'clock "without any notice." They said, well, they thought that eight hours was quite sufficient to work; and I said, "Well, I think eight hours plenty for a stall "man to work, and stall men are only working that "now, but you ought to go in and get your first shift "ready, and come out at eight hours, and let the "other men keep in the pit drawing 10 hours." They said, "We will not do that, the pit shall only draw eight hours." I said, "Do you mean to say that you are going on the Barnsley system," and they said, yes, they did. One of the men particularly spoke for the rest at first, and said, "Yes, we do, and we will do no other." I said, "Very well, you have no complaint to make of wages, have you?" "Not particularly, but," he said, "we have determined not to work." I said, "We cannot allow it to go on in "this way, we will have men that will work as we "require. If any man here thinks that he can do "better for himself, I do not require the fortnightly "notice, he is at liberty to go now, because we will "have the pit carried on according to our rules, not "according to yours." And this man who was speaking said, "Well, I will go for one." I said, "Very well, you shall have your wages and go." He went on speaking, but I said, "Now your question is done; let "somebody else speak; you have had your choice "to leave the colliery; let somebody else make com-"plaint. Is there any other man to make a com-"plaint?" and the others said that they had no particular complaint to make, but that they would only work eight hours. I said, "You have only worked "eight hours as stall men. I do not want you to "work more; but I want the pit to draw 10 hours." They said that they would not have that. "We are determined that you shall," I said, "we will not have "the pit working under your rule, and any that are "willing to go now can go. At the proper day for "giving notices I shall come here, and every man "that will not work according to our rule I shall "give a regular notice to. You will have time to "think of it." And on the proper day I went round every stall in the pit, and said to each man, "You "know what I am come about? are you going to "work the pit in a proper manner?" Some men said, "I will do as others do." I said, "If others stop, will you?" I did not wish to push them hard, so I only gave notice to eight stalls. I thought that that would be sufficient to let them see that we were determined. In a few days (they would not be advised) all the men came out; there were two stalls that stopped in and worked the proper time in that fortnight. I went back to the men the next fortnight again, and the men that would not work according to the rule I gave notice to also, and I think in about three fortnights all the men that would not work

according to the oule got notice, and the other men that chose to work the proper time stopped at the work and worked the proper time, and then when I got the pit clear I sent off into Stagordshire to look for some men, and brought three or four at a time. They were met at the railway stations, and if they got them alone, or in fact if a man brought them they were offered money to go back, and as fast nearly as we brought them they sent them back; perhaps about half and half; that is to say, half would go back and half would stop. On the 11th of September (we had no houses for them then) we went and engaged some houses and began to build houses close to the colliery. We had 15 houses in a little village called Heighton, I think, and the men were much annoyed there and intimidated and threatened; and on the night before Christmas Day, 1866, a number of those men together got a riot up and beat them very much, and then on Christmas morning again I went to the colliery and examined into it with Mr. Markham, and we got summonses for six or seven men. I think they took them before the magistrates at Rotherham, and I think that we were four or five days before the magistrates. Some of the men were punished, but the evidence was very conflicting. We have had peace since; a good deal of shouting, but no violence.

13,468. You are going on at Staveley?—Yes, but that was North Staveley. In the meantime, when that was going on, there was another large meeting published in the papers, I believe, for the 3d of September 1866.

13,469. What became of that strike?—I think that all the five collieries that we have at Staveley stopped. We had so few hands that we could not make any work that day; they all went to this large meeting.

13,470. (*Mr. Roebuck.*) Was that meeting held at Chesterfield?—It was collected about half a mile from the Staveley works, and then they marched to Chesterfield.

13,471. (*Chairman.*) Who collected it, do you know?—Mr. Brown, it was said.

13,472. Mr. Brown had a meeting and the colliers attended?—Yes.

13,473. Did you hear him address them?—No, I did not.

13,474. What was the result of his address?—He addressed them at Trough Brook, I think, and went on to a little village near Brimington and got a field there, and I think went on from there to a place near Chesterfield and kept the meetings on all day. I heard so.

13,475. The effect upon your men was that the colliery stopped?—That day it stopped altogether.

13,476. Did they strike afterwards?—A great many men came to work the next day, but the pit was not well attended, not to its average. And immediately after that the men began to make demands, they found fault with every little thing in the pit that they did not notice at other times.

13,477. Did that lead to any action on the part of the proprietor, Mr. Markham?—Yes, if the men made themselves very obnoxious in the pit, we gave them a proper notice to leave.

13,478. My meaning was, did anything about unions take place?—We asked them if they did this in consequence of any union, and the men generally, said it was so. We said, "Very well, we will not have "you here, it is only delaying the working of our pit, "go and get work where they want union men, we do not want them here."

13,479. From that time has Mr. Markham kept out the union men as far as you know?—Yes.

13,480. You gave notice to the union men?—We did not give notice to all, we did not know all. We gave notice to all who were so obnoxious that we could not do very well with them in the pit.

13,481. According to your experience does the union produce advantage for the workpeople?—I have never seen it do so.

13,482. Or for the employers?—No.

13,483. Or for the trade?—No.

13,484. The suggestion is that the workman by himself may not be able to stand against the master, but that when backed by the union he is a match for the master. Have you ever seen the useful action of the union in that shape?—Never.

13,485. Have you ever seen a master able to oppress the men when he as a large number of them, say 200 or 300 under him?—I think not.

13,486. A single man of course, a master, can oppress, but not a large body you think?—No.

13,487. (*Lord Elcho.*) A question has been put into my hands which I have been asked to ask you. Do you know as a fact that many of the owners and butties have drinking places now to induce men to drink?—I do not know of any case of that sort, we have nothing of the kind at Staveley.

13,488. (*Mr. Harrison.*) You gave us a long account of what had taken place at North Staveley in a certain year. Now I wish to ask you if you will tell us how you connect the facts which you there spoke to with the subject of this inquiry, which is trade unionism?—They were recognized trades union delegates, or were reported to be such, addressing the men there. I did not hear them.

13,489. There was a dispute which you had with the men, you have just told us, a dispute about working in a particular way when you wanted them to work in another. Were those men members of trades unions?—They said they were.

13,490. Were they acting under any rule of the union or under any directions of the union?—They said that they were.

13,491. What union?—They said that they were working under the South Derbyshire union.

13,492. How long had it been in existence?—I do not know.

13,493. How long had you known that they had been members of the union?—I did not know it at all. I knew nothing about it till the 14th of August, when they came to me to ask for a rise in a part of the pit. I knew nothing about our having any union men there then.

13,494. What did they say?—They came to ask for a consideration in a part of the pit where some clod had come in.

13,495. Did they tell you then for the first time that they were members of the union?—No, I did not suspect anything about that.

13,496. When did you find it out?—A very few days after I had given the 2*d.* a ton extra an overman sent me that report, that the men had come out of the pit at 2 o'clock, and I concluded then that they were going on with this, and I went to ask on the 25th, and I stopped the men that came up and put the question to them whether they were carrying this out in the form of a union rule; and they said that they were.

13,497. Did they say that they were members of a union?—Yes.

13,498. You asked them that?—Yes.

13,499. And the only men who were then on strike of whose conduct you have been speaking were members of the union, the non-union men not being engaged in the dispute?—The non-union men said that they were obliged to come up because the others made them come up. I told them that I should remove the men that were connected with the union, and that they should do as they liked.

13,500. When what was called the Free Labour Association at Staveley was started, but which does not now exist in that form, was that, strictly speaking, a voluntary movement amongst the men, or was it promoted by the managers and other officials of the company?—I can only say that I know nothing about it. Some of the men had complained against it, that there was a great deal of ill will amongst the men from forcing others to join also I heard, and some time afterwards I heard that some of the men had called a meeting; I had not the remotest idea about it at the time.

13,501. And you knew that none of the officers or

Mr. J. Campbell.

31 March 1868.

of the managers of the company were instigating that movement, is that so?—I knew that I was not, and I believe that Mr. Markham was not, and I believe it entirely sprung from some of the workmen.

13,502. (*Mr. Hughes.*) Did the proposal for compulsory deduction from wages come from the working men?—What proposal?

13,503. We had evidence from Mr. Markham that, with regard to the accident and sick fund which was established in connexion with this Free Labour Society, or whatever its name was, there was a compulsory stoppage of so much a week from all the wages?—I do not know that that is connected with the Free Labour Society.

13,504. I understood from him that that was the case?—It had been talked of for months before to get an accident fund in addition to the sick fund.

13,505. I only want to know whether the proposal for the compulsory deduction from the wages, which is the rule at present at the colliery, was suggested by the employers or by the workmen?—I think that the rules were entirely drawn up by Mr. Markham and a committee, and shown to the workmen, and they were consulted in it.

13,506. In fact you hardly know which side it came from?—I think myself that it would be from Mr. Markham the manager.

13,507. (*Mr. Roebuck.*) That is, the mode of the men's paying to the accident fund was that from the wages was deducted the sum that they subscribed to the accident fund before they received their wages?—Yes.

13,508. And that is now called compulsory payment; but was it not perfectly agreed to by the men?—Perfectly agreed to. I do not think that there are five per cent. of the men that demur to it. I never heard of any.

13,509. (*Mr. Hughes.*) When I say compulsory payment, I mean that every man who works at your colliery has no option as to whether that sum shall be deducted from his wages or not?—No, certainly he has no option, he knows that that is the rule of the colliery.

13,510. I should just like to call your attention to the only strikes in which you were engaged while you belonged to the union. There were three you said between 1825 and 1827. The case of the first strike, I understood you to say, was that the employers were employing certain persons to whom the men objected?—Yes, but away from the work that I was employed in.

13,511. In that strike the men were successful; the men got what they wanted?—The masters gave in.

13,512. With respect to the other two strikes, do you remember what they arose about, and whether they were successful or not from the men's point of view?—I believe that they were successful, but I believe that they were an injury to the men themselves.

13,513. So far as you remember, you think that they did gain what they wanted then, whether they were right or wrong?—I believe they did, but they did not gain it through me.

13,514. Again in the strike in 1844, in Mr. Stephenson's colliery, you said, I think, that your men were only out a few weeks?—Three or four weeks.

13,515. They went in much before the others?—Yes.

13,516. The men at your colliery obtained nothing by that strike?—Nothing at all.

13,517. Do you remember why the men at the other collieries staid out longer than at yours?—I do not.

13,518. Do you know whether they got anything?—I believe none in the whole district got anything at all, only misery.

13,519. (*Earl of Lichfield.*) With regard to this compulsory deduction for a sick fund or accident fund, do you know what the amount deducted is?—I think it is 2*d.* a week.

13,520. Have you ever heard any of the men complain of that regulation in the colliery?—Never.

13,521. Do not you think that some such arrangement is almost a necessity where a very large number of persons are employed?—I believe that it is a very great benefit, and I can only tell you that we have nine men, working men, that attend (I am on the committee myself) the meetings, and questions about whether the men deserve help or not are left to them, and some cases must be left to the committee. Those men had the best opportunity of knowing whether there is any imposition or not, and they are requested to have a list of the sums of money paid in the month pasted up at every pit bank that the committee men may see if there is any imposition. A few have grumbled, but not a great many; on the whole, it is perfectly satisfactory.

13,522. Do not you think that if any man had any reason to object to this deduction, he would go to a neighbouring colliery where he would receive the same wages without the deduction?—Yes, he may do so.

13,523. And there is nothing to prevent his doing so?—No; but I consider that the men would much rather have it according to our plan, because if a man chose to go to a neighbouring colliery now, the scale of remuneration for an injury of any sort is according to time in a great measure. But if a man leaves our colliery and comes back from time to time, the whole time that he has been there is always counted. He does not lose anything by going away and coming back; the time that he has served in the colliery counts up, whatever it may be. We have a great many men now who it might happen would get 100*l.* in case of any serious injury.

13,524. Have you ever heard any comparison at all made by any of your men between the amount they contribute to this fund of yours, and the amount which they would have to contribute if they were members of unions?—Yes, I have.

13,525. What have you heard them say with regard to that?—A great many say that the union fund was a fighting fund, that it is only a promise that they make and they do not expect that they will get anything from it except at first.

13,526. (*Mr. Roebuck.*) "A fighting fund" you say, that is to say, a fund used to enable them to sustain a conflict with their masters?—Yes, for the time being.

13,527. (*Mr. Harrison.*) Is it within your experience that the union does not pay the benefits that it offers?—If I take the evidence of the men they tell me that they are not paid generally, except a short time at first.

13,528. By what union had the men not been paid the benefits promised?—This union in 1866 I can remember best, because it is the most recent.

13,529. How long had that been in existence?—I never knew it was in existence, it came upon us all at once.

13,530. Was it a union at all?—They called it a union, I cannot tell.

13,531. (*Mr. Hughes.*) The subscription to this accident fund is 2*d.* a week?—Yes.

13,532. Have you had any calculations made as to whether it will meet accidents at the rate of 100*l.* a man?—I believe so. I know that is so in fact, because I saw a letter with all the circumstances, the number of deaths and accidents, for six or eight years, which had been sent to Dr. Farr in London. To draw comparisons we gave him the information that we had from the other fund for that time.

13,533. And did he think that your subscriptions were sufficient?—He thought them sufficient with the amount that the colliery company would give. I think they will give 500*l.* for four years, and then 25 per cent. on all the subscriptions.

13,534. But then Mr. Markham told us that your subscriptions were arranged so that there should be no large accumulations?—The committee has the power to make it so; we rather think that there will be an

accumulation, and the committee has the power to raise the subscriptions.

13,535. As yet you have not had any considerable accumulation, as I understand?—No, very little.

13,536. Mr. Markham told us that the system was, that it should only be from hand to mouth as it were. But supposing that you raise the subscriptions so that there should be a considerable accumulation, would a man leaving your colliery who had subscribed for so many years by the deductions out of his wages, have any claim to any portion of that?—No.

13,537. (*Earl of Lichfield.*) Unless he had met with an accident I suppose, and in that case he would be paid?—If he meets with an accident the first day that he comes into our pit, he would be paid in the same way as a man who had been five years there.

13,538. (*Mr. Hughes.*) Not after he had left your pit?—No. There is not supposed to be any accumulation, but lately we have rather considered I think that there might be accumulation, and the committee have given donations or subscriptions out.

13,539. (*Mr. Harrison.*) If there was unfortunately an explosion in your colliery the accident fund would be unable to meet it, I suppose?—Yes, very likely, but I do not fear that much.

13,540. (*Lord Elcho.*) But supposing that a man working in your colliery and a subscriber to this fund meets with a serious accident, and say 50*l.* or 100*l.* is awarded to him, and he leaves you before that is completely paid, he would receive that, would he not, although he is no longer in your service?—Certainly.

13,541. (*Mr. Hughes.*) But as soon as a man leaves you he would receive nothing for an accident?—If he has had no accident. But he does receive this benefit, that at whatever time he leaves if he returns his time is counted, and he is then a subject for remuneration.

15,542. (*Mr. Roebuck.*) Are you at all conversant with what is done in an ordinary insurance company? Supposing a man has an insurance on his own life for 30 years and then leaves off payment for six or seven months, do you know whether or not he loses all claim upon the insurance company?—I do not know.

13,543. (*Mr. Hughes.*) Do you know what is the ordinary course in trades unions, that when a man has subscribed a certain number of years, when he leaves he ceases to have any claim?—I know that when he has subscribed he gets nothing at all many times.

13,544. (*Mr. Harrison.*) You know that, do you?—By report from the men I know it.

13,545. What are the sources of your information?—I have heard men say so that have been in trades unions, and have been promised something and got nothing at all.

13,546. (*Lord Elcho.*) Could you name those unions?—Yes.

13,547. What are they?—The colliers' unions I refer to.

13,548. At what colliery?—The colliers' union that made the strike in 1844.

13,549. Does it still exist?—I do not know; they all seem to me to be formed upon much about the same principle while they lasted.

13,550. (*Mr. Harrison.*) "Union" is rather a vague term, is it not; you appear to be occasionally using it in the sense of the pitmen of a district who join together for the sake of making certain demands; and then at other times it is a regularly constituted society such as the amalgamated engineers?—I can call it nothing else. I never knew it exist, but it made a spasmodic effort for a time and then it was blown out.

13,551. You do not know, for instance, of the existence of the South Yorkshire Miners' Association?—I know that they had one in Staveley in 1866; it does not exist in Staveley now I believe.

13,552. I am not speaking of Staveley. I ask, are you aware of the existence of a society called the South Yorkshire Miners' Association?—Yes.

13,553. Do you say that that is merely a temporary and spasmodic combination of men?—As far as public report goes, that has existed for a few years, but I think it will come to nought; that is my opinion.

13,554. (*Mr. Hughes.*) Let me ask you this question. Supposing that an organization of that kind could be founded which would not be spasmodic and would not come to nought, and which enabled the men to have a very considerable influence on the rate of wages and the hours of labour; looking at it as far as you can from an independent point of view, do not you think that that might be a very beneficial thing for men as well as masters?—I think not.

13,555. Not if such a body met the employers on equal terms and consulted with them on the conditions on which trade should be carried on?—I think that no body of workmen could take the risks of a colliery, as far as my experience goes.

13,556. But do not you think that supposing masters and men were to agree to meet and consult on such matters, it would be better for the masters as well as better for the men that the organization on the men's side should be acknowledged and strong, than that there should be these sudden rises?—I think that fair competition between labour and capital, which the colliers have an opportunity of in all districts like Derbyshire, is much the best thing for the men. We are obliged to use our men well.

13,557. But capital is thoroughly organized; the employers are thoroughly organized necessarily, are they not?—Well, we are obliged to use our men well. If we did not use them well they would not stop with us; it is our interest to use them well and fairly.

13,558. (*Mr. Roebuck.*) Do you think that the management of your collieries would be improved by admitting into your managing power the opinions of the working men?—Certainly not.

13,559. Are they not in the greater number of cases very ignorant men, and men who really do not know about the exingencies of trade?—Certainly; that is my belief. They know nothing at all about it.

13,560. And therefore if you were to bring them in to be partners in your consultations about your trade concerns, you think that you would be very much under the guidance of ignorance?—Yes.

13,561. And therefore you object to the introduction of working men into your partnership for the government of the working of your colliery?—Yes.

13,562. (*Mr. Harrison.*) Do you think that your men are so ignorant that it would not be right that they should express any opinion as to the mode in which they should be employed?—I do not think that the colliers as a class are ignorant about their own work at all.

13,563. You think it is reasonable that the miners should form and express their own views as to the way in which they are being employed, and as to the details of their mannual labour?—Yes, but not to take the management of the colliery.

13,564. (*Mr. Booth.*) You think that the owners of a colliery can manage it better for their own advantage as well as the advantage of the men without the interference of the union?—Much better, that is my firm opinion.

13,565. (*Mr. Harrison.*) Is it within your experience thet the colliers take the management of a colliery in any place?—Yes, whenever they get under the influence of a union it is so.

13,566. Where has it been so?—North Staveley is one example that I have already given you. First they come up and say that they will not work more than eight hours, whereas we wish the pit to draw ten hours.

13,567. Do you call that taking the management of a pit?—Yes, I do.

13,568. Do you think that the men should not have any voice as to the number of hours that they should work?—By all means.

13,569. (*Earl of Lichfield.*) Does not that arrangement as to the 10 hours involve the necessity of keeping some men at work during the whole number of hours?—The stall men are a superior class of workmen, two or three or more may have a stall 40

Mr. J. Campbell.

31 March 1868.

yards in length. They will go down in the morning and get the necessary work ready. They may go down at 4 or 5 o'clock if they like, they will get ready a portion of their own work for a more inferior class of workmen to commence upon at half-post 6 or 7 o'clock, whatever time the pit begins to work. The stall man who goes in at that time may come out in seven hours (and they do) or in eight hours, but another man, his partner, comes in at 8 or 9 o'clock, whatever time he likes, and he stops to see all the coal out of his stall. Now that man without any interference with the work of the colliery can regulate his work without working more than eight hours.

13,570. Are there not some persons who would be compelled to work during the whole number of hours that the pit is at work?—Yes, the loader for instance. He is an inferior class of collier; you can make a loader of a plough man, or anyone that has been working above ground, and he is perfectly willing to work the longer hours and he must be at work the ten hours that we work now.

13,571. (*Mr. Roebuck.*) Is there any interruption in that ten hours for dinner?—Half an hour for dinner.

13,572. Is there any other?—Not a time to stop, but the men are supposed to take a little any time they like.

13,573. But for the half hour that they have for dinner the pit stops?—The pit stops drawing then entirely.

13,574. (*Earl of Lichfield.*) Have you ever objected to meet your men when they have had any complaint to make?—No, never, except that in the time of the union I objected to meet men that had given notice.

13,575. At your colliery there is an opportunity for the men to bring forward any grievances?—Whenever they like they can meet me in the presence of their overman or without the presence of their overman, and if they are not satisfied with seeing me they can meet the managing director.

13,576. (*Mr. Roebuck.*) They go direct to Mr. Markham without coming through you?—Yes, they have no occasion to come through me, they can go to him if they like, but they do not often do it.

13,577. (*Lord Elcho.*) You have had a great many years' experience, and you have referred to strikes that had taken place in collieries, some of which have been successful and some of which have not as regards influencing wages?—I never knew any succeed except that carpenters' strike—on a small scale that was successful.

13,578. When these strikes have taken place you have been aware of the state of trade as a viewer?—Yes.

13,579. Do you believe that these strikes or the action of the unions have really influenced the rate of wages?—They have injured it in all cases I believe.

13,580. Do you believe that the effect of the action of a union does not even anticipate a rise or check, a natural fall in wages. Supposing for instance that in course of trade the probability is that if there were no union wages would rise and the men strike sooner than that rise would naturally come, do you think their action is effectual in that respect?—I think we should more likely be able to give them more wages if they had not struck, from the better trade there would be.

13,581. In the same way where there would be a mutual fall in wages, do you believe that the unions tend to check that fall?—There is not very often a fall in wages. Wages from my own observation have got very much up since I was connected with collieries. Going back to 1832, collieries are in a much better position now than they were then, but I believe that none of that has been caused by the union to the bettering of the condition of the colliers.

13,582. Then your belief is that the unions and these strikes have really had no beneficial effect as regards the wages of the working man?—Not the least.

13,583. That if they have risen they would have risen without the working of the union?—Yes, certainly.

13,584. And that they have been accompanied, as you have stated to us, generally with a great deal of suffering and distress?—A great deal of suffering. There are men in our works that I suppose will never get over this last strike.

13,585. According to your view there is no set off against the suffering and distress attendant upon a strike, because even assuming that there is a rise, that rise would have taken place whether there had been a strike on or not?—Yes, but I have never seen a rise in my own experience.

13,586. Have you never seen a rise after a strike?—Never a rise caused by a strike.

13,587. You maintain that that rise, if it does take place, would have taken place equally whether there were unions or not, whether there was a strike or not?—Yes, that is my opinion.

13,588. (*Mr. Roebuck.*) So that wages in fact depend upon the state of trade and not upon the interference of the unions?—That is my opinion entirely. Clay Cross, for example, is the largest neighbouring colliery to us. We do not want our men to go to Clay Cross. How can we help that? Only by making them as comfortable as we can at our own works, and on their part they do the same at Clay Cross. I find that we have got nearly all the men back to Staveley now that went off at the union time.

13,589. (*Mr. Hughes.*) I see in Mr. Markham's evidence that he used the words "10 to 12 hours"—you say that 10 hours is the time the pit works?—We always work 10 at North Staveley.

13,590. Was not one of the demands there for a shortening of the hours?—There was a demand, but that would have been given without the union.

13,591. But it was not given without a strike?—It would have been.

13,592. It is possible then that the men may think that that hour and a half was gained by the union?—They may think so.

13,593. How can you be sure that it would have been given without the strike?—I may say that Mr. Appleby has been working on that system some time ago, and that at another colliery of the name of Wells, the proprietors have been working about that time, 10½ hours. Of course we were not going to let our men go away to them. So the trade does it, not the union.

13,594. But do you know how it was done at those other collieries?—I do not know that.

13,595. But at yours it was done through that strike, or at any rate after that strike?—Yes, after it.

13,596. (*Mr. Harrison.*) Do you know that all the men of the South Yorkshire Mines Association work eight hours and not 10½?—Yes.

13,597. Do you think that the union has had anything to do with that shortening of the hours of labour?—I think they have in that case. But our skilled men only work eight hours; that is to say, the stall men only work eight hours; the pit may work 10, and they work their eight hours.

13,598. You do think that the South Yorkshire Association has done something to shorten the hours of work for its members?—No, it has not shortened the hours; it has shortened the hours of drawing the coal but not the hours of the skilled colliers. That was their mode of doing it, but all I requested our men was to do it in the mode that would not impede the drawing of the pit.

13,599. But do you mean to say that since the establishment and extension of the South Yorkshire Association, the stall men do not work now shorter hours than they did before it?—I do not know what they worked before, but I know that our men only work eight hours and they did not work more before.

13,600. Do you consider that the hours for the same class of men are the same practically in your district and in South Yorkshire?—No, because there the pit only draws the eight hours, I believe; I understand so, but I am not sure.

13,601. Then there is a difference in favour of the South Yorkshire district?—Yes, at some of the places, but not all.

13,602. Do I rightly understand you when you speak of a union being in a district to mean this, a number of the pitmen of a district meeting together and determining to ask for a certain thing or to obtain a certain rule, choosing delegates who go and represent their views, and collecting funds for the purpose of supporting themselves in some strike which is immediately contemplated—you call that a union, do you not?—Yes.

13,603. But that is a very different thing from an established union of which the members are known and which has its regular officers, such as that union which now exists in the South Yorkshire district, and it is totally different, is it not, in its effect upon the trade?—No, because in 1866 in Staveley it was said to be so; they said that they were connected with all the unions in England according to their own report.

13,604. That they said that they were connected is a very different thing. Do you mean to say that at that time they were a regularly admitted branch of some definite established union?—They said they were according to the report.

13,605. With regard to what you have said about a union being formed in a district, one knows that ever since pits have existed pitmen have been in the habit of meeting together; when they think they have a grievance they determine to obtain its redress, or they consider it, and perhaps some one comes from a neighbouring district and tells them what is done there, and offers them, say 100*l.*, to assist them. That is a totally different thing from an association which exists for eight or 10 years and which has its funds and its registered members, is it not?—I think not. I think it is all the same system.

The witness withdrew.

Mr. George C. Greenwell examined.

13,606. (*Earl of Lichfield.*) Have you had considerable experience in the management of collieries?—I have.

13,607. How long does that experience extend over?—About 30 years.

13,608. In what districts?—In the north districts, Northumberland and Durham, and also in Somersetshire and Cheshire.

13,609. And have you had a considerable number of men under your management in all those cases?—Yes.

13,610. You are now the agent of Lord Vernon's colliery in Cheshire, I believe?—Yes.

13,611. How many men are employed in those collieries?—Between 600 and 700.

13,612. Have you had any experience of trades unions, or have you had anything to do with any complaint of strikes in any of these districts?—Yes, I have had a good deal to do with them from first to last. The first strike that I knew anything about personally was the strike of 1844, in Northumberland and Durham. There were about 30,000 men on strike.

13,613. What was the cause of that strike?—That strike arose out of a change from the system of yearly hiring to monthly hiring. Up to April 1844 the men were engaged by the year, and there were certain conditions in those terms which obliged the owners to find the men work, or to pay them if they could not find them work. There was a dispute that arose in 1843 as to the employment of wire ropes, I believe at Wingate Grange Colliery, near Durham. The men refused to work with this wire rope, and lay all idle, and they claimed wages for the time that they were off work. That was resisted, and it led to a long protracted trial in which the men lost their case. However, that and other causes of complaint, fomented by Mr. Roberts, who was employed by the pitmen at the time, so offended the masters with the old system, so to speak, that they resolved that they would not have any more of these yearly agreements, but that they would bind the men by a monthly agreement to commence at the end of the then year during which the men were engaged. Previous to the 5th of April 1844 the men asked for a very large advance of wages. That the owners met by refusal, and by a stipulation that the engagement should only be from month to to month. That led to a strike which lasted 17 or 18 weeks, and which ended in the men going to work on the masters' terms.

13,614. Was that brought about by the union?—Yes; I believe that there was a conference between the English members and the Scotch members of the union at that time; that the English miners were in favour of the strike, but that the Scotch were opposed. At any rate the English miners did strike and the Scotch did not.

13,615. (*Mr. Booth.*) I think you said that the strike failed in its object?—Yes, it failed in its object.

13,616. (*Earl of Lichfield.*) Can you refer to any other strike?—Yes, a strike which took place in 1849 and 1850. The union ceased after 1844, but not completely; it still kept a sort of status in the district, and from time to time it was revived, but towards 1849 it got a little more strength, and they then resolved upon another trial with the masters, but they thought then that they would go in a different way to work. They found that when the whole of labour was arrayed against the whole of capital, capital got the better, and they thought that by having isolated strikes here and there, the people on strike being supported by the rest of the union, they could beat the masters in detail, and they selected a colliery that I was at at the time, Marley Hill, to try that plan. The owners of Marley Hill made coke to a large extent, and had a large number of coke ovens to keep supplied with coal. They had contracts with different railways to supply this coke. That, as being a place where the masters could ill afford a strike, was selected for the men to try first. They applied for an increase of wages, which was refused, and they then restricted their labour to an amount which would produce about 3*s.* a day instead of from 3*s.* 9*d.* to 4*s.* They found that that did not do, because the owners got supplies to make up the deficiency from adjoining collieries. They then still further restricted their labour to 1*s.* a day as the wage that they would work for. When it came to that, and the owners found that it was really a strike on the part of all the workmen, they made up their minds to get labour from other districts. They sent down to Scotland and engaged some men, who were brought up. It was necessary to take possession of the houses for the purpose of accommodating these men, and the houses were taken possession of by the owners, but it was necessary to have a large force of police, and so on, in order to keep the peace. There were two collieries near to Marley Hill, from which coals were brought to supply the coke ovens to make up the deficiency occasioned by the restriction on the part of the men. To one of these collieries a few men went one night with blackened faces and drove away the firemen from the boilers, and put a quarter barrel of gunpowder under each boiler and blew them out of their seat. That of course stopped that pit from working. At another pit the coals had to come along the North-eastern Railway, across a deep dene called the Causey dene. On that embankment they put a rail across the line, and sent about 16 wagons down 80 feet. In point of fact, they so intimidated the men of the neighbourhood that they gradually ceased working. However, the owners were determined that they would go on as long as they could, and they did; and the men gave way, and they went in on the same terms as origi-

Mr. G. C. Greenwell.

31 March 1868.

nally. There were never any more strikes there so long as I was there.

13,617. You have referred to the engine being blown up. Have you any reason for attributing that to the union?—The only way that I could connect it with the union was this: When the men were turned out of the houses, there was an action brought against one of the owners for damage done to the furniture, and the person who managed the case for the Plaintiffs was Mr. Roberts who was the legal adviser of the union. And there was also some correspondence which took place at the same time in the newspapers, and that was conducted by a Mr. Martin Jude, who was at that time the secretary of the union.

13,618. Can you refer us to any other strike?—Yes; when I was in Somersetshire we had a strike, when I had the management of Lady Waldegrave's collieries. That was in 1863; it was a short strike and lasted about three weeks. The object of that strike was to make me discharge an underlooker whom I had engaged from the North.

13,619. Do you connect that with any union in any way?—No, it was a simple strike for that simple purpose.

13,620. What would your definition of a union be?—I think, generally speaking, that a combination of workmen which may take place at an individual colliery cannot be called a union, because that is a mere family matter. But I think that immediately it extends beyond the precincts of one colliery, and a combination is made between that colliery and another colliery, then it becomes a union which becomes greater in degree the greater the number of collieries connected together; but still it is a union as soon as it goes beyond the colliery itself.

13,621. (*Mr. Merivale.*) You call it a union though it may not have printed rules?—Yes.

13,622. (*Earl of Lichfield.*) Is there any other strike that you wish to refer to?—Yes. We had a strike about two months ago in Cheshire. It was a pretty general strike in the Ashton district which comprised the Poynton district as well.

13,623. Was this at your colliery?—Yes, that strike commenced on the 18th of January this year and lasted very nearly a month, if not quite.

13,624. (*Mr. Hughes.*) What was the object of it?—The object was to prevent taking off the rises that had been made in wages while the times were better.

13,625. (*Earl of Lichfield.*) What was the amount reduced?—8½ per cent.

13,626. That was a reduction which you proposed to make, and the men struck against that reduction?—Yes, the men struck against that reduction.

13,627. How long did they remain out?—Nearly a month.

13,628. And what was the result?—They went to work at the reduction.

13,629. Do you think that the course that the men pursued in that case was the result of a union?—Yes.

13,630. Is the union which you refer to now a union in that district, or does it belong to some other part of the country?—It was in the Ashton district. According to the best of my belief there are different district unions combined together under the head of a union of a somewhat national extent. Each of these separate unions has the management of its own funds and the appointment of its local officers. For instance, there is the Wigan district, and there is the Ashton district, and there are others, and I do not know whether the South Yorkshire district may be stated to be one or not, but the Wigan and Ashton I believe to be branches of the General Association.

13,631. Do you consider that colliery owners lately have had greater difficulty in carrying on their collieries regularly than they used to have?—I consider that they have.

13,632. Do you attribute that to the unions?—Yes. I think that generally speaking when the men are in a union they are not so obedient to order, they are a little more independent in their manner; and if you give a man directions as to what he is to do, he is a little more hoity toity, if I may so speak.

13,633. Do you find yourself that you have greater difficulty in the management than you used to have?—Yes, I think so. I do not think however that I have so much more difficulty as I have heard others say they have had; certainly I have had some difficulty, but when my men have come to me and talked about questions of difference, I have not opposed myself point blank to the union; but to a certain extent so long as they conducted themselves properly, I have admitted a certain right that they have to have a union, I have not gone dead against it, and perhaps that is a reason why it may not have affected me so seriously as others.

13,634. You never objected to employ men on account of their being in a union I suppose?—Not at all.

13,635. As I understand you, what you object to is the interference of a union having no connexion with your collieries?—Yes.

13,636. And interfering in what you consider that you must know better than they can?—Yes.

13,637. (*Mr. Merivale.*) Has there been much fluctuation of wages since you have been familiar with this business, have they gone up and down much?—Yes, a good deal.

13,638. Do you find that the difficulty of dealing with workmen is greater when wages are high or when they are low?—It is greater when they are high.

13,639. Whether there are unions or not, it is not so easy to deal with them in a high wages time as in a low wages time?—No.

13,640. (*Earl of Lichfield.*) Do you think that the men in your colliery are capable of protecting themselves without the assistance of the union?—Perfectly well.

13,641. (*Mr. Booth.*) Do you allow free access on the part of your men to yourself on all occasions?—Yes, I always encourage it; I do not like deputations coming to me, I like the body of men coming to me themselves.

13,642. Is it your opinion that the union men care less for the good opinion of the master than those that are not in the union?—Men that are in the union care less for the good opinion of the master than those that are not in the union.

13,643. (*Mr. Merivale.*) Have you noticed any difference in general conduct and character between union and non-union men independently of their demeanour towards their master?—I can only repeat what I have said before, that I think the union men are more independent and less amenable to direction and instruction.

13,644. In general respects, in honesty, morality, and so on, have you noticed any difference?—I would not say anything about honesty and morality, that has not come before me.

13,645. (*Mr. Hughes.*) In the 1844 strike, which failed in your district, do you remember what rise was asked?—I think in some cases as high as 33 per cent.

13,646. Do you remember what the wages were then?—I believe that the wages of the district at that time were about on an average 3*s.* 9*d.* per day.

13,647. And the demand was for 33 per cent. on that?—In some cases; I do not know that it was that in all cases.

13,648. And was no rise obtained?—None whatever I believe.

13,649. The wages are much higher now than the figure you have mentioned?—Yes.

13,650. Can you say how soon after the 1844 strike the rise took place?—No. In 1849, at the time of that strike that I was speaking about, the wages at Marley Hill were something like 3*s.* 9*d.* to 4*s.* a day.

13,651. Then they had not risen between 1844 and 1849?—When I am speaking about the wages in 1849 I am only speaking about the wages in the Marley Hill colliery.

13,652. Then at Marley Hill in 1849 the cause of

the strike was an application for an increase of wages? —Yes, an application for an increase of wages.

13,653. Do you remember what increase they asked?—I cannot exactly say, but according to the best of my belief it would be as near as I can recollect 15 per cent.

13,654. And you say that they did not get that?—No.

13,655. But they have got it since, and more?—I think they may; but it is attributable to the improved state of trade and not to strikes.

13,656. Then, as far as your judgment goes, the very large rise in wages which has taken place all through those districts which were affected by the strikes of 1844 and 1849 has taken place not through the unions but spontaneously?—I think so; I would like to give a little qualification, however; I do not wish to give that answer point blank. I do not mean to say but what unions may have had something to do with the rise of wages, because when times are good people rather than submit to a strike would give an advanced wage, because they do not like the threat of a strike to be carried out.

13,657. You think that the natural wish of coal owners to do the right thing and to treat their men justly would have raised wages as rapidly without the union?—I do not exactly say that.

13,658. I wish to have your judgment on that point?—I think that the increase of prosperity in the business with the increase in the demand for coal increased the demand for labour, and that therefore the price of labour rose because its value increased. I do not think that the owners are such angels that they would give a rise quite of their own accord, but I should say that the owners gave it because they were obliged to do it in order to get labour.

13,659. And that the unions had scarcely any influence on that rise?—I have said that the unions had some effect, because the owners rather than risk the strike would give them an increase in wages.

13,660. (*Mr. Booth.*) But the rise would have taken place from general causes pretty soon without a strike you think?—I think that the demand for labour would have done gradually that which perhaps the unions hastened in the first instance.

13,661. (*Earl of Lichfield.*) What was the course pursued in the last strike which you have referred to in Cheshire; did the men come to you and give any reason for refusing the reduction?—The advances that had taken place previous to last June amounted altogether to about 40 per cent., those advances having been given in a prosperous time of trade, when the price of coal was advancing. In June last year there was a reduction made in the price of coal, and a reduction was made in wages to the amount of something like 15 per cent. or thereabouts. After that there was a still further reduction in the price of a portion of the coal, and a reduction in wages was given notice of corresponding to such an advance as had been given at the previous time for a corresponding advance in the price of coals. But they did not seem quite to see the thing in the light that I did. They thought there ought to have been a general reduction in the price of coal before that reduction in the wages was carried out. But the advance that was taken off was an advance given at their request when there was an advance only on the selling price of a certain portion of the coal, and that was explained to their delegates who came to me.

13,662. You say, "their delegates"—Do you refer to delegates of the union?—No, not of the union, their own deputation. They issued a circular stating their view and the reasons why the reduction ought not to have been made. As soon as I saw their circular I wrote a circular in reply, and I called a meeting of the men, and I read my reply over to the meeting, and I asked them (there was nothing in this which I read to them excepting what I had told the deputation) if their deputation had told them all those things; and on their replying in the negative, I said, "It appears "to me that your deputation is not much to be re- "lied upon; and in future I shall deal with no deputa- "tion, but with you yourselves. My answer to you "yourselves is this—I give you the option of going to "work upon the reduction, or I will leave the matter "to any fair arbitration." They said that they would like to have two or three days to consider about it, and at the end of three days they went to work.

13,663. Then you have had no direct communication with any delegates belonging to the union?—No, none at all, only with our own men.

13,664. (*Lord Elcho.*) Have you ever had any communication with delegates from the union? I mean you yourself personally?—No, but our men were in constant communication with the Ashton union.

13,665. You said, some time ago, in answer to a question put to you by Lord Lichfield, that you preferred meeting the men in a body to meeting deputations from them. Why was that? Did you find it more difficult to deal with deputations?—I always have found it best to deal with the whole body of the men. I have had very few occasions on which it has been necessary to meet our men at Poynton since I have been there, but two or three times I have had deputations, and two or three times I have had the whole body of the men, and I have been a little in hesitation as to the best plan. At one time I had a great aversion to meeting a body of men, but now I have got over that, and at that time I thought that I could rather deal with the men through their representatives than as a mass. I have tried both ways, but I have come to the conclusion that the best way for the master to deal with the men is to deal with them as a body.

13,666. What is the objection you find to dealing with individuals?—That they misrepresent things.

13,667. Your objection is that the representatives do not take back to the body whom they represent a fair account of what has passed between you and them?—That is my experience.

13,668. Is that which you say is not a fair account purposely given unfairly, or is it that they do not quite understand what has passed between you and them?—I used to be of opinion that it was because they did not understand what passed between us; but this last instance clearly showed me that they intentionally suppressed what I wished them to tell the workmen.

13,669. At what period of the strike did that interview take place?—At the commencement.

13,670. And you think that if there had been a fair representation of what your intentions were, the strike would not have been continued?—I think so. Of course it would not be quite fair to give as a reason for that opinion that when I did meet the men they did go to work, because it might be said that they were tired of fighting then; but I believe that if I had met the body of men first, instead of the deputation, the strike would not have lasted a week.

13,671. These men who carried back, as your impression is, a purposely unfair account, were those who came on the part of your own men, some might be unionists and some not I suppose?—I believe that at that time they were nearly all unionists.

13,672. At that time you were dealing then with the representatives of a union practically?—Yes.

13,673. You say that they gave an unfair representation of what passed between you, and you think that they did so purposely? What was their object do you suppose?—I can only suppose that they did it for the purpose of continuing the strike for one thing, and perhaps for mischief. I think the probability is that this may be the true state of the case: they had been appointed as representatives of the men; they had been probably leading the men to suppose that if they continued the strike they would gain their object, and they did not like to give the men ground for supposing that their advice had been bad advice.

13,674. (*Earl of Lichfield.*) In what respect did they misrepresent?—They concealed what I had said —they did not say what I had said; it was a misrepresentation by omission.

Mr. G. C. Greenwell.

31 March 1868.

13,675. (*Mr. Booth.*) May it not be the case also that men coming as representatives of others, and as advocates for others, may feel bound to insist with some degree of pertinacity upon their rights, and may be less open to any reasons that you may have to offer them than the body of the men would be?—Yes; that may be so.

13,676. So that the body of the men might have yielded to your reasons when the advocates did not feel at liberty to do so?—Yes, perhaps.

13,677. These men have a sort of *amour propre* in the whole matter, and did not like to go to the men and admit that they had given bad advice?

13,678. (*Earl of Lichfield.*) What did they omit to tell the men?—They did not explain to the men the grounds of the reduction.

13,679. (*Lord Elcho.*) You said although as a rule you did not think that unions affected the rate of wages, still they exercised, you thought, this influence, that in prosperous times they hastened a rise?—Yes, I think so.

13,680. Do you think that in unprosperous times, if one may use that word, that is to say in bad times, they equally check a fall?—I think they do, something in the same way.

13,681. Assuming that they do both, that they hasten a rise, and that they check a fall, and that so far they are sometimes successful, yet they very often fail in both, do they not?—Yes.

13,682. Assuming that occasionally they are successful in both, occasionally they fail in both?—Yes.

13,683. Occasionally they are accompanied by strikes?—Yes.

13,684. Where they are accompanied by strikes, whether they succeed or fail, their is a considerable amount of suffering and distress?—Yes.

13,685. Do you believe that setting the success against the failure, accompanied as they both are by these circumstances of distress, upon the whole the unions are beneficial to the working men as regards the question of wages and wages alone?—I believe as a matter of pounds, shillings, and pence, that they are most detrimental to the working men.

13,686. You believe that if there were a long debtor and creditor account made out since there have been unions, as a question of wages only the account would be very much against the benefit of the unions?—Very much against them.

13,687. (*Mr. Merivale.*) Do you believe that on the whole the men would be better off if they had never struck at all?—I believe that the men would be better off if they had never struck at all, no question about it.

13,688. (*Lord Elcho.*) There are other questions, are there not, in which unions take an active interest, such as the employment of women in mines, and such as the employment of children, such as the hours of labour, and such as weighing and those things?—Yes, I have seen a great deal about that.

13,689. There have been considerable changes introduced in all those circumstances, have there not?—As regards the employment of women I do not know that the prevention of that was the result of any union action on the part of the men. As to the weighing of the coals again, I am not perfectly clear that there has been anything decided done on account of any action of unions.

13,690. There has recently been a committee sitting on the employment of children, has there not, to consider the ages at which they should be employed, and the nature of their employment, and also the weighing at the pit's mouth?—Yes, but I am not aware that there has been any legislation on the point.

13,691. There has been a committee, and that committee has reported, perhaps you are aware?—I did not know that.

13,692. Are you aware that action in that matter by the miners was taken at the instance of the union, or some body of men that might be said to represent them in the union?—I do not know the fact; it is possible that it may be so, and personally I believe it was.

13,693. So that the action of the unions may have been beneficial in that respect?—Supposing that that which they gave in evidence before the Select Committee is carried out by Parliament, as they wish it, then I should consider that the union men have been doing something.

13,694. Take the subject of the employment of women in pits, do not you think it is a good thing that women are excluded from pits?—I think so.

13,695. And supposing it were shown before this Commission that that movement, in regard to the exclusion of women from pits, had originated with unions, you would admit then that in that respect the unions had acted beneficially?—Yes; decidedly so.

13,696. (*Mr. Hughes.*) You say you are not sure that this movement came from the unions. Did it come from the masters?—No; I think not. I believe it came from the unions.

13,697. Did not many of the masters oppose it?—That I do not know.

13,698. (*Lord Elcho.*) What do you say on the question of employing women at the pit's mouth?—I have seen women employed at the pit's mouth, and I do not very much like to see them employed at the pit's mouth; but I do not know that there is any good reason why they should not be.

13,699. (*Earl of Lichfield.*) Are women employed at the pit's mouth at the Poynton Collieries?—No; they are employed at the pit's mouth in Lancashire, but not in Cheshire.

13,700. At what age are boys employed by you?—None under 12 years of age are employed by us at Poynton.

13,701. (*Mr. Booth.*) Do you see any objection to women being employed in that way if it does not interfere with their home duties?—No.

13,702. (*Earl of Lichfield.*) Do you know any instances where unions have interfered to require greater precautions for the safety of the workers in the pit?—I do not know of any case.

13,703. (*Lord Elcho.*) With regard to weighing, there was a weighing clause introduced, was there not, in 1860?—I do not think it is compulsory.

13,704. (*Mr. Harrison.*) Surely it is compulsory if it is demanded?—If it is demanded, perhaps it is.

13,705. The men have a right to appoint a weighman if they elect him?—I think, if I recollect right, it is weighing or some system of measuring by some fixed standard that the Act prescribes.

13,706. (*Lord Elcho.*) We will take another branch of the subject, namely, the ventilation of mines and accidents in mines. There have been frequent movements in reference to that in Parliament. Are you aware whether in that matter action has or has not been taken by unions?—At the time of the renewal of the Inspection Acts I think there has been something done.

13,707. You cannot speak as to whether these unions, or the representatives of these unions, have or have not for a course of years taken an active part in bringing these questions before Government, and whether we may assume from that that legislation to a great extent has been due to that?—Whenever there has been a select committee on the point they have always given evidence on it, and I have no doubt that when evidence has been given it has been fairly considered.

13,708. With regard to these select committees, and this action on the part of the legislature, do not you think it might be shown perhaps that that had resulted in a great measure from the action of the men themselves?—It may be so, but it must be necessarily a mere matter of opinion because one cannot tell what reasons members of Parliament have for arriving at certain conclusions. There is certain evidence one reads, and that evidence was given with a certain intention, and that evidence had reference to questions of safety, no doubt, but how far that may have entered into the minds of the committee in making certain recommendations of course one does not know.

13,709. (*Earl of Lichfield.*) Have any cases of in-

timidation come under your notice in connexion with these strikes?—I think that that case which I mentioned at Marley Hill of the blowing up of the boilers and the turning of the waggons off the railway (and there were one or two cases of sending gunpowder down chimneys), were cases in point.

13,710. You have had no case of that sort at the Poynton Colliery?—No.

13,711. You have had no difficulty in the strike there?—No, except that it has been a strike, the mildest one that I ever knew.

13,712. The men I suppose are regularly employed at that colliery?—Yes.

13,713. Is there any accident fund or sick fund connected with that colliery?—An accident fund and several benefit societies as well.

Mr. G. C. Greenwell.

31 March 1868.

13,714. And are the men compelled to contribute to them?—It is an understanding that they join the accident fund, but so far as the benefit societies are concerned it is entirely optional on their part. As far as the accident fund goes they would not like not to subscribe to it.

13,715. How much do they subscribe?—They subscribe 4*d.* a fortnight. They used to subscribe 5*d.* in one fortnight and 4*d.* in the other, but a year and a half ago I thought that the funds were in a condition to allow it to be 4*d.* each fortnight instead of 4*d.* and 5*d.*

The witness withdrew.

Mr. Thomas Henshaw examined.

Mr. T. Henshaw.

13,716. (*Chairman.*) I believe that you have been a collier nearly all your working time, and that you have been at Staveley for eight years past?—Yes.

13,717. Do you remember the Ere-wash valley strike of 1844?—Yes.

13,718. Were you one of the men that went out in that strike?—Yes.

13,719. How long did you stop out?—Between two and three months.

13,720. You were in the union, I think, before the strike began. How long had you been a member?—About a fortnight.

13,721. When the strike began did you expect to have an allowance for the time that you were out of work?—Yes; delegates that came to the district promised us that we should have an allowance.

13,722. Could you get any?—No.

13,723. Not during the three or four months?—I never had a farthing.

13,724. You applied for it, of course? What answer did you get?—They kept saying that if I would come on Monday morning I should have it; but on Monday morning the money never came.

13,725. When you came on Monday there was no money forthcoming?—No.

13,726. Was there any story that some money had been carried away?—Yes, it was supposed to have been carried away by one of these delegates that used to lecture at the different market towns, he has never worked since.

13,727. That was in 1844. In 1857 was there another strike?—Yes.

13,728. Where were you working then?—I was working under the Wingerworth Company.

13,729. Did delegates come there?—Yes, some delegates came from Yorkshire and persuaded us to form a union. I had a good deal of talk with one of the delegates who appeared to be the most intelligent, and I asked him about what they were getting in Yorkshire, and how they got the coal, and so on, and I showed him that I was doing better without a union than they were doing with a union in Yorkshire; he told me that we were a great deal better off than they were, and he advised me to go on with my work; the delegates called a meeting and I went to the meeting at night, and they chose me to be on the committee, and as I was in a room full of men I did not like to object to have my name put down, but I did not mean to have anything to do with the union; it was then talked about, and it was told to my masters that I would join the union.

13,730. You did allow your name to be put down?—Yes, I had not joined the union, I had had my name put down, but I never paid any money? so I was left to go on with the work. There were many of them that had notice and some got turned off, and then it broke up. I tried all I could to persuade men to have nothing to do with it.

13,731. That attempt to form a union failed altogether, did it not?—Yes, it failed.

13,732. There was another attempt to form a union in 1864, I believe?—Yes; I was at Staveley at that time.

13,733. Did delegates come and speak in favour of the union?—Yes.

13,734. And did any of your men join?—Yes, there were a good many joined; about 200 from different collieries at Staveley, and those that joined paid 1*s.* a piece, and we send our delegates down into Yorkshire for them to bring a report of the system on which they carried on the union there, and to know whether they would be agreeable for the Staveley colliers to join that union, and they support us in case of strike. So they went and they came back again, and they paid their expenses out of the same money that was subscribed. When they brought their report the masters got to know that we had started this union, and they gave many men notice, and some they turned off; and one of the men was turned off for going into Yorkshire to bring these reports back, and as he had no money to go away with I told this man that we had better draw this bit of money at the public-house where we had met. So I sent him up to the public-house and told the landlord we had come up to draw the 6*l.* (he had about 6*l.*); the landlord handed us over the money and we gave Jonas Simmonds the delegate 35*s.*, part of the rest we gave back to the subscribers, and part we spent in drink.

13,735. That was the man that had been for you into Yorkshire and was turned off, to whom you gave this 35*s.*?—Yes.

13,736. I believe as far as you could advise the men you have advised the men against joining the union?—Yes, I have.

13,737. Have you had any other attempts to set up a union in your neighbourhood?—Yes; in 1866 there was a great attempt to start a union in our neighbourhood, and a great many joined as far as I could understand. I never went to any of these union meetings, but I was acquainted with many others who did. These delegates had put these men on to try to win me over to join the union. It was given out that there was going to be a great demonstration at Staveley; we had union for breakfast every morning, and the same for supper; they could talk about nothing else. I told them it would come to nought.

13,738. Then it did not succeed, as far as I understand from the paper of your evidence that has been put into my hand?—No; but they told me that I had a deal better join the union, and that those who joined were going to have 8*s.* a day for eight hours; great misery and distress was brought upon the men and their families by the attempt to form this last union, and I believe that if the men had come to the masters and discussed any grievances they thought they had, the masters would have listened to them and they might have settled their affairs better than Brown or any other of the delegates.

13,739. (*Lord Elcho.*) Is Brown a very fine speaker?—I never heard him. I told them that if they had 8*s.* for eight hours I should have a fine lot of money, because I knew that I could do as much again in a day as they did. I said that they could not afford to pay such men such a lot of money. They went on in this way for a while, and as far as I understand Brown had been fetched into the neighbourhood, and

Mr. T. Henshaw.

31 March 1868.

he knew no more about the system of hard work in the pit than this table, and after he had been going up and down the country it dropped to 4*s.* and 5*s.* 6*d.* So I got the men that did not join the union and I told them that if this system were allowed to go on they would ruin all this part of the country. So we agreed to form ourselves into a non-unionist society, as it was called, and I was one of the lecturers, and I told the master that I would not work for 4*s.* 6*d.* or 5*s.* or 5*s.* 6*d.*, and I would not. And I told him that if I could get more money anywhere else I would not stop there another day. By these meetings, and talking with men in the pit and as we went to work backwards and forwards, we succeeded in persuading many that had joined the union to give the union up, because they were clamming (that is, starving), and some of the wives and children were going about barefooted and barelegged. We succeeded in persuading a lot of the men that had joined it not to belong to it. Then the masters took a very wise view of the subject. They simply gave all the men notice, that they could either leave the work, or else come out of the union and go on with the work. The pits were full of men directly.

13,740. (*Chairman.*) You have worked as your own choice and your own inclination has guided you?—Yes.

13,741. And you think that that would be the best plan for the body of workmen?—Yes.

13,742. (*Lord Elcho.*) As to the benefit fund, it is the fact, is it not, that a certain sum is deducted from the wages at the Staveley Works, which forms a benefit fund?—Yes.

13,743. That is done with the full consent and knowledge of all concerned, is it not?—Yes.

13,744. Do you consider that a good plan?—I do.

13,745. And it works well?—Yes.

13,746. Have the men a control over that fund?—Yes.

13,747. How have they that control?—They have the control in either raising the fee or lowering it.

13,748. How do they do that, through whom?—A certain number of the workmen who form the committee, and the managing director, and the other gentlemen of the firm.

13,749. As I understand from what I have heard, the committee consists of the manager, certain headmen in certain departments, and certain other representatives who are elected from the different pits by ballot; is that so?—Yes.

13,750. And that committee has a complete management of this fund?—Yes.

13,751. With the full knowledge of all the subscribers, they are satisfied with the formation of the committee as to management?—I never heard a complaint.

13,752. Have the subscribers, or those whose money is taken to form this fund, a full knowledge of the sums so taken, the total amount, and how it is expended?—There is a notice put up on every pit bank every month.

13,753. Every month there is a notice put up, signed by whom?—The committee-men, of what money is paid out and what is paid in.

13,754. As to these elected members, how often are they elected, annually or monthly?—I think annually.

13,755. There has been no public question ever raised among the workmen of the pit as to whether this fund was or was not properly applied?—I have not heard a word of complaint.

13,756. You have heard no complaint of there being any secresy in the management of it?—I do not see how there can be any secresy where there is a notice every month.

13,757. (*Mr. Hughes.*) You say that a committee has the management of this fund; the committee is composed of how many of the employers?—I think there are nine of the workmen. I have been on the committee; I think it is nine.

13,758. And nine of the others?—I do not know how that is.

13,759. The seventh rule says that "The affairs of "this club shall be conducted by a managing com- "mittee, and shall consist of the colliery viewer, "secretary of the company, foundry manager, super- "intendent of works, accountant, foreman fitter, assis- "tant viewer, surveyor, and foundry foreman;" those "are all the officers?—Yes.

13,760. Who is their chairman?—Mr. Markham sometimes, and sometimes others.

13,761. But Mr. Markham is a member of the committee besides those nine officers?—Yes.

13,762. That gives him a majority, I suppose?—Yes, I suppose it does.

13,763. Supposing you want to alter a rule, how can you alter it?—Very likely there would not be any difference of opinion about the rule; it would go by vote.

13,764. You say you never heard of any complaint?—No.

13,765. Was not there a complaint made about the doctor?—That was before this accident fund started.

13,766. There was a sick fund then?—Yes.

13,767. What was their complaint about the doctor?—I do not know; I cannot remember to tell you.

13,768. You do not remember that dispute?—There were several disputes. They all fell to the ground.

13,769. How do you mean "fell to the ground"? Did not the men complain that they had not the doctor they wanted?—Some said that they had not.

13,770. Did they mention it to Mr. Markham?—Yes.

13,771. What did Mr. Markham say?—He said that they might have any doctor they liked.

13,772. Did he change the doctor?—It went by a vote through the colliery. Another doctor was proposed, and it went by the vote; and the men who wanted to change the doctor lost; and the man whom they employed for the doctor under those circumstances has brought another man in partnership with him into the neighbourhood, and so we have three doctors now where there were but two before.

13,773. So that you consider in fact you have quite as much your own way as you ought to have?—Yes.

13,774. When you started this non-unionist society what were your objects in starting it?—I thought that if we allowed Brown to go on with his doctrine in the neighbourhood we should have to work for about half of the money that we were working for.

13,775. And so you thought that you would establish a union to keep the wages up?—No; it was not a union.

13,776. What was it? It was a non-unionist union I suppose?—That was what the public had a mind to call it.

13,777. What did you call it?—A free labour society. We wanted nothing but liberty and freedom of labour.

13,778. But you said just now that you would have opposed any reduction of wages in that society?—Yes; there was not a proposal to reduce the wages, only when the union delegates were preaching in the neighbourhood.

13,779. But supposing there had been a proposition to your non-unionist society to reduce wages, you would have thought it right to take any step you could to keep them as they were?—We would have advised and consulted with them on the subject.

13,780. You said you would have left your work?—I would if I could have got better wages.

13,781. And you thought the non-unionist society would be right in supporting the men?—There was nothing to support them with.

13,782. But when you established a non-unionist society, you did not mean to establish it for nothing?—The public called it that; but we called it a free labour society.

13,783. When you established a free labour society,

you meant to have some subscription, I suppose ?—No.

13,784. Who did you mean to pay for it ?—We did it for the good of the public. We had not a farthing from them. I was working regularly, and did not want anybody to pay me.

13,785. What you did was to establish a free labour society ?—Yes.

13,786. Who paid the expenses ?—No one paid any expenses at all ; everybody his own.

13,787. It was hardly a society, was it ? Had you any rules ?—We had no rules, we went by word of mouth ; there was no contribution whatever.

13,788. There was no contribution, and there were no rules ?—No.

13,789. So in fact it was no society ?—It was what the public had a mind to call it, they called it a non-unionist society, and we called it the Free Labour Society.

13,790. In fact if you had left your work because you thought you could get work better elsewhere, that society would not have helped you ?—I did not want any help.

13,791. (*Mr. Harrison.*) You have been a member of the union yourself in former days ?—Yes.

13,792. Have you ever held office ?—Yes.

13,793. What office ?—I was one of the committee.

13,794. Were you ever treasurer ?—No ; I should have kept the funds myself if I had been.

13,795. Did you ever say that in public ?—No.

13,796. You never made a speech in which you said you had actually done so ?—No, I never made a speech to that effect.

13,797. You were present, were you not, at the dinner with which the establishment of the free labour association was begun ?—Oh no, there was no dinner given on that account.

13,798. On what account was the dinner given ?—There was a dinner given because we said the whole country round was clamming. The delegates promised them all round that they should have this money, and the whole of the country was in a bad state, and we begged a bullock of the master and some drink, and we all had it that had a mind to eat it. what were called the union men had it, but I had a good dinner at home.

13,799. As a matter of fact the company found a bullock and barrels of beer, and there was a great feast ?—A little oratorio, and we broke the union up.

13,800. There was a good deal of intoxication I suppose ?—I never saw anybody intoxicated, they had not enough for that.

13,801. Let us know more about this dinner ; you seem to connect the breaking up of the union with the dinner, just tell us how that is ?—300 or 400 men that had been sticking to the union, and who were going with empty stomachs, when they saw this beef were ready to swallow it whole if they could, and they all flocked in and had a share of it, and went to work the next morning.

13,802. And you think the dinner had something to do with the breaking up of the union ?—It had a good effect I think.

13,803. Were there any special allowances or advances made at the time to the men who consented to give up the union ?—No, not that I know of.

13,804. Not an advance, or an allowance equivalent to it ?—I never heard anything of the kind.

13,805. What place do you hold now ? Are you a manager of any kind ?—Yes, I am manager of a stall ; there are two of us, and I am one.

13,806. (*Earl of Lichfield.*) Will you describe that a little more fully ?—The stall-men take the charge of a job. There are some stalls 40 yards long, some 50, and others 90 or 100. They let it out to men. They have charge of the place, and as to all men that work under them, they are responsible in a certain degree to make them safe because the inferior class of men, many of them are not capable of making the places safe, and we work for ourselves, although we have it by the ton price, by contract.

13,807. Do you pay those men ?—Yes, they have their work at so much a yard, and the loaders have it at so much a ton. We all work for ourselves, and try to do the best for ourselves ; but these stall men in general are considered the best class of men, because the others could not do the stallmen's work, and very often they could not do above three parts as much work.

13,808. (*Mr. Harrison.*) You contract to do a certain piece of work, and you hire men under you to do it for you ?—They come to work and have it on the yard price, and if they have done one yard they pay them one yard for it, and if they do 20 yards they are still paid.

13,809. They are not paid by the ton ?—No, the loaders are paid by the ton.

13,810. What do you pay the men immediately under you ?—I pay them what they can get.

13,811. How many men have you got under you ?—Three.

13,812. Did you pay the men last Saturday ?—Yes.

13,813. What did you pay them last Saturday ?—It is not my business to tell you. They, perhaps, would grumble. At the price I pay the men by the yard I can get 7*s.* 6*d.* a day comfortably.

13,814. I want to know what the man gets ?—I shall not tell you ; I never worked for less than 5*s.* I will tell you that.

13,815. I want to know what you pay the men under you ?—I shall not tell you that.

13,816. (*Mr. Booth.*) You would tell us how much a person would be able to earn at that work ?—I can get 7*s.* 6*d.* a day.

13,817. A person in a situation under you, a good workman, working diligently, could get as much as 7*s.* 6*d.* a day ?—There are some men that can get more than I can.

13,818. (*Mr. Merivale.*) How are your men paid who work by the day ?—When a man does a day's work for us we give 5*s.* 6*d.*, and some as much as 6*s.*

13,819. (*Mr. Harrison.*) What do you call that system in your part of the country, the butty system, is it not ?—No, the stall-worked system. The butty system is where a man has a pit, and all the other men are under him.

13,820. (*Mr. Hughes.*) You have had three sons in the union, I think ?—Yes.

13,821. Are they in the union still ?—One is not, because he is dead ; one is in the union. They gave him notice to leave when he joined the union, and I told him when he left home, when he left off working with his hands, he must give over eating with his mouth, so they sent him off, and he went and got a job elsewhere, and I got him a character from Mr. Campbell.

13,822. He is still in the union, is he ?—I do not know ; I never asked him the question.

13,823. You said that they tried to persuade you to go into the union, and you tried to persuade them to come out ?—Yes.

13,824. Neither side were successful ?—I thought I could do without it. Many of these delegates can persuade the men to live on the union.

13,825. Your sons are not delegates, are they ?—They said that one of them lectured a bit. I do not know whether he was.

13,826. (*Earl of Lichfield.*) How many of the men in the colliery belong to your free labour society ?—I think that we had a good deal towards a thousand. We had these men who took the names down, and when this bullock eating came I do not know then how many we had.

13,827. (*Mr. Hughes.*) I should think that you had them all then ?—I think we had.

13,828. (*Mr. Harrison.*) The Free Labour Association at Staveley really consisted of the managers entering the names of men off from the pay list ?—No, we did it ourselves.

13,829. The men did not put their names down voluntarily, did they ?—Yes they did, all of them ; we would not have them unless they did it voluntarily.

Mr. T. Henshaw.

31 March 1868.

13,830. (*Mr. Hughes.*) What did they expect to get by it?—To get nothing, only to work quiet, and free from delegates going round the country. We expected to get a fair day's wage for a fair day's work.

13,831. (*Mr. Merivale.*) I suppose when a man is known to belong to the free labour society he is not afraid of being troubled with delegates much?—I am not afraid of being troubled with them much.

13,832. (*Earl of Lichfield.*) How was it arranged that you came here to give evidence to-day?—We heard talk of this Trades' Union Commission, and I said I should like just to say a word to you about this union job.

13,833. To whom did you say that?—To the master I worked under.

13,834. To Mr. Markham?—No, I did not say so to him, but to the gaffer at the pit.

13,835. How did it come about that you came up here?—We read the reports in the newspapers.

13,836. Did you write up here?—No.

13,837. (*Mr. Hughes.*) It is pretty well known that you will break down the unions if you can, is it not?—I am telling you that I shall.

13,838. I suppose that is probably the reason that you were selected, is it not?—I do not know that it is.

13,389. It is known that you have been a leader on the other side?—I have not been a leader.

13,840. (*Mr. Harrison.*) Did not you present Mr. Markham with a testimonial on behalf of the men to celebrate this movement?—No; we presented him with a testimonial for assisting us in the freedom of our labour.

13,841. (*Earl of Lichfield.*) Had the men working in the pit with you anything to do with your coming up?—No.

13,842. Then you were selected by Mr. Markham to come and give evidence?—No, it was the gaffer at the pit.

13,843. At any rate you were selected by an overman, the men in the pit had nothing to do with it?—I do not know that any of them had anything to do with it.

13,844. (*Chairman.*) Did you say that the workmen had a voice in raising or lowering the pay in the accident fund?—Yes.

13,845. Have they any voice in fixing the amount of subscription paid?—As to the amount of subscription I do not think it will be altered, but in case a man is sick or lame he makes an application to some of the committee, and they make a report to the committee, and they make him a grant of something out of the fund towards bettering his circumstances.

13,846. That is to say that the workmen have a voice in the amount given to the man if he is sick or has had an accident?—Yes.

13,847. Not in the amount of subscription? The subscription is a given sum, 2*d.* a week, or whatever it is?—The allowance is 5*s.* a week from the accident fund, and 5*s.* a week from the sick fund.

13,848. (*Earl of Lichfield.*) Have you made the statement you have made here to anybody before you came up?—No.

13,849. (*Mr. Hughes.*) Did not you go and make it at the office of the company?—No.

13,850. (*Earl of Lichfield.*) I understood you just now to say you thought that Mr. Markham had acted very wisely in refusing to employ any union men in his colliery?—Yes, I do.

13,851. Is that the opinion of many of the men working in the colliery?—Yes.

13,852. A large proportion of them?—All that I talk with. There are plenty that I do not know and do not talk with, but all that I am acquainted with agree with me that we are better off and that they are able to raise our wages more without the union than with it.

13,853. But have the men at any time discussed among themselves the desirability of giving evidence before this Commission?—I have not heard them, only what I have dealt with.

13,854. But do not you think that it would have been more satisfactory if we had been able to feel that you represented the general feeling of the men in the pit, which you might have done if you had had any meeting on the subject?—I am sure they would have agreed for me to come.

13,855. (*Mr. Harrison.*) You are a sort of Brown of the anti-union movement. Do not you hold the same position as he does? You take the lead and make speeches?—I do not know that. I never took the lead. What I did I was put on to by the goodwill of the men who worked on the colliery, because those who know me know that I always wish a man to have a fair day's wage for a fair day's work.

13,856. (*Mr. Hughes.*) As to those 78 men who were dismissed when they joined the union, have you their goodwill?—I never consulted them to know whether I stood high in their estimation or not.

13,857. You opposed them as violently as you could?—Yes.

The witness withdrew.

Mr. E. Smith

Mr. Elijah Smith examined.

13,858. (*Chairman.*) You have been a collier at Staveley I think for seven years?—Yes.

13,859. Were you employed in 1844 at the time of the great strike?—I had just commenced as a boy to be employed.

13,860. How long were you out of employment at that strike?—24 weeks.

13,861. What was your age then?—I was just turned 10.

13,862. You were a boy working in the colliery, I suppose?—I had just commenced.

13,863. Was your father in the strike too?—Yes; he was in the strike. He had a house of his own, and through being in the strike 24 weeks he had to mortgage it. He mortgaged it for 80*l.*, and he never got over that while he lived.

13,864. Was that debt of 80*l.* brought upon him by the strike?—Yes, by the strike, he having a large family.

13,865. I do not understand how he came to a loss of 80*l.*?—There was a large family of us, 11 sons, big boys.

13,866. And they were all of them stopped from work?—Yes; there was no pay in 1844 from the union; they never received a farthing.

13,867. Why did he not receive anything from the union?—It was a failure. There were delegates who kept coming and saying there would be money coming this time and the other time, but there was never any that came. There was Mr. Roberts from Manchester; he came came down to some young men who got into trouble by intimidating a foreman of a colliery, and he lectured to them, and that day I was present, and money was to come the following Monday, but none did come.

13,868. Was there an attempt two years ago to establish a union at Staveley in 1866?—Yes; there was an attempt to establish a union at Clay Cross and Staveley.

13,869. Was there a large body of men that came across to your colliery or to your house?—They came and brought brick ends, and I do not know what, and I and my wife and three children sat by the fire, and they said I had no occasion to be out of the union (I was not compelled to be out) for I had a little money, and they thought that would stand me without pay from the union, and I had a right to join it; and therefore that night I was compelled to go up to the place where they held the meeting, and they proposed me for secretary, and I was obliged to take it. I could not resist it.

13,870. You agreed to be secretary that night, did you?—Yes.

13,871. What was the consequence of that on the part of your employers?—They gave me notice the following Saturday.

13,872. Upon that did you go out on strike?—Yes; 14 weeks I was out on strike.

13,873. What did you receive?—I received 8*s.* a week for some time; of that, with 6*s.* for incidental expenses, and 5*s.* a day for delegation to Chesterfield when we went (some days, not all the days); and then they agreed to give me 6*s.* in addition to that to commission the men to still stick to the union, and get them to pay in secret. I was to go round to the men's houses to collect the money, so that they might meet together in a body.

13,874. In going round during the strike did you see whether there was much distress occasioned by the strike?—Yes, there was. I myself found money for one, and I shall never get it back again, for he will never be able to give it to me. It was a 23*l.* loss to me in 14 weeks.

13,875. Since that have you had anything to do with unions at all?—Oh no.

13,876. Do you belong to the Free Labour Society?—I intend to belong to it. I did not wish to belong to the union. I wanted to keep out of it. I kept out of it from November until they came from Speedwell and forced us.

13,877. That is to say, a large body of men came?—Yes.

13,878. And you did not like to stand against them?—No.

13,879. They did not threaten violence, did they?—They threatened to smash my windows, and I have three children and a wife there, and they would have thrown brick ends in if I had objected to be a union man.

13,880. You gave your assent under those circumstances?—Yes.

13,881. And they appointed you secretary?—Yes.

13,882. And it was a loss to you of 23*l.*?—Yes.

13,883. (*Mr. Booth*). You were afraid to decline to undertake the office?—Yes, I dared not. What was I to do in a room full of men—all union men?

13,884. You felt persuaded, whether it was really the case or not, that some violence would follow?—Yes; I could not resist I am certain. I had to join or they would have bumped me well.

13,885. (*Earl of Lichfield.*) Do you take a contract and have men to work under you?—I have nobody to work under me. My contract is for myself.

13,886. (*Mr. Harrison.*) What are you?—I am a header.

13,887. (*Earl of Lichfield.*) Whom are you paid by?—I am paid by the company.

13,888. (*Chairman.*) What is a header's work?—Making roads for the people to walk on and for the tub to be brought to bank.

13,889. Have you opportunity to know what wages the colliers are getting at other collieries?—Yes.

13,890. Do you know whether yours are paid as much as the men in the unions in Yorkshire?—Yes, I know that I am paid as well as anyone in Yorkshire.

13,891. (*Mr. Harrison.*) You are paid by the day, are you not?—No, I am paid by contract; if I drive a yard I am paid so much.

13,892. You have nothing to do with the getting of the coal?—Yes.

18,893. Indirectly; but you are not paid for any coal you get, are you?—Yes, so much per ton, along with the yard price.

13,894. (*Mr. Hughes.*) You have so much per yard for driving the head, and so much for the coal you cut as well?—Yes.

13,895. (*Earl of Lichfield.*) How is it you have nobody under you, because the last witness told us that the work at the colliery was done by a contractor with two or three men under him?—In the stalls they have ordinary men under them. My work is the same as what theirs is in the stalls.

13,896. (*Mr. Hughes.*) In 1844 you were 10 years old?—Yes.

13,897. You were working in the colliery?—Yes, I began to work in the colliery then.

13,898. You were working in the colliery then at the time that that great strike took place in 1844?—Yes.

13,899. Supposing a great strike were to take place now, could boys of that age be working in the colliery?—They could not.

13,900. Why not?—Because it is prohibited by Act of Parliament.

13,901. Do you know how that Act was obtained?—No.

13,902. Did you ever hear that it was obtained by the influence of the union?—No, I never heard that it was obtained by any influence of any union.

13,903. Who do you think started the agitation which obtained that Act?—I do not know.

13,904. Are not your colliers interested in that matter?—It may be, but I have not been interested in it.

13,905. You do not care whether boys or girls work in collieries or not?—Such a case has not come under my knowledge since I have come out.

13,906. Do not you think it is a much better thing that they should not be employed at that early age?—Yes.

13,907. And supposing that anybody can prove to you that the unions had made that change you would think they had done a good thing for the trade?—That they had done a good thing for the population.

13,908. And for the colliers?—Certainly for the colliers.

13,909. (*Mr. Booth.*) Have you been concerned in any other strikes than those you have mentioned?—No.

13,910. Are the wages in the Staveley Colliery, where there is no union, generally higher or lower than in the neighbouring collieries where unions are prevalent?—I have found them better. I have been up in Yorshire a little bit, but I have had better remuneration at Staveley for my work than I have had at any other colliery I have ever worked at.

13,911. (*Mr. Hughes.*) Do you remember when the 78 men were sent away for being unionists?—Yes, I remember the talk of their being sent away, and receiving notice.

13,912. They were sent away by Mr. Markham?—Yes.

13,913. Did you tell Mr. Markham the names?—No.

13,914. How did he find it out?—I cannot tell how he found it out.

13,915. (*Earl of Lichfield.*) Do you find that the men who are working by contract under the stall managers (I think they call them) are equally satisfied with the wages they get there?—I have not heard any complaining about it, and I should think a man would be at liberty to complain where he makes his own contract; he must give notice if he wishes to leave his place and better himself.

13,916. (*Mr. Hughes.*) Did you show Mr. Markham any balance sheets or lists of the union while you were secretary?—No, I never had any communication with him until I went to get employment, and that was when the union had given over bringing pay; I did not get my pay; they did not pay the men, and there was a great deal of misery.

13,917. You said that you got 8*s.* a week for some time?—Yes, for some time, but not all of that time.

13,918. And you got 6*s.* extra for going round and collecting money?—Yes.

13,919. (*Mr. Harrison.*) Who sent you up here?—I saw a paragraph in the paper myself, and I thought that I should like to come up here. I discussed the thing with my employer, that is the foreman of the pit, I told him what I had seen, and that I should like to come.

13,920. He sent up an outline of your evidence I suppose?—Yes, we talked things over.

Mr. E. Smith.
31 March 1868.

13,921. (*Mr. Hughes.*) You never joined the union till this night they came to you?—No.

13,922. Did you pay any subscription to the union?—I had to pay the following Saturday when the contributions were taken.

13,923. At that time the strike had begun?—There were several parties that had had notice before.

13,924. How many weeks was it after that time before the strike broke out in your pit?—It had broken out for some time. As they found them out, they were locked out as they call it.

13,925. They sent away every man they found out?—Yes.

13,926. How many weeks did you pay your subscriptions before you were found out?—I did not pay one subscription before I was found out, and my master threatened me with notice as soon as he heard I was one.

13,927. You never paid anything to the union, did you?—I paid all along till I was locked out. The rule was this, that a person paid 1*s.* contribution, and I paid that till I left off work, and then it was 6*d.* a week.

13,928. And you got back 8*s.* a week for some time?—Yes, for some of the time I was out. I do not mean the whole time.

13,929. What was the name of the union?—They called it the union men uniting together as a body.

13,930. Did they call it the Staveley union?—They called it the Nottinghamshire and Derbyshire union.

13,931. (*Earl of Lichfield.*) Whom did you pay your contribution to?—I paid it to the person that was secretary up to the time of my being secretary. He had gone away and they proposed me.

13,932. You paid to the secretary of the Nottinghamshire union. Is that what I am to understand?—They had intimidated me into it, as I call it. They proposed me as secretary. My name was written down that night by the secretary that was going away. He was going away because he had got notice to leave from his employers, and that was the reason that they would propose me, and my name was set down by him, but I never paid to him, because he went away previous to my coming on to the lodge night, the night that they called the contributions together.

13,933. (*Mr. Hughes.*) Do you remember anything about that question of the doctor?—Yes, I remember the question.

13,934. Did not the men ask to have another doctor?—Yes.

13,935. Did they get it?—They wanted another doctor, and they have appointed another.

13,936. In the colliery do you mean?—Yes.

The witness withdrew.

Mr. George Whitworth examined.

Mr. G. Whitworth.

13,937. (*Chairman.*) I think you have been a collier nearly all your working time?—Yes.

13,938. And you have worked at Staveley 20 years?—Yes.

13,939. There was a great strike there, I believe, many years ago?—Yes, in 1844.

13,940. How long were you out?—About 26 weeks.

13,941. Did you get your pay from the union during that time?—I never got anything. I had a little bit of my own, and by begging and getting what I could it helped me out.

13,942. Did you spend all that you had saved before?—Yes.

13,943. How much was that?—It was somewhere about 20*l.*

13,944. You having got nothing did the strike succeed? Did the working men get what they wanted by the strike?—No, they did not.

13,945. What was it they wanted?—They wanted about 6*d.* a day increase at that time.

13,946. Have you tried the wages at different places in Yorkshire and Wales?—No, not in Yorkshire, but I have tried them about Dronfield.

13,947. You have worked chiefly at Staveley, have you not?—Yes, I went to Staveley and have stopped there ever since.

13,948. As far as you know have your wages at Staveley been as good as the wages of the men where the unions have been established?—Yes.

13,949. Was there a strike afterwards?—Yes, there has been this late strike.

13,950. When was that?—In 1866.

13,951. Was there violence threatened to the men who did not join that strike?—At this pit where I worked they all left except about 70 labourers and myself. I was the only pitman that stopped in the pit. There was not a strike at the other four or five pits, but this was a place called Springwell Pit, and the men gave notice and struck, and there was only myself left. I never was in the union and I never lost a day's work.

13,952. Did these men threaten you under those circumstances?—Yes, they did threaten me and my father-in-law also.

13,953. What did they threaten?—I built myself a house and they said that they would knock it down. And my father-in-law had a house that was thatched, and they said that they would set it on fire. My father-in-law had two pigs and they cut one up; they cut it straight down each side, and another down his back, and they both had to be killed. And I had a pig, and another man had got two, and he killed these two; but I said to myself, "I will catch them; "if the cat comes to catch the mouse I will see if I "cannot catch the cat." They got aware of that and they never came near me.

13,954. They used this violence, but you kept on your work during the whole time of the strike, did you not?—Yes.

13,955. After that strike was over did the men, as far as you know, gain what they wanted by that strike?—No, they did not, they got nothing but misery by that strike.

13,956. That was Mr. Brown's time when he came and addressed the men was it not?—Yes. I never saw Mr. Brown. I never went to one of his meetings. I determined not to have anything to do with him, but that I would manage my own affairs and leave other folk to manage theirs.

13,957. And you have as far as you know had as much profit as you could have got elsewhere?—Yes, and I think rather more.

13,958. (*Earl of Lichfield.*) I suppose you belong to the Free Labour Society?—I belong to none of them, I have attended to my work.

13,959. (*Mr. Harrison.*) You were selected and your name has been sent in to us from the office in which you are employed, you were not selected by the workmen at all as representing them, were you?—No, I wanted to tell you what I had to say about these pigs, and so forth.

13,960. You were selected by the manager of the company to come here?—I saw that advertised. I do not know about their selecting me.

13,961. The manager has informed us that you were selected?—I daresay I was sent by the manager.

13,962. He selected, he said, three of the most intelligent men in the works to give evidence and you among the rest. Are you employed in any way under or in the same pit with Mr. Campbell, who is at present the viewer?—Well, he is the head viewer over it, then he has managers under him.

13,963. He is in the same pit in which you are?—He is at one of the pits.

13,964. You do not know whether it is a fact that the company has requested that Mr. Campbell should be present whilst you gave your evidence?—It might be so, no matter whether it is or not, it is truth that I speak.

13,965. (*Earl of Lichfield.*) At any rate, whoever sent you, I suppose that you are come here to give us an honest opinion on the subject?—Yes.

13,966. Are you a contractor in the colliery; have you men working under you?—Yes, one.

13,967. You pay him, do you not?—Yes.

13,968. He is not paid by the company?—No.

13,969. Have the company anything whatever to do with the wages of the one man you have under you?—The company gives a man say, a labouring man, not a pitman, so much.

13,970. It is optional with you to pay that man what you choose?—No, not less than what the company give them, but they will allow us to give more. The company give such an amount of wages to their labourers, so much a day, and they do not allow us to give them less, but we may give them more if we think proper.

13,971. What is the least they allow you to give?—They give 4*s.*

13,972. 4*s.* a day?—Yes, for a labourer; but then they do not allow us to give any less than they give.

13,973. Do you give your man the minimum price?—I give my man that works with me 4*s.* 2*d.*, and I pay for his club besides, and find him candles.

13,974. (*Mr. Hughes.*) Is there any difference of opinion in the Staveley colliery amongst the men as to the benefit of unions or not?—Well they never benefited me at all.

13,975. Is there any difference of opinion in the colliery; do you think there are any men that still think the unions beneficial?—I can tell you they were all very glad to come back and work at the same price they left it at.

13,976. You do not think that there is any such division of opinion?—I do not discuss with them very much.

13,977. At any rate you three persons who have been here to-day, Henshaw, Smith, and Whitworth, represent the men who disbelieve in unions altogether?—I disbelieve in them; I have nothing to do with them.

13,978. But you represent in fact the same opinions as the owners of the colliery?—I am of that opinion that I have told you; if I had not been of that opinion I should have been in the union the same as the rest of them.

13,979. If there be any persons employed at the Staveley colliery who still think the unions a beneficial thing for the workmen, they are not represented here?—I can tell you what the unions have done at Staveley.

13,980. I know what the unions have done at Staveley. The men who take the other view are not represented, in fact all who have been here to-day represented exactly the same opinion as the owners?—I am of my own opinion; I do not know what opinion the owners represent.

13,981. Mr. Markham selected you to come up here and give evidence?—And I have given evidence.

13,982. I only say you do not represent all the men?—I believe all the men are very well satisfied and getting good wages.

13,983. You represent a certain number of them only?—I cannot represent every man's mind.

13,984. You do not represent in any way, do you, the opinion of the men in the colliery? You have your own strong opinion which entirely coincides with the owners; you cannot see any good in the union at all in fact?—I cannot.

The witness withdrew.

Adjourned to Tuesday the 22d April, at 11 o'clock.

CLUB
PALL MALL

APPENDIX.

Memorandum drawn up by Mr. Alexander Glen Finlaison, Actuary to the National Debt Office.*

National Debt Office,
Sir, Sept. 25, 1867.

In conformity with the desire of the Trades Union Commission that I should examine the several rules and reports of the "Amalgamated Society of Engineers," &c., and of the "Amalgamated Society of Carpenters and Joiners," and advise the Commissioners as to my opinion of the pecuniary soundness, or the contrary, of the institutions to which these documents respectively apply, I beg leave to submit the following statement of the views which I entertain of the condition and regulations of the associations in question, and of the prospects which in my judgment they severally have of permanently being in a situation to fulfil their various engagements.

The position, in a pecuniary aspect, of the Amalgamated Society of Carpenters and Joiners having already been subjected to professional examination, I have proceeded to deal, first in order, with the condition of the Amalgamated Society of Engineers, and I find that at the close of the year 1866, the date of the last report of the general secretary of the society, the association was composed of 33,007 members. It possessed at the period just mentioned a capital of 138,113*l.*, exclusive of a sum of 10,068*l.* arrears of contribution, &c., then due to the fund.

The principal rules of the society are to the following effect:—

Admission at any age from 21 to 40 years.

Evidence as to age, character, and health is required. If certified as unfit for admission to the sickness benefit, the member may join nevertheless, on contributing for all the other benefits, at a somewhat lower rate of subscription. No deaf and dumb, or cripple, or maimed, or subject to fits, or deprived of one eye, being above 30, is admissible.

The contributions are as follows:—An entrance fee ranging from 15*s.* to 50*s.*, and a weekly subscription of 1*s.*

The contributions are payable for the benefits held out by the rules, *and such other objects as the rules contemplate.*

Members are likewise subject to levies. But no levy can be enforced unless carried by a majority of votes.

Members are exempt from payment of contributions and levies during their receipt of benefit.

The benefits consist of weekly allowances in sickness; pensions in old age; sums at death; and liberal compensation in case of accident, or loss of limb, or loss of faculties. A small sum in case of loss of tools by fire is also assured; and further, weekly donations while out of employment.

The sickness benefit is 10*s.* per week for 26 weeks, and 5*s.* per week for the remainder of the sickness. All claims to this allowance cease when the pension in superannuation commences. The pension in superannuation consists of a weekly allowance for life when the member has been in the society—

30 years, of 9*s.* per week, or 23*l.* 8*s.* per annum,
or 25 years, of 8*s.* „ or 20*l.* 16*s.* „
or 18 years successively of 7*s.*, or 18*l.* 4*s.* „

The stipulation that the member shall have been successively 25 or 30 years in the society being omitted in respect of the two higher amounts of pension.

The sums payable on death are 12*l.* on the death of a member, or 5*l.* at the death of a member's wife, in which case and at the subsequent death of the member the balance of 7*l.* only is payable.

The compensation in case of accident entailing loss of limb or in other severe afflictions such as blindness, paralysis, epilepsy, &c., is to the very liberal extent of 100*l.* It would at first seem to be a compulsory commutation of all the other benefits in cases where the member has not been in the society 18 years, or has not attained the age of 50. But the third section of rule 23 states that "Any member having received "the benefit of this rule and who is entitled to benefit "in case of sickness, may continue to be entitled to "sick and funeral benefit by paying contribution at the "rate of 6*d.* per week. No member to receive benefit "for the same complaint which entitled him to the "100*l.*" As no period is stated in this rule for the cessation of the right to claim sickness allowance, it is possible that the benefit may be permitted to continue for life. The acceptance of the 100*l.* clearly extinguishes the claim to superannuation. But the denial of this benefit, which, in ordinary cases, puts an end to the receipt of sickness allowance, would seem by implication to give permanence to the claim to allowance in sickness. Under any circumstances the provisions of this rule make an important addendum to the normal risk of claims for sickness likely to arise from among the members at large, because the composition leaves a class of contributors with acknowleged damaged constitutions, assured for the benefit, and this too at a very low rate of contribution.

The liability for assurance against fire is comparatively so small in extent that it may safely be allowed to escape consideration in the presence of far heavier risks.

But there is one other item of expenditure which is of much importance. This is the annual outgoing for donations to members out of employment. The disbursements under this head transcend in amount any one of the other charges; and on the average of the last five years has pressed on the resources of the fund with nearly double the weight of the demands for allowances in sickness. Under this head, there is allowed to the member while out of employment—

10*s.* per week for 14 weeks,
7*s.* „ for 30 do.
6*s.* „ for 8 do.

or within 2*s.* of 20*l.* for the 52 weeks of the year.

And in this channel during the last five years has been expended 125,046*l.* The outgoing for sickness allowances during the same period has been 64,538*l.*

The above summary of the benefits guaranteed suggests the reflection that the engagements entered into by the Amalgamated Society of Engineers are onerous; in consideration of a contribution of 52*s.* a year.

But the fund relies upon two important resources not always taken into account in benefit clubs. It relies in some measure, it is said, upon the faculty of levying extra contributions; but it relies also in a much greater degree upon the non-appearance at a future period of the bulk of its present contributors; in other words upon secession

The rule concerning levies is not very clear or decisive. It states that the council may consult the

* The oral evidence given by Mr. Finlaison, previous to the drawing up of this Memorandum, will be found at p. 79 of the Fourth Report of the Commissioners.

members on the propriety of raising a contingent fund, a benevolent fund, or a fund for granting assistance to other trades. But no levies are to be enforced unless carried by a majority of votes. Again, a large class of members is exempt from payment of levies.

It is not apparent that, under the above rule, levies can be made expressly for the purpose of supplementing deficient contributions unless the provision for a contingent fund may be interpreted to be applicable, if necessary, to this object. But, in any event, for a levy the consent of a majority is indispensable, and the reluctance to self-taxation is proverbial. There is no trace in the annual receipts of the society of any recourse to the practice. Even admitting that it might be overcome on a few occasions, there is a strong probability that a persistence in the infliction of levies would speedily bring about a break-up of the society, through the inducement given to the younger members to form new associations and to leave the old and chargeable members to shift for themselves. From a dread of this result permanent reliance can never be placed on a system of levies raised in aid of insufficient regular contributions.

The safeguard principally relied upon is secession. Much stress is laid, and very fairly so, upon the influence which this auxiliary will probably have on the claims to benefit.

There is no reason to doubt that the influence of secession has always had a powerful effect on the affairs of benefit clubs. In the statistics supplied by the returns from the friendly societies of England and Wales it has been perceived that the outflow of secession prevails to an extent and takes place with such constancy as to assume all the features of a law. In small clubs, with their limited transactions, there may be grounds for refusing to take it into account, through fear of oscillation and abnormal effects arising out of a casual operation of the principle. But in large associations there does not seem to be any reason to fear that the effect of secession will not always be felt with perfect regularity, nor that a certain but considerable per-centage of the members will not annually disappear from causes independent of removal by death. Caprice, displeasure, or distaste will have some weight; retirement, by reason of removal to remote places of employment, or expulsion for contravention of rules, or for other reasons, will bring about withdrawal. But there is one cause, greatest of all, which will assert its predominance, namely, inability to keep up the necessary payments. Each and all of the above forces act, for obvious reasons, with the greatest power at the younger ages; and, although the ratio of their combined effect diminishes with advancing age, it does not quickly disappear, but continues to exert an influence up to the period when the benefit of a provision for old age generally commences.

The question then arises as to the degree of force and regularity with which the probability of secession will come into play.

A reference to the digest of returns relating to friendly societies in England and Wales, published by order of the House of Commons in 1853 (Parl. Paper, No. 955), will supply information of the per-centage of secession that takes place at each age among the contributors to benefit clubs.

There is much reason to surmise that a very large proportion of those who secede from their clubs rejoin them at an early opportunity. The expediency of such a course makes its pursuit more than probable. It is in evidence that this is also the belief of the general manager of the Amalgamated Society of Carpenters and Joiners; for he deposes that it is a common occurrence in all trade societies for the members to rejoin three and four times over. Under these circumstances, one individual perhaps having supplied two or three examples of desertion, the actual nett permanent secession will be much less than that which is set down in the gross. In many instances, again, there are placed to the account of secession cases in which the candidate has abstained from qualifying himself for admission by payment of his entrance fee, and not seldom the candidate is found to labour under disqualifications which by the rules of the society rendered him altogether ineligible as a member. In both these cases the removal of the newly elected from the list of members is wrongfully put to the account of secession. The growing certainty that a man will obtain a pension by adhering to the fund will also act in time as a powerful check on desertion; for it is not likely that men will leave the society at their former rate when they remark a growing pension list of thousands a year. The rate of exclusion returned therefore requires generally some considerable modification.

On these grounds I am led to consider that a scale of secession, such as fairly represents the real extent of withdrawal from the roll of permanent members, may be framed after attentive observation of the Friendly Society experience. For the purpose of dealing accurately with certain important public interests, it has been my duty to attempt the construction of a table of this description. The nature and details of this computation of the probable decrement caused by secession among the members of benefit clubs were carefully set forth and published between eight and nine years ago in the appendix to the Report of the Commission for Manning the Royal Navy. I am of opinion that the scale in question may be taken to represent correctly the extent of secession which usually prevails in large benefit societies of the ordinary class. Stated in an abbreviated form, the scale of secession, that is, the per-centage of withdrawal out of 100 men present at each age, which has been adopted by me for the normal rate, is as follows:

Medium age.	Secession, per cent.
18	2·714
23	2·841
28	1·995
33	1·661
38	1·026
43	·824
48	·570
53	·520
58	·451

When this measure of secession is combined in the proper technical manner with the law of mortality, the number present in great benefit societies at each successive year of life, out of a certain number starting at any one particular age, is brought under observation.

For instance, where the mortality is that found to prevail among the members of friendly societies,* and the rate of secession is in the ratio of that above set forth, the decrement by reason of the two combined causes alluded to, which would take place among 100,000 men starting at the age of 18, is as undermentioned. And in order to judge of the force of the principle of secession, the decrease, through the agency of mortality only, in a similar body of men at the age of 18, is supplied for the purpose of comparison:—

Age.	Number present. Mortality and Secession.	Number living. Mortality only.
18	100,000	100,000
20	92,744	98,069
25	77,076	93,941
30	65,849	89,721
35	57,105	84,922
40	50,220	79,277
45	44,464	73,334
50	39,672	67,574
55	34,710	60,746
60	29,297	52,489

From these results it may be gathered that where the effect of mortality by itself would be the reduction of a force of 100,000 men first observed at the age of 18, to a corps of but 52,489 men at the age of 60, the further effect of secession would at the same age of 60 have reduced that force to the much lesser number of

* Report on Friendly Societies, Part 2, 1854. Parl. Paper 506.

29,297 persons. No small weight therefore is given of the effect of secession, in the above computation framed, in recognition of its influence.

On carrying the process a step further, and on combining the above tables respectively with a suitable rate of interest common to both, the present value of a life annuity at each age can be shown; and the additional force of secession in contrast with the effect produced merely by mortality alone will perhaps be more clearly appreciable where the results are shown in a pecuniary form.

Medium age.	Present value, Life Annuity.	
	Mortality only.	Mortality and Secession.
	£	£
18	20,438	14,864
20	20,174	15,013
25	19,285	15,436
30	18,250	15,514
35	17,162	15,333
40	16,074	14,834
45	14,875	14,050
50	13,420	12,882
55	11,923	11,619
60	10,500	10,408

It is by this table, where the elements of mortality and secession united supply the results above set forth, that the worth in ready money of the engagements and resources of the Amalgamated Society of Engineers has in the present inquiry been subjected to computation.

Of the 33,007 members of which the Amalgamated Engineers Society was composed at the close of 1866, 3,639 were admitted during the year, 376 died, and 1,137 were excluded during the same period. One-half of the admissions therefore falls to be deducted, and one-half the deaths and exclusions has to be added to obtain the mean number of members present during the whole of the year; namely, 31,944 persons.

The average age of the 3,639 candidates admitted members during the twelve months is stated to have been $26\frac{1}{2}$ years. It is a singular coincidence, if it be nothing more, that from certain returns prepared during the present year for the purpose of determining a question relative to the wages of the artificers employed in the royal dockyards, it appears that the average age at entry of 9,486 artificers is $26\frac{3}{10}$ years, (Parl. Paper, No. 454, App. to).

It has been stated that 1,137 persons enrolled as members were excluded during the year 1866. But among these, a reference to the appendix (pp. 404-421) to the report of that year, shows that 164 of the number never were members *de facto* at all, not having been eligible from over age, or under age, or from want of character, or not having qualified themselves by payment of entrance fees for admission to the society. Nearly $14\frac{1}{2}$ per cent. were not in the category of secession therefore, and the real seceders were in truth but 973 in number out of the 1,137 set down as excluded.

Again, out of the 376 deaths, 11 were those of non-free members, leaving 365 as the number of deaths which took place among the free members.

No one of the 3,639 members admitted during 1866 could claim the position of a free member until the year expired. The number of free members at the end of the year was therefore but 29,368 out of the 33,007 on the books. But as during the year 365 free members died, and as 973 persons qualified to be free members (though perhaps not all such in fact) were excluded, one half the sum of these two numbers, that is to say, 669 persons, must be added to the 29,368 members above mentioned to give the mean number of free contributors present during the year, viz., 30,037 for the average strength, out of which 365 deaths took place; and these facts being given, from them it results that the mortality among the members during the year was at the rate of 1·215 per cent. on the average.

A reference to the table of mortality deduced from the experience of the friendly societies of the metropolitan province, and published in the "Return to an "order of the Hon. House of Commons, dated 11th "August 1854, for copies of reports and tables by "the actuary of the National Debt Office on the sub-"ject of sickness and mortality among the members of "friendly societies" (Parl. Paper, 506), will disclose that the above-mentioned rate of mortality corresponds very nearly with that assigned to males of the age of 35 years.

From the means available for the purpose the mean age of the artificers employed in the royal dockyards was computed to be 37 years. Accordingly, in placing the mean age of the members of the Amalgamated Society of Engineers at 35 years, there will probably be no discrepancy with the fact; and most certainly there will be no unfavourable view taken of the case in proceeding to a valuation of the benefits on this basis.

It has been stated before the Commission on competent testimony that the members of the Amalgamated Society generally failed to earn the full rate of wages, or in other words decayed in their powers, about the age of 58. On authority already alluded to it is found that the dockyard artificers are usually pensioned at the age of 56. Ample liberality will be extended to the case of the Amalgamated Engineers, therefore, if the probable average age of the members at the period of their entering upon the superannuation allowance is placed at 60 years.

The mean age of the members at present on the pension list is quite another thing. In the absence of positive information it must be a matter of estimate. But looking at the progress and rapid increase of this item of charge, which within the last four or five years has grown up from 2,654*l.* per annum in 1862 to 5,232*l.*, or double the amount, in 1866, and which observed much the same rate of growth in the five years ending with 1862; keeping in view also the probable age on admission to the list, it will perhaps be no unfair assumption which puts the mean age of all the superannuated members now on the pension list at the age of 66.

As the sick allowance ceases when the superannuation allowance commences, the duration of the first-mentioned benefit does not go beyond the age of 60 years.

For similar reasons, as the payment of contribution ceases when the benefit of superannuation is entered upon, the yearly contribution is in the nature of a temporary life annuity ceasing at the age of 60. But its ordinary value is subject to two causes of diminution. One is the suspension of its payment during any receipt of sickness benefit by the contributor. The other cause, which is of more importance, has been alluded to already.

It is at this point that it should be observed that the influence of secession is trenchant both ways. If it diminishes the probability of any future claims, so also does it reduce the probability of any constant future payment by the members. The value therefore of the temporary life annuity is proportionately decreased by the effect of the secession so much relied upon in another direction; and the gain is not all on the side of those assuring the benefits. The real nett liability of the fund is a question of balance between the present value of the benefits assured, and the present value of the contribution assets. The further question of the solvency of the fund is determined by the relation borne by that balance to the tangible assets which should be in hand to meet and liquidate it. But reserving this last matter for future decision, it is clear as far as regards the value of the contribution payable by the members of the Amalgamated Society, that it is deteriorated in worth by the two causes above mentioned, namely, occasional suspension and secession.

It is necessary to advert to one other point in taking account of the society's position. The rate of interest at which the tangible funds in hand, and those falling in by future contribution, are assumed to be laid up

for improvement is a point of some moment. From the information supplied by the report it is shown that the balance at the credit of the society at the close of the year 1866 was 138,113*l.* The balance at the close of 1865 was 115,357*l.* A medium between these two sums shows that the probable average balance in hand during the year was 126,735*l.* Credit is further taken in the statement of income and expenditure for the receipt during the year of 3,658*l.* 12*s.* 0*d.* bank interest. From these data, therefore, it would appear that the yearly rate of improvement of the whole capital in hand was about 2*l.* 17*s.* 9*d.* per cent. on the average.

Consequently, in giving the society credit for being capable in the long run of accummulating their funds at the rate of 3¼ per cent. per annum, and in discounting their liabilities in the valuation at this rate of interest, a further step of advantage is conceded in favour of the position of the association.

Practical application of the foregoing considerations to the engagements and resources of the society will now follow.

The number of members, contributng and non-contributing, who are assured are respectively as undermentioned. The report states that at the close of the year 1866, 33,007 members remained assured. Of this number, however, a certain portion was in receipt of superannuation allowances, which allowances in their aggregate amounted to 5,632*l.* per annum. Dividing this outgoing by the lowest average year's rate of pension, viz., 18*l.* 4*s.* 0*d.*, in order to reduce to a minimum the amount of charge in the other branches, it would appear that 287 members are no longer paying contributions, by reason of their position on the superannuation list. There remained, therefore, at the close of the year 1866 32,720 contributing members, assured for all the benefits contemplated under the society's rules.

From this fact a conclusion follows, which has not perhaps attracted sufficient attention. The number of members being on a very large scale the engagements of the society are of corresponding dimensions. 10*s.* a week in sickness being guaranteed to each of 32,720 members, it follows that 16,360*l.* per week in sickness is the allowance assured to the whole mass. The average annuity in old age being taken at 20*l.* 16*s.* per man, it follows that a pension for life of 680,576*l.* per annum is assured to the collective body. And 12*l.* at death being the sum assured to each member, it results that the sum assured to the whole corps of contributors is 392,640*l.* Further, a reference to the printed annual statement shows that in addition to these contingent benefits there is as already stated absolutely at present in course of payment pensions to the amount of 5,232*l.* per annum.

On the other hand, there is forthcoming from the members a contribution of 1*s.* a week per man, which in the aggregate produces a revenue of 85,072*l.* per annum.

Valued in the ordinary way by the tables contained in the Report on Friendly Societies, Part 2nd, 1854, like the engagements and contributions of any common benefit society, the liabilities and assets of the Amalgamated Engineers can be shown to be as undermentioned:

STATEMENT.

Liabilities.									
To present value	£16,360 weekly allowance in sickness until 60							£355,339	0 0
,, ,,	680,576 per annum pensions for life after 60							1,985,512	0 0
,, ,,	392,640 sums payable on death							168,167	0 0
,, ,,	5,232 pensions at present in course of payment							44,697	0 0
						Liabilities		2,553,715	0 0
Assets.									
By present value	£85,072 yearly contribution payable until 60					1,254,395	0 0		
,, ,	£1,636 weekly contribution suspended during sickness, which abate					35,534	0 0		
					Remains	1,218,861	0 0		
,, Tangible assets in hand					£138,113	0 0			
Arrears					10,068	0 0			
						148,181	0 0		
							Assets	1,367,042	0 0
							Deficit	£1,186,673	0 0

This view of the society's affairs, however, is not justly admissible. It was very properly observed in the evidence given by the society's general manager at the last meeting before the recess, of the Commission that calculations with reference to the operation of the ordinary friendly societies must necessarily differ very much from those necessary in the case of a society combining benefit with trade purposes. The effect of secesssion no doubt was here alluded to. I will, therefore, now proceed to exhibit the influence of this principle on the various liabilities of the society as far as I consider it can be legitimately applied.

A reference to the Friendly Societies Life Annuity Table in the published report already alluded to will show that the present value at the age of 35 of a temporary life annuity of 1*l.*, ceasing at the age of 50, is 14,2451 (14*l.* 4*s.* 11*d.*) year's purchase. When the element of secession, prevailing to the extent set forth in the present paper is introduced, the value of the temporary annuity will be diminished to 12·933 (12*l.* 18*s.* 8*d.*) year's purchase. The ratio of the value of the first annuity to that of the second is therefore as 1 to ·9079.

The allowance in sickness, guaranteed by the society is 10*s.* per week for 26 weeks, and 5*s.* per week for the remainder of the sickness. This allowance is secured until the pension in old age commences.

In the last five years of the society's proceedings the sums paid in sickness to those sick out of an aggregate mean strength of 129,613 free members was 64,538*l.* This is at the rate of 9*s.* 11½*d.* per week each, or nearly the payment for seven days' sickness. By the friendly societies general experience this is the number of days sickness in the year which falls to the share of a male aged 35 years. The computation is not of very much weight; but it serves to strengthen the opinion that the mean age of the members is not unfairly taken when placed at the number of years above mentioned.

In order not to overstate the present value of the charge for allowances in sickness, the table based on the general experience of the sickness prevailing among all classes of the members of friendly societies has been selected for the purposes of computation; although it is probable that in the opinion of some the higher values set forth in the table for trades engaged in heavy labour would have been more applicable to the case.

At the age of 35, the present value of 1*l.* per week in sickness where the claim to allowance ceases at the age of 60 is 21·720, according to the table (No. 4) in the report on the Friendly Societies' experience in 1854 (Parl. paper 506.) Consequently 16,360*l.* per week of allowance in sickness must be worth in capital

value a sum of 355,339*l.* And again, this sum, when reduced in the proper ratio (·9079) on account of the principle of secession, is diminished to a result of 322,612*l.* as the true worth in ready money of the sickness benefit guaranteed by the society.

It may perhaps be pointed out that under the rules the sickness allowance is reduced at the end of 26 weeks to half its previous amount. This stipulation has not been overlooked. But it is considered that the advantage arising to the society from this regulation is counterbalanced by a liability dismissed hitherto from valuation, but which otherwise would have to be brought into account. The item of charge alluded to is the compensation given for accidents, in addition to the further privilege of continuing assured for the sickness benefit at a moiety of the ordinary contribution. The society's accounts show that the outgoing for compensation is about 11 per cent. of the expenditure for sickness—an amount sufficient to prove that the moderate advantage derived from the reduction at the end of the 26 weeks must be completely neutralized by a constant charge of the above nature and extent. There is not sufficient ground on this account therefore for any reduction of the value placed above on the liability for allowances in sickness; which will accordingly remain at 322,612*l.*

The superannuation benefit is next in order for valuation.

The yearly pension in superannuation where the member has been 30 years in the society is 23*l.* 8*s.* 0*d.* Where the member has contributed but 25 years it is 20*l.* 16*s.* 0*d.* And where the member has been on the books 18 years it is 18*l.* 4*s.* 0*d.* It has been already mentioned that a temporary life annuity of 1*l.* ceasing at the age of 60, is worth at the age of 35 a sum of 12*l.* 18*s.* 8*d.*, or 12·9331 years purchase, where the principle of secession is combined with the law of mortality. At the age of 35 by the same table an annuity of 1*l.* for the whole duration of life is worth 15*l.* 6*s.* 8*d.*, or 15·3334 years' purchase. It follows, accordingly, that 2*l.* 8*s.* 0*d.*, or 2·4003 years purchase, the difference between the two foregoing quantities, is the present value of the deferred annuity, commencing at 60 and continuing until death. Because the two annuities together, temporary and deferred, must make up the complete annuity for the whole continuance of life.

It is not probable that men who are supposed to enter the society at the age of 26, and who otherwise are qualified for receipt of the pension, will on attaining the age of 60 or thereabouts be generally found to have contributed to the funds of the society but for 18 out of the 34 intervening years time, and so have disentitled themselves to any but the lowest amount of benefit. Neither is it much more likely on the other hand, reference being had to the probabilities of secession, that all who are found entitled at the age of 60 to superanuation, will have been constant subscribers for a period of more than 30 years, and thus have qualified themselves to claim the highest class of allowance. The more probable result will be that the bulk of the superannuated members will be found to be entitled to the medium amount of pension, which proceeds upon the supposition that the claimant has been "in the society" for at least 25 years. This would allow for about nine years or so of absence on different occasions from the society, and would place the date of the member's permanent connection with the association from about the age of 34. This seems a reasonable position. Under this view of the case the member on superannuation would be entitled to the average provision of 8*s.* a week, or 20*l.* 16*s.* per annum, and the aggregate pension guaranteed to the 32,720 members of the society would, as already has been assumed be, 680,576*l.* per annum.

As each 1*l.* a year of life annuity commencing at 60 is at 35 years age worth 2·4003 years purchase as above stated, it follows that the 680,576*l.* of pension is worth in ready money no less a sum than 1,633,586*l.*

Funeral Benefit.

On the death of a free member the sum of 12*l.* is to be paid to defray his funeral expenses. But a free member can receive 5*l.* at the death of his wife; "7*l.* to remain for his own funeral expenses." "No member to have more than 12*l.* funeral benefit both for himself and wife."

This is an arrangement which in effect assures 5*l.* at the death of either husband or wife, and 7*l.* besides at the death of the husband. The risk of assuring 12*l.* under the foregoing conditions is a trifle greater (about 10 per cent.) than where 12*l.* is assured simply on the single life of the husband. But probably all the members of the society are not married men. It will simplify the question, and be to the advantage of the fund, if it is assumed that every member remains assured for 12*l.*

At the age of 35, by the Friendly Societies experience (p. 34, Rep. 1854, F. S. Returns, Parl. P. 506) it appears that 10*l.* may be assured for a sum paid down of 4*l.* 5*s.* 8*d.* A sum of 5*l.* 2*s.* 9*d.* paid down (or more exactly in decimals 5·1396) would therefore assure 12*l.* But this single premium of 5*l.* 2*s.* 9*d.* should be diminished by about 10 per cent. on account of the probabilities of secession. This will reduce the cost of the assurance to 4*l.* 12*s.* 6*d.* in respect of each member; consequently, as there are 32,720 members assured, the present value of the risk undertaken by the society in this particular class of benefit must be set down at a sum of 151,330*l.*

Finally, as regards the debit side of the account, there are the pensions at present in course of payment. In the report of the society's affairs this item is stated to be an outgoing of 5,232*l.* per annum. At the probable mean age of the annuitants at present in receipt of this benefit, viz., 66, an annuity of 1*l.* on a male life, according to the Friendly Societies experience (p. 32, Rep. 1854, Parl. P. 506) is found to be worth 8·5413. This value is not affected by the question of secession, as this principle ceases to act on those who have entered into receipt of superannuation benefit. It follows therefore that an annuity of 5,232*l.* must be worth, in ready money, a sum of 44,688*l.*

There is yet one other description of benefit, although the charge on this account certainly does not fall within the ordinary category of allowances. This is the donation to members out of employment.

It is not easy perhaps to bring this detail of expenditure under precise conditions of valuation. Nevertheless, there does seem to be a method of casting it with more or less accuracy into the shape of present value. Any claim to benefit under this head of relief ceases of course when the period of superannuation is attained. The yearly issue of money on this ground is of irregular, and, to a certain extent, of fortuitous amount. But, as a matter of fact, it appears to have amounted on the average of the sixteen years of the society's experience, to nearly two and half times the outgoing for sickness allowances. And, indeed, to this description of benefit it seems to bear a sort of rough analogy. If it should be assumed that in the long run this particular charge, to the inherence of which in the constitution of the society it is unnecessary more fully to advert, will not, on the whole, exceed *two*-fold the limits of the outgoing for sickness, it will figure in the general liabilities of the society for a sum of 645,224*l.*; or in plain language double the fund required to guarantee the present sickness benefit.

To meet the society's liabilities, both ordinary and extraordinary, there are the following resources; namely, the funds in hand, the arrears due to the association, and the regular contributions.

It has been pointed out that the 2*l.* 12*s.* per annum payable by each member is in the nature of a temporary life annuity, continuing on the average until the age of 60 is attained. As the annuity in the present case is receivable in small weekly instalments made in advance, it is enhanced in value by half a year's purchase. Under the rules, however the

contribution in question is subject to occasional suspension during the receipt of benefit in sickness. As this abatement prevails during sickness to the extent of 1*s.* a week, the loss to the society is obviously of neither more nor less present value than an allowance in sickness to that amount. It has already been shown that a temporary life annuity of 1*l.*, where secession is present as an element, is worth in ready money 12*l.* 18*s.* 8*d.*, or with half a year's purchase added thereto, 13*l.* 8*s.* 8*d.* It results therefore that 2*l.* 12*s.* per annum must be worth 34*l.* 18*s.* 6*d.* But as it may be ascertained from the value placed upon the aggregate sickness benefit that an allowance of 1*s.* per week in sickness is worth 19*s.* 8¾*d.*, this sum on being deducted from 34*l.* 18*s.* 6*d.* leaves the nett value of the contribution subject to occasional suspension in sickness at a sum of 33*l.* 18*s.* 9¼*d.* (in decimals 33·9385). Multiplying this amount by 32,720, the number of contributors, the present value of the contributions payable to the society is found to be 1,110,468*l.* The tangible assets of the society are as already stated 148,181*l.* Putting all these various items together in the usual manner, the amount will stand as follows:

STATEMENT.

Liabilities.			
To present value of the weekly allowance in sickness		£322,612	0 0
„ future pensions in superannuation		1633,586	0 0
„ sums at death		151,330	0 0
„ pensions in course of payment		44,688	0 0
Liabilities		£2,152,216	0 0
Assets.			
By present value contributions payable	£1,110,468 0 0		
„ tangible assets	148,181 0 0		
Assets		1,258,649	0 0
Deficiency		£893,567	0 0

For this deficit of 893,567*l.*, which is exclusive of the further probable charge for donations to those out of employment, valued at 645,224*l.*, there does not seem to be any remedy but a resort to the system of levies.

In confutation of a statement which attributes such an enormous deficit as that above-mentioned, it will no doubt be alleged that although a certain allowance has been made for the probable secession, sufficient abatement on this point has not been conceded. There may be some force perhaps in this allegation. But it will be made evident, nevertheless, that even when the most extensive modification of the values attached to the respective liabilities in the foregoing account are allowed to take place, the balance against the fund still remains of vast dimensions.

It is not impossible that in the guarded estimate of the ordinary rate of secession which has been adopted as the basis of the valuation above given, the per centage of secession prevailing among the Amalgamated Engineers may be inadequately represented. I have endeavoured previously to show, however, that there is reason to believe that the amount of exclusion which is inaccurately accepted as secession is an exaggerated statement of the true amount of departure in the law of benefit clubs. It is also open to conjecture that the facilities of joining a trades union society, although it may combine with its primary purpose the usual advantages of a friendly society, are far greater than those afforded by the ordinary institutions which have merely the assurance of a provision in sickness, old age, and for burial in view. But an attempt will be made to give full weight to the secession which appears to prevail in the amalgamated society.

The mean number of members present and the exclusions during the last five years of the society's proceedings, were as follows:

Year.	Mean number present.	Excluded.
1862	23,490	812
1863	25,192	842
1864	27,551	859
1865	29,904	1,074
1866	31,944	1,137
	138,081	4,724

But deducting from both of these amounts 14½ per cent. of the exclusions, viz. 685 persons, for those who were never qualified to be members at all, the correct numbers will be 137,396 contributors and 4,039 exclusions or secessions. From these figures it would result that the proportion of secession during the last five years has been at the rate of 2·94 per cent.

According to the table which has been used for the purpose of this enquiry, the 137,396 members in question would group themselves at the ages undermentioned in the following order; and according to the rate of secession which went to form the same table, the number seceding out of the several groups would be computed to be as follows:

Age.	Members present.	Seceders.
26 and under 31	28,323	565
31 „ 36	24,444	406
36 „ 41	21,373	219
41 „ 46	18,872	156
46 „ 51	16,801	96
51 „ 56	14,856	77
56 „ 61	12,727	57
	137,396	1,576

By the table made use of, therefore, the average per centage over the whole mass would be computed at 1·15 per cent. And where the experience of the Amalgamated Engineers, accepted as the true normal rate, the table adopted would seem to undervalue the secession by 60 per cent.

An endeavour will be made to give the case of the Amalgamated Society the full benefit of this supposition as to the rate of secession prevailing among the members; and to correct what may appear to some the too rigorous valuation already given.

According to the first valuation made in the ordinary fashion without reference to secession of the engagements undertaken by the Amalgamated Engineers, the liabilities, excluding the premiums in course of payment, were valued as under-mentioned:

In respect of sickness	£355,339
„ of future pensions	1,985,512
„ sums at death	168,167
Total	£2,509,018

Where the element of secession was a consideration admitted into the valuation, the same items were valued—

In respect of sickness	at	£322,612
„ future pensions	„	1,633,586
„ sums at death	„	151,330
Total		£2,107,528

Consequently the difference between the above two computations of the liability, namely, 401,490*l.*, grew

out of the important element of secession merely. But there appear to be grounds for thinking that this element has been undervalued by 60 per cent. Admitting that it is so, the above difference should be correspondingly increased in this ratio, and there should be abated from the first valuation, not 401,490*l.*, but 1,003,725*l.*; for, take off 60 per cent. from 1,003,725*l.*, the residue will be 401,490*l.* The liability under the second mode of valuation should, in this case, therefore have been put at - - £1,505,293 0 0

And adding thereto the item for pensions in course of payment, which are not affected by the question of secession, viz.: - - - - - - - - - - - 44,697 0 0

The total liability should be placed at - - - - - - - - -			£1,549,990 0 0
But under a corresponding regimen the present value of the contributions is likewise reduced to - - - - - - - - -	£947,879 0 0		
To which, adding the tangible assets - - - - - -	148,181 0 0		
The whole assets now only amount to - - - - - - - -			1,096,060 0 0
And the deficiency under this view of the case is found to be - - - - - -			£453,930 0 0

As the item of the liability for sickness under a similar mode of computation is now found to be but 273,521*l.* in lieu of 322,612*l.*, as before, the probable present value of the future charge for donations to the members out of employ will be computed at twice the above amount for the sickness liability, viz., at 547,042*l.* And when this is added to the computed deficiency on the other benefits, viz., 453,930*l.*, there will appear to be 1,000,972*l.* of liability, for which there seems to be no mode of provision but by the method of levies.

If it were desired to know what common rate of contribution could prudently have been adopted in the commencement by the Amalgamated Engineers for the provision of the benefits in sickness, old age, and at death, contemplated by their rules, it might in my opinion be shown from the tables made use of for the second of the foregoing valuations, that a weekly subscription of 1*s.* 6*d.* per man would probably have been sufficient.

Had this rate of contribution now been payable, and had the sums paid away in donations and aids to other trades, viz., 313,397*l.*, been now in the society's strong box, the increase in the present value of the contribution assets, together with the amount last mentioned*, would, on a rough computation, in which any reference to the consideration of interest of money is omitted, have very nearly effaced the deficiency of 893,567*l.* shown in the valuation.

As regards the constitution of the Amalgamated Society of Carpenters and Joiners, it is in principle generally the same as that of the Amalgamated Engineers. In certain points of detail also the rules of both societies are identical. The amount of weekly contribution, the amount of weekly donation to those out of employ, the funeral benefit, and the accident benefit with its attendant privilege, are the same in both cases. But there is a difference between the two sets of rules in respect of the sickness and superanuation benefits. The Carpenters and Joiners give 12*s.* a week in sickness for the 26 weeks in lieu of 10*s.* a week for a similar period, and the maximum provision in superannuation to members over 50 years of age is 8*s.* a week after 25 years successive contribution.

The average pension after 18 years successively is 7*s.* a week, and there is a minimum pension of 5*s.* a week after 12 successive years contribution. A grant of 6*l.* for emigration purposes is given in certain contingencies. Some trifling variations from the model there are, in respect of the limits of age on admission, and the amount of entrance fee. But they are not important. The virtual coincidence on most of the material stipulations contained in the rules of either society seems therefore to make any more detailed account of the regulations of the Amalgamated Carpenters and Joiners perfectly unnecessary.

The society was formed in 1860. Its experience is of too short duration, therefore, to have any weight. It consisted at the close of the year 1866 of 8,002 members, possessing a fund 13,052*l.*, besides arrears due to the amount of 2,173*l.* It is stated that the number of members admitted during the year was 3,743, and that the number excluded was 1,149. The number of deaths during the year was 39. Out of the gross number of 1,149 members excluded, 410 were removed for non-payment of the entrance fees. Consequently they never were members at all, and the true extent of secession was 739 members. This fact demonstrates that secession is not the same thing as exclusion, so termed. In the present case the gross amount of exclusion is 36 per cent., above the true amount of secession, while in the Engineers society it was 14⅔ per cent.

As the number of members forming the society at the close of the year 1865 is returned at 5,670, and the excess of admissions over removals during the year was 2,561, I am unable to see how it is that the number of members at the close of 1866 does not exceed 8,002. But admitting this number to be correct, and abating therefrom, and also from the number of admissions and exclusions, the 410 persons who never qualified as members, and following the mode of computation adopted in the like circumstances in the case of the Engineers society, it would appear that the mean number of members of the Amalgamated Society of Carpenters and Joiners present during the year consisted of 6,314 persons. If this result may be accepted, it would follow that the rate of secession during the year was more than 11½ per cent.

The rate of mortality deduced from the deaths of the year likewise present an anomalous result. 39 deaths among 6,314 persons gives a death rate of 6·177 to 1,000 persons This is a rate which corresponds to a mean age of 15 years only in the Friendly Societies experience. The truth is that the excessive rate of secession and the recent establishment of the society are causes which prevent any trustworthy conclusion on this point.

Under these circumstances, and in the absence of any information as to the present average age of the members or their age on joining the society, it is difficult to present any unquestionable statement of the probable position of their pecuniary liabilities. The utmost it appears to me that can be done is to adopt the not unreasonable supposition that the case of the Amalgamated Society of Carpenters and Joiners does not materially differ on the point of age from the circumstances of the Amalgamated Engineers or the dockyard artificers, and that like these persons they enter their trades unions at the usual age, and as an assemblage are on a medium of the age of 35 years. If this position may be taken up valuations or estimates of the present value of their engagements and assets may be formed on the plan adopted in the case of the Engineers. Nevertheless, as the amount of secession prevailing among the members of the Carpenters Society is so considerable as to argue an instability of purpose not inseparable from a corresponding immaturity of years, it may be nearer the truth, perhaps, and more fair to the Carpenters to assume that the mean age of the society is two years below that of the Engineers, and that on a medium the present members are of the age of 33 years.

* £1,110,468
½
555,234
313,397
£868,631

The aggregate benefits of the ordinary class guaranteed under each head by the Amalgamated Carpenters' Society are as under mentioned. In sickness, until the age of 60, 4,801*l.* per week. In old age after 60, 145,636*l.* per annum; an average pension of 7*s.* per week per man having been assumed. Sums payable at death 96,024*l.* There are no pensions in course of payment.

On the other hand, the yearly contributions payable are taken at 20,805*l.* per annum, and the tangible assets at 15,225*l.* of money.

Valued in the ordinary way like any common benefit society, the affairs of the society would be shown as follows:

STATEMENT.

Liabilities.				
To present value	£4,801	per week of sickness benefit		£105,329 0 0
„ ditto	145,636	per annum of future pension		389,489 0 0
„ ditto	96,024	sums assured at death		39,783 0 0
		Liabilities		534,601 0 0
Assets.				
By present value	£20,805	per annum of contribution	£321,079 0 0	
„ tangible assets			15,225 0 0	
		Assets		336,304 0 0
		Deficiency		£198,297 0 0

But giving, on an estimate of the condition of the society, the benefit of a reasonable diminution of the present value of the charges on account of the probable effect of secession on the future claims, the amount would result as under mentioned:

STATEMENT.

Liabilities.				
To present value	£4,801	per week sickness benefit		£94,216 0 0
„ ditto	145,636	per annum of future pensions		310,172 0 0
„ ditto	96,024	sums assured at death		35,385 0 0
		Liabilities		439,973 0 0
Assets.				
By present value	£20,805	per annum of contributions	£287,204 0 0	
tangible assets			15,225 0 0	
		Assets		302,429 0 0
		Deficiency		£137,544 0 0

And assuming, as previously was done in respect of the Amalgamated Engineers, that the donations are in present value about twofold the amount of the sickness benefit, there would exist a probable further liability of 188,432*l.*

But it may be urged with the same force as might apply to the case of the Amalgamated Engineers, that the rate of secession in the Amalgamated Society of Carpenters and Joiners will probably far exceed the cautious estimate taken of the effect of the withdrawal which takes place among ordinary great benefit clubs.

In reply to this proposition, and without admitting that the amount of secession which took place last year in the society is a true measure of the normal decrement which will perhaps hereafter prevail at a later stage of the society's growth, it may be conceded for the purpose of a more liberal calculation of the engagements of the association that these annual percentage of secession among the Amalgamated Carpenters will at least be as high as that supposed for the purposes of argument to obtain among the Amalgamated Engineers. In this case the rate of secession adopted above must be enhanced to the extent of 60 per cent., and the liabilities and assets should be computed to be as follows:

STATEMENT.

Liabilities.			
To present value of the three benefits already specified			£298,031 0 0
Assets.			
By present value of the annual contributions		£236,392 0 0	
„ Tangible assets		15,225 0 0	
	Assets		251,617 0 0
	Deficiency		46,414 0 0

And adopting the same measure of the present value of the future donations as that already laid down as affording a fair gauge of the pressure, the further liability on account of this charge would be placed at a sum of 155,094*l.*

It may also be observed, that after balancing the extent of increase in certain benefits guaranteed by the Amalgamated Society of Carpenters and Joiners, against the decrease in other engagements, and notably in the scale of pensions, it is probable that a weekly contribution of 1*s.* 6*d.* would likewise be a fair subscription for the benefits in sickness, old age, and death secured under the regulations of the Carpenters and Joiners Society. In conclusion it may be remarked that it is too frequently unobserved that regulations which leave the funds required to meet definite contingencies open to diversion for casual and incalculable demands, have also the effect of removing the conditions which are generally indispensable to permanent success.

I am, Sir, your obedient servant,
ALEXANDER GLEN FINLAISON,
Actuary of the National Debt.

J. H. Patteson, Esq.
Secretary,
Trades Unions Commission.

REFORM CLUB
PALL MALL

COMMISSION.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

To Our right trusty and well-beloved Councillor Sir William Erle, Knight; Our right trusty and right well-beloved Cousin Thomas George Earl of Lichfield; Our trusty and well-beloved Francis Charteris, Esquire (commonly called Lord Elcho); Our right trusty and well-beloved Councillor Sir Edmund Walker Head, Baronet, Knight Commander of Our most Honourable Order of the Bath; Our trusty and well-beloved Sir Daniel Gooch, Baronet; Our trusty and well-beloved Herman Merivale, Esquire, Companion of Our most Honourable Order of the Bath; Our trusty and well-beloved James Booth, Esquire, Companion of Our most Honourable Order of the Bath; Our trusty and well-beloved John Arthur Roebuck, Esquire, one of Our Counsel learned in the Law; Our trusty and well-beloved Thomas Hughes, Esquire, and Frederic Harrison, Esquire, Barristers at Law; and Our trusty and well-beloved William Mathews, Esquire, greeting.

Whereas it has been represented unto Us that it is expedient that inquiry should be made into the several matters herein-after mentioned.

Now Know Ye, that We, reposing great trust and confidence in your ability and discretion, have nominated, constituted, and appointed, and do by these Presents nominate, constitute, and appoint, you, the said Sir William Erle, Thomas George Earl of Lichfield, Francis Charteris, Esquire (commonly called Lord Elcho), Sir Edmund Walker Head, Sir Daniel Gooch, Herman Merivale, James Booth, John Arthur Roebuck, Thomas Hughes, Frederic Harrison, and William Mathews, to be Our Commissioners for the purposes of the said inquiry.

And We do hereby enjoin you, or any Four of you, to inquire into and report on the Organization and Rules of Trades Unions and other Associations, whether of Workmen or Employers, and to inquire into and report on the effect produced by such Trades Unions and Associations on the Workmen and Employers respectively, and on the Relations between Workmen and Employers, and on the Trade and Industry of the Country; with power to investigate any recent acts of intimidation, outrage, or wrong alleged to have been promoted, encouraged, or connived at by such Trades Unions or other Associations, and also to suggest any improvements to be made in the law with respect to the matters aforesaid, or with respect to the relations between Workmen and their Employers, for the mutual benefit of both parties.

And for the better discovery of the truth in the premises, We do by these Presents give and grant unto you, or any Four of you, full power and authority to call before you, or any Four of you, such persons as you shall judge necessary, by whom you may be better informed of the truth in the premises, and to inquire of the premises and every part thereof by all other lawful ways and means whatsoever.

And Our further Will and Pleasure is that you, Our said Commissioners, do, with as little delay as may be consistent with a due discharge of the duties hereby imposed upon you, certify unto Us from time to time, under your hands and seals, your several proceedings in the premises.

And We do further will and command, and by these Presents ordain, that this Our Commission shall continue in full force and virtue, and that you, our said Commissioners, or any Four of you, shall and may from time to time proceed in the execution thereof, and of every matter or thing therein contained, although the same be not continued from time to time by adjournment.

And for your assistance in the execution of these Presents We do hereby authorize and empower you to appoint a Secretary to this Our Commission, to attend you, whose services and assistance We require you to use from time to time as occasion may require.

Given at Our Court at St. James, the Twelfth day of February 1867, in the Thirtieth Year of Our Reign.

By Her Majesty's Command.

S. H. WALPOLE.

SEVENTH REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners appointed to inquire into and report on the Organization and Rules of Trades Unions and other Associations, whether of Workmen or Employers, and to inquire into and report on the effects produced by such Trades Unions and Associations on the Workmen and Employers respectively, and on the Relations between Workmen and Employers, and on the Trade and Industry of the Country; with power to investigate any recent acts of intimidation, outrage, or wrong alleged to have been promoted, encouraged, or connived at by such Trades Unions or other Associations, and also to suggest any improvements to be made in the law with respect to the matters aforesaid, or with respect to the relations between Workmen and their Employers, for the mutual benefit of both parties, have held several meetings, and humbly beg leave to submit to Your Majesty evidence given before us at our meetings held upon the 21st, 28th, and 29th days of April 1868.

(Signed) W. ERLE, Chairman.
LICHFIELD.

REFORM CLUB PALL MALL

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

APPOINTED TO INQUIRE INTO

TRADES UNIONS AND OTHER ASSOCIATIONS.

1, Park Prospect, Westminster, Tuesday, 21st April 1868.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.
Lord ELCHO, M.P.
Sir DANIEL GOOCH, Bart., M.P.
JAMES BOOTH, Esq., C.B.
JOHN ARTHUR ROEBUCK, Esq., M.P.
FREDERIC HARRISON, Esq.
WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. ARCHIBALD HOOD examined.

13,985. (*Chairman.*) Are you the manager of White Hill Colliery, at Lasswade, near Edinburgh?—I am the lessee of the White Hill Colliery.

13,986. Have you had much experience in the management of coal and ironstone mines?—I have been all my life engaged in that occupation.

13,987. And during that time have you had knowledge of several strikes;—Yes. I remember all the principal strikes in Scotland during the last 30 years.

13,988. All the strikes in the iron and coal trade you mean, I presume?—Yes.

13,989. Have they for the most part been strikes for a rise of wages?—The strikes have mostly occurred when the masters proposed to reduce the wages.

13,990. That is to say, the strikes have been on account of wages, either for a rise or to prevent a fall?—Generally to prevent a fall I should say. The miners had no difficulty in getting up their wages when trade was good, it was when the masters proposed to reduce the wages that the strikes generally took place.

13,991. Have the men for the most part succeeded in their object?—No, they have never succeeded in any of the great strikes in Scotland, so far as I can recollect, that is to say, they have never succeeded in anything like general strikes.

13,992. For what length of time have they been out on strike, taking the longest strike?—From five or six weeks to 12 or 13 weeks.

13,993. (*Mr. Mathews.*) When there is an attempt to reduce wages in Scotland, what does it generally arise from?—From dull trade.

13,994. From a falling price of coals in fact?—From a falling price of coals and iron.

13,995. Add the result of a dull trade, a falling price of coals and iron, is that the coal master finds it necessary to reduce wages?—Yes.

13,996. Are you aware what proportion in the cost of a ton of coals the labour bears?—It varies very considerably, I should say.

13,997. Will you give some general estimate?—From a half to a fourth I should say.

13,998. What is the selling price of coal now at your colliery?—The selling price of coal averages perhaps about 5*s.* a ton at our colliery.

13,999. What proportion of that consists of wages to colliers and other people employed in raising coal? To the colliers perhaps from 1*s.* 8*d.* to 2*s.*

14,000. About two-fifths?—About two-fifths for the colliers.

14,001. And what other description of labour which is affected by the colliers' wages exists besides the labour of the colliers themselves?—There are what we call "oncost" men above ground and under ground.

14,002. Are their wages generally affected in the same proportion as the colliers by fluctuations in the price of coal?—No, not to the same extent.

14,003. Are they at all affected?—Yes, but not to the same extent.

14,004. When you reduce colliers' wages, you consider, I suppose, that some reduction is necessary in the wages paid to the other descriptions of labour?—Yes.

14,005. Combining all those descriptions of labour what proportion will the whole reduction bear to the cost of a ton of coals?—Perhaps all the other wages put together would be a little more than one-fifth.

14,006. That would make more than three-fifths in all as the proportion of labour?—Yes, I think it would be rather more than three-fifths, but I have not gone into that matter minutely.

14,007. When there is a fall in the price of coals, unless the colliery owner is to lose money, a reduction in the men's wages is absolutely necessary?—Yes.

14,008. When that attempt, however, is made on the part of the coal master the men are generally dissatisfied and strike?—Generally.

14,009. Do they strike as a matter of form or is there any organization which directs the strike?—There is generally organization when the strikes commence.

14,010. Is that organization the organization of the unions?—Yes.

14,011. Are the unions pretty general throughout the Scotch collieries?—They are.

14,012. As general as in England?—I think they are much the same.

Mr. A. Hood.

21 April 1868.

14,013. Whenever there is a notice for a reduction of wages the union steps in and suggests a strike on the part of the men?—Well, I should think it is done through the instrumentality of the unions; in fact, the men have often told me that they could not act themselves without consulting the union.

14,014. You say that the strikes have generally been unsuccessful?—Generally.

14,015. Is it not almost impossible that they should be successful when the price of coal is reduced?—Quite impossible.

14,016. The coal master could not carry on his colliery giving the old rate of wages with a reduced price of coal?—No.

14,017. He is compelled to reduce wages, and it is not done from any choice of his own?—That is so. I myself never attempt a reduction unless I find it absolutely necessary.

14,018. And I suppose that is the policy of the coal masters generally?—Yes, I believe so.

14,019. How long was the longest strike that you have known?—Thirteen weeks.

14,020. How long since did that take place?—In 1856.

14,021. Was that successful or were the men obliged to succumb?—The men were obliged to succumb.

14,022. There was no improvement, then, in the coal trade during the 13 weeks' strike?—I cannot say that. Prices went up to an enormous extent during the strike, but the masters did not yield, because they knew that prices would fall again when work commenced.

14,023. That state of things formed no general criterion of what the price of coal would be when the men commenced work?—Not the least.

14,024. (*Mr. Roebuck.*) Where was that strike?—In Lanarkshire.

14,025. (*Mr. Mathews.*) Is that where your collieries are?—I have one colliery there.

14,026. Was the strike general all over Scotland at that time or was it confined to Lanarkshire?—It was chiefly in Lanarkshire. I do not think it extended over the whole of Scotland.

14,027. Has there been any subsequent strike to that of any duration?—No, not of any duration. There have been partial strikes, but none so general as that was.

14,028. In the event of the coal trade improving and prices getting better, there is never any disinclination, is there, on the part of the masters to meet that by an advance of wages?—We are all too glad to do it.

14,029. It is an advantage to you, in short?—Yes; because we can generally advance the price more than we give to the men.

14,030. You get more yourselves by the advanced price than the advance which you give to the men?—Yes.

14,031. On the contrary, in a falling market, you lose more by the price at which you sell the coal in the market than the reduction which you make to the men?—Yes.

14,032. So that it is a disadvantage to the master to contemplate a reduction in the price of coal and the necessity of reduction in wages?—Yes.

14,033. Have you ever had any conversation with the men independent of the unions in order to discuss these matters with them during a strike?—Yes; the communication that I have had has mostly been with our own men, but I always understood that they were regulated to some extent by the union.

14,034. What arguments do the men use to show that wages should not be reduced when there is a fall in the value of coals?—I do not think that they go into reasons very closely on that matter.

14,035. They do not like a reduction, and therefore they resist it as long as they can, that is the fact?—Yes.

14,036. And when they are tired of play, or compelled by the exigencies of their position to yield, then they yield and not before?—Yes.

14,037. Have you a good understanding with your men now notwithstanding these unions?—Yes, very fair.

14,038. Can you allege any reason besides the councils of the officers of the union why the men should strike for 13 weeks when they see that there is an absolute necessity for a reduction of wages?—No, they do not condescend upon any reasons.

14,039. They act without reason?—Yes.

14,040. Do they pay the officers of the unions?—I believe they do.

14,041. And have the officers of the unions any other occupations besides that for which they get paid by the union members?—Yes, some of them. We have officers of the union constantly working to some extent.

14,042. Are they employed as colliers?—Yes.

14,043. But they are not altogether dependent upon their work as colliers?—No.

14,044. (*Sir D. Gooch.*) What wages do the men earn in your trade?—In Scotland just now they are earning I should say from 3*s.* to 4*s.* a day.

14,045. And what sort of fluctuations have there been in the rise and fall of wages there?—I believe the fluctuation during the last three years has been to the extent of 50 per cent.

14,046. That is upon 4*s.* a day?—Between 4*s.* and 6*s.* a day. But then they restricted their labour also.

14,047. Reducing the quantity of work you mean?—Yes.

14,048. Have they a rule of that kind in your district?—They have worked upon that principle of restricting their labour to a very great extent during the last few years in Scotland.

14,049. (*Mr. Roebuck.*) Whom do you mean when you say "they?"—The men, the colliers.

14,050. Have they come to you and said, "We do not intend to work for you so many hours a day"?—No, they gave us no intimation whatever; they just did it.

14,051. So that you ascertain the fact from the fact and not from any statement of theirs?—Just so.

14,052. During these strikes you say that you have had communication with your men; have you had any communication with the officers of the union?—No, excepting with officers in my own employment.

14,053. Do you ever communicate with people out of your own employment, people representing unions but not men of your own?—No, I have never communicated with persons in that way.

14,054. Have you made any resolution of that sort that you do not communicate with men outside your works?—No, I have not.

14,055. But you have acted upon that?—I have acted upon it.

14,056. When this strike to which you have referred ceased in what condition were the men?—In a very wretched condition.

14,057. So that the effect of the strike only was to make the men miserable?—That was all I am sorry to say.

14,058. Did that misery affect also their families?—Yes, to a very great extent.

14,059. Have you any idea of the sort of effect that it did produce upon the families; had they less to eat, for instance?—Most unquestionably.

14,060. What food usually does a collier have in Scotland when he is in full work?—He generally has the best food that the district can produce.

14,061. That is to say he has meat I suppose?—Yes.

14,062. Has he meat every day?—Yes, I should say so as a rule.

14,063. During these strikes has he been obliged to leave off meat?—Yes, and to steal potatoes. In the strike of 1842 or 1843 I have seen men going out ometimes in droves at night to steal potatoes.

14,064. During such a time of strike have you made any remonstrances with the men, and said to them, "Why do you continue the strike, we cannot do any-

"thing more for you"?—Yes, when I have had an opportunity.

14,065. What answer did they make?—Some of them would say that they were willing to commence, but that they dared not.

14,066. And when they said they "dared not," what did you suppose they meant?—They meant that the other workmen would have prevented them.

14,067. In what way; violently?—Well I believe that they would have tried first to prevent them without violence. But it is quite a common thing in the neighbourhood of Glasgow for a man to be prevented from working in the morning. Sometimes a deputation of two or three or four men are sent to each colliery to prevent the men from going down in the morning.

14,068. First of all you say they use what they I suppose would call moral suasion?—Exactly so.

14,069. But is not that moral suasion always accompanied with this sort of thing. "Now do not go down; "it is not for your interest to go down, but if you do "go down, why then ——"?—Exactly.

14,070. And that "why then" means violence in fact?—I believe it does.

14,071. (*Mr. Booth.*) In that long strike in Lanarkshire which you spoke of, did you take any steps to get men from other quarters?—We did eventually take steps, not to get men from other quarters, but to induce some of our old men to go in, and we succeeded to a small extent. They were in fact in complete starvation.

14,072. Were they interfered with by the other men, the men who were out on strike?—They were, but eventually they were all very glad to get in I believe.

14,073. (*Mr. Roebuck.*) A pinching belly compelled them to go into the pit?—Yes.

14,074. (*Chairman.*) Have strikes had any effect in depressing the trade after the men have resumed work?—No, I do not think that they have had any effect in depressing trade after the men have resumed work; but an effect was produced before the strike when the existing wages were higher than the trade could afford.

14,075. (*Mr. Roebuck.*) To whom do you chiefly sell your coal?—We ship a small portion of it, and we sell the rest to manufacturers and for household purposes.

14,076. During the strike, the manufacturer having no coal from you, did he go to other people to get coal?—Yes. Coal was brought from a great distance during that strike in 1856.

14,077. Then when you resumed work did you find that your customer came back, or did he stay with the person whom he had been compelled to employ during the strike?—Our customers could not leave us, because they were bringing coals from Newcastle at that time, where the stock was lying.

14,078. In fact, you could supply them more cheaply than anybody else?—Yes.

14,079. (*Mr. Booth.*) Owing to the circumstances of your colliery you did not, in fact, lose the market in consequence of the interruption?—No.

14,080. (*Mr. Mathews.*) The cost of the extra carriage from Newcastle and the other districts to which your customers resorted would soon bring them back to your collieries?—Yes.

14,081. How many hour do the men work for that 3*s.* or 4*s.* which you say they get?—From eight to twelve hours a day.

14,082. Do they work by a stint, that is, by so much, holing or hewing for a day's work, or what is the system?—In some parts of the country they have what they call a darg, that has the same meaning as your word stint.

14,083. How about your own collieries?—In some of my own collieries they have a set darg, and in others of them they have not.

14,084.—Where they have this darg, as you call it, how many hours a day do they reckon as a day's work?—That depends a good deal upon the character and ability of the man.

14,085. Taking an average man what would it be?—About 10 hours.

14,086. And for that he would get 3*s.* to 4*s.*?—Yes.

14,087. In case of a strike or any privation on the part of the men or their families do they go to their parish or get assistance from it?—No, they do not get any assistance from the parish as long as they are able bodied.

14,088. (*Mr. Roebuck.*) What was the number of hours that men worked when you began your business ife?—They worked very long hours.

14,089. Can you recollect the number?—They worked from 10 to 12 and even 15 hours a day.

14,090. And now you say they work how many?—I should say on an average 10 hours a day.

14,091. With regard to that shortening of the hours of labour, is that attributable to the action of the unions or to a feeling on the part of the masters, combined with a feeling on the part of the men; has it been brought about, in fact, by the unions advising the men?—I would not say that it has been brought about by the unions. I think that scarcely any good has been brought about by the unions. I think the Mines Inspection Act has been very useful in bringing about all these arrangements. It has made us a great deal more particular, and we rather vie with each other now who shall have the best-conducted colliery.

14,092. When you began your business life I suppose that women and children worked in the mines?—They did.

14,093. And that was prevented by Act of Parliament?—Yes.

14,094. Are you at all aware of any improvement in the manners and condition of the colliers since the prevention of women and children working in the mines?—Yes, there has been a gradual improvement in the condition and manners of the colliery population.

14,095. Are they mostly educated. Do they receive good school instruction?—Yes, we have all good schools.

14,096. When you began your business life did the colliery men partake of that good instruction which you are famous for in Scotland?—No, not then.

14,097. But they have done so since this Act of Parliament was passed?—Yes, they have been gradually improving in that respect, and I do not know any colliery district now without a first-rate school.

14,098. When you say "a first-rate school" have you any notion of the cost that it is to a man at one of those collieries to send one child to school?—About 2*d.* a week.

14,099. And for that what sort of instruction does the child get?—He gets English and geography and the usual elementary branches of education.

14,100. He reads, writes, and ciphers, I suppose?—Yes, he reads, writes, and counts, as we call it in Scotland.

14,101. What number of years does a child usually continue at school?—Unfortunately they are taken away too early from school. I do not allow them, if I can help it, to get into the pit before they are 12 years of age.

14,102. What is the limit by the Act of Parliament?—It is 10 under certain restrictions. They get away at 10 years of age if they can read and write. They get a certificate monthly or quarterly that they can read and write, or they attend school a certain number of hours weekly until they are 12.

14,103. From 10 to 12 years of age that is?—Yes.

14,104. I think you say that you have made it usually a rule not to let children into your pit until they are 12?—Yes.

14,105. Is that because their coming in was attended with difficult restrictions, or because you felt that it was not for the child's good?—It is because I felt it was not for the child's good. In special cases I allow it. If a family is very poor, or if a widow for instance

Mr. A. Hood.

21 April 1868.

has a very apt child that can read and write well, I permit it, but very rarely.

14,106. You say that the manners of the colliers have improved of late years. Has there been less violence in your district of late years?—Yes, much less violence.

14,107. I suppose that when you began there was a sort of brutality (I do not like to use a harsh word) about the manner of the men?—Yes.

14,108. Has that disappeared now?—It has to a great exent.

14,109. And you attribute that to the improved education they can get in consequence of the restriction of hours, and the prevention of women and children going into pits?—I think it is as much due to education as anything else.

14,110. But the education could not have been given under the old circumstances?—No.

14,111. (*Chairman.*) Has there been a greater improvement in the miners, do you think, than there has been in the other classes that live by daily wages?—No, I would not say there has.

14,112. There has been a general improvement throughout society?—Yes.

14,113. You say there has been an improvement since the Mines Inspection Act. Do you know to what influence you are to attribute the Mines Inspection Act; was it to the trades union men?—No, I do not think it was. I think that it was due to the general feeling of the public.

14,114. (*Mr. Roebuck.*) But how was that feeling raised?—I do not know how it may have originated.

14,115. There was a feeling at that time in the public mind of the impropriety and injustice of employing women and children in mines?—There was.

14,116. Do you know whether that was preceded by any attempt on the part of the leaders of trades unions to instruct the public in the injustice of the arrangement?—I do not know; I do not recollect so far back as that.

14,117. (*Mr. Mathews.*) Were there many women employed in mines in Scotland previous to the first Inspection Act?—Yes, a great many.

14,118. More in Scotland, if I remember rightly, than in all England put together?—None were employed in the west of Scotland, but in the east a great many were.

14,119. Who were the great proprietors in the east of Scotland at that time?—The Marquis of Lothian, the Duke of Buccleuch, and Mr. Wardlaw Ramsay, my landlord, and other small proprietors in the neighbourhood of Edinburgh. There never was a woman employed underground in the west of Scotland within my remembrance. I speak more particularly to the west of Glasgow where I was brought up.

14,120. About the employment of boys in mines, you employ no boy under 12 years of age as a general rule?—No.

14,121. But in certain cases where you find a steady boy who has been to school, and whose mother might be in some degree benefited by his labour, you employ him under that age?—Yes.

14,122. As a rule the Act has excluded all boys from the mines under 12 years of age?—Yes.

14,123. (*Chairman.*) Do you employ boys and women on the surface?—We do not employ women on the surface at any of our collieries.

14,124. (*Mr. Mathews.*) There is no restriction as to the age at which boys may be employed on the surface, is there?—No, I think not.

14,125. (*Chairman.*) What was the work of the women when they worked under ground?—They hauled the coal from the working faces to the pit bottom, and sometimes carried it up the shaft in baskets, or creels as we call them.

14,126. They were not employed in breaking the coal?—No.

14,127. (*Mr. Roebuck.*) What weight would the baskets be which they carried?—Some of them 2 cwt.

14,128. (*Mr. Mathews.*) Did they climb up?—They got up a ladder.

14,129. (*Sir D. Gooch.*) With 2 cwt. on their back?—Yes.

14,130. (*Chairman.*) Had you not machinery, and would not that be more profitable to the proprietors?—In some of the shallow collieries they have not machinery, and in some of the collieries in the neighbourhood of Edinburgh the coal seems to lie very steep on edge, and they had ladders up the strata; they commenced to work at the very surface, and then they went down and continued just as far as the women could carry the coals up.

14,131. (*Mr. Roebuck.*) Have they employed machinery since the women have left off doing that work?—Yes, they always do so now.

14,132. So that the necessity which was created by the women's absence led to this improvement of the use of machinery?—Not so much that as the increasing depth of the mines. Even now the women could not have been employed to carry the coals to the surface, the mines are getting so much deeper.

14,133. (*Mr. Booth.*) As far as your experience goes the authorities of the unions did not take any steps which led to the prohibition of the employment of women and children in collieries?—No.

14,134.—They confined themselves more to the question of wages I suppose?—Yes.

14,135. (*Mr. Mathews.*) What is about the rate of royalty to a ton of coals in Scotland?—I should say from 5*d.* to 1*s.* 4*d.*

14,136. I think you stated the wages of colliers and other assistant labourers to be three-fifths, that is 3*s.* out of the 5*s.*?—Yes, but in some cases the cost of wages will not be so much as three-fifths.

14,137. (*Mr. Roebuck.*) If you could give me the evidence I should like to find out all the items that go to make up the value of a ton of coal at the pit's mouth. First of all I suppose there is the rent of the mine?—Yes.

14,138. What comes next?—There is the labour of the coal hewer and other labourers.

14,139. Is there anything besides the rent of the mine that goes to make up the element of value in the coal excepting labour; have you any machinery for instance?—Yes, we have machinery, and there is the cost of sinking pits and providing oil, tallow, and timber.

14,140. And supervision?—And supervision.

14,141. When all those items are combined, excepting labour, what proportion do you think the amount bears to the whole value?—I should say very nearly a half of it excepting labour; but it varies very considerably.

14,142. What occasions the variation?—Some collieries have a much better roof to the coal than others. That is a very important item, where a thick seam is worked with a bad roof there is a very great expense for timber; sometimes as much as 3*d.* or 4*d.* or even more per ton. But I shall be glad to make up a statement if you would allow me to have time to do so.

14,143. (*Mr. Mathews.*) Give the rate of royalty, which you say varies from 5*d.* to 1*s.* 4*d.*, and given the cost of sinking the pits and the introduction of machinery and other charges of that nature, those are charges which you cannot vary at all, they are fixed and constant?—Yes.

14,144. The only charges you can vary are the wages paid for getting coal?—Yes, they are the chief ones.

14,145. And when there comes a reduction of 6*d.* a ton, or whatever it may be, in the selling price, it becomes a matter of absolute necessity therefore that the wages should be reduced?—Yes.

14,146. That reduction is one of absolute necessity from the exigencies of the case?—Yes.

14,147. So that in point of fact the coal master is a mere passive agent in those circumstances, and can exercise very little discretion of his own?—Yes, and

I believe no combination amongst coal masters could prevent a fall in the price.

14,148. So that any advice that the officers of the unions may give to colliers to resist the reduction of wages rests upon a fallacy which is untenable and can by no possibility succeed?—No doubt of it.

14,149. (*Mr. Roebuck.*) I do not know whether I am going to ask an indiscreet question, but what in the trade is considered the ordinary and proper rate of profit on capital employed in the coal trade?—I do not know that I could answer that question directly. I do not know that there is any exact per-centage, considered to be the proper thing.

14,150. There must be something in your mind that determines you to say that you cannot afford to sell coal at a certain rate; that means that you cannot turn your capital and make the ordinary profit that is required to induce you to go on with it. What I want to know is what is considered in the trade the ordinary and proper rate of profit for capital employed in that way?—I never heard any person name what he would consider the proper rate. I know that some of them work with a very small profit, perhaps so low as 5 per cent. It may vary from 5 to 20 or 30 per cent. on the capital, and occasionally we lose as much. If you were to ask me the question how much any individual concern may have made for a series of years I might be able to answer it.

14,151. That is a question that I should not dare ask?—And I do not know that I would answer it.

14,152. (*Mr. Mathews.*) You consider the coal trade, of course, to be one of very considerable uncertainty as to its results?—Very great uncertainty.

14,153. But you would be satisfied, I presume, in taking your lease upon a royalty and making the necessary outlay if you could be quite sure of 10 per cent. or even less on the capital?—Yes.

14,154. Do you think that the Scotch coal masters, as a rule, get more than 10 per cent.?—I do not think they do.

14,155. They do not get more than 10 per cent., you think, taking the whole of their losses into account, even if they get as much as that?—I do not think they do.

14,156. (*Mr. Roebuck.*) Has there been any attempt in your part of the country to associate the working men with the proprietors of the mines in the working of the mines through a system of participation in the profits?—No.

14,157. You have never heard it suggested?—I have suggested it myself to our workmen.

14,158. What have they said?—That they would rather work away as they were if I would give them what they wanted.

14,159. That is to say they would like the profits without the risk, but they did not want to indulge in the expectation of profits with the risk?—Just so.

14,160. (*Chairman.*) Are you at all acquainted with the co-operative mines?—Yes, I have looked at the results occasionally of some of the co-operative mines in England.

14,161. It is an advantageous thing for a working man to belong to them, as I have always understood, because he has a share of the profits?—Yes. When I proposed it to our men they said that they were willing enough to take a share of the profits but they did not see their way to bear any proportion of the losses.

14,162. (*Mr. Roebuck.*) Do you know any case in Scotland in which that co-operative system has been introduced in the working of mines?—No, not in the working of mines. We have had it very successfully introduced in the stores, and at one of my own collieries we have a very successful store for supplying the workmen with all the necessaries of life. It answers very well in that case, but I do not believe that it would be successful generally in the working of mines, or in any manufacture whatever.

14,163. (*Mr. Booth.*) Is that a co-operative store?—Yes, a co-operative store.

14,164. Carried on by the men themselves?—Carried on by the men themselves. I give them every assistance they require, and encourage it as much as I can; and it has been very successful.

14,165. Still it is entirely under their control, I suppose?—It is entirely under their control.

14,166. (*Mr. Roebuck.*) What goods do they sell?—Almost everything the men require.

14,167. Do they sell meat, for example?—They do sometimes; they get a butcher to supply the members at so much per cent. less than the usual selling price.

14,168. And groceries, I suppose?—They have a regular shop for groceries and cloth; and beer we allow them to sell. We do not allow them to sell whiskey.

14,169. Do you allow them to take beer into the pit?—No.

14,170. (*Mr. Mathews.*) It is a ready money establishment, I suppose?—It is a modification of a ready money establishment. They purchase so many shares in the store, and they get goods to the amount of those shares.

14,171. In the event of a strike or any privation among the colliers, do they get any assistance in the way of credit from these co-operative stores?—No.

14,172. Where there are small shops supplying the people, is it the custom of those shops to give the workmen credit during a strike, or when they are out of work?—Yes.

14,173. That advantage then the workman is entirely deprived of if he is a member of one of these co-operative societies?—Yes.

14,174. Therefore, though they may be of great advantage to him when he is getting good wages, they are of no advantage to him when he is not?—Just so.

14,175. But then the open shop is a great advantage to him and keeps him out of the workhouse for a great number of weeks, perhaps, by the assistance it renders him?—Yes.

14,176. (*Mr. Roebuck.*) Do you call that assistance a benefit; does it not continue the strike?—I think that it is no real benefit, but that the co-operative store will have a very good effect in preventing strikes, because the men must know that they have no credit, there and that if they strike they cannot get anything from the co-operative store.

14,177. (*Mr. Mathews.*) The advantage of the co-operative store is that it rather deters men from striking from the consciousness that they can get no assistance if they strike?—Yes.

14,178. On the other hand, if a man is thrown out of work for want of work or accident the open shop gives credit, so that it has its advantages too?—Yes, but I do not think it is any advantage for the men to have the means of striking.

14,179. (*Chairman.*) Have you had experience of combination among the employers for the purpose of keeping up prices?—Yes, I have, and I do not think they have ever been fruitful of benefit to anyone.

14,180. (*Mr. Mathews.*) Whenever the masters attempt to keep up prices in the face of a depressed condition of trade under the notion that it operates upon the price of coal, it is generally an entire fallacy upon the part of the masters?—Yes, generally.

14,181. The regulation of the price is beyond their reach in fact?—Yes.

14,182. (*Mr. Roebuck.*) Has that combination amongst masters existed to any extent in your part of the coal country?—Not that I am aware of. I have never been called upon to enter into it to any extent.

14,183. And when it really did exist what form did it take; did the masters enter into any understanding with each other?—Sometimes it was for the purpose of regulating wages and sometimes for regulating prices, and in every case our combinations have completely failed.

14,184. Did they ever enter into combinations for the purpose of resisting strikes?—Yes, I believe we have done so.

14,185. Did those succeed?—No, we had all to act separately and individually in the matter to a very great extent. It was the interest of every individual to resist these strikes, and therefore we succeeded in reducing the men.

The witness withdrew.

Mr. P. Cooper.

21 April 1868.

Mr. PHILIP COOPER examined.

14,186. (*Chairman.*) I believe you are a coal-master at the Holmes Colliery?—I am the general manager of it.

14,187. Is it an extensive work?—We employ upwards of 500 workmen and raise from 3,000 to 4,000 tons of coal a week.

14,188. How long have you been the manager of it?—About six years.

14,189. And had you experience before that?—Yes, in the north of England, in Northumberland, and Durham.

14,190. (*Mr. Mathews.*) Do you come in contact with these trades unions in the coal trade in your district much?—Yes, in Yorkshire they are very strong, and our colliery is included in the district.

14,191. There is a larger extent of trades unionism in Yorkshire than you had in Northumberland when you were there?—Very much so.

14,192. You had not much in Northumberland had you?—We had unions occasionally, but they never lasted long.

14,193. How long have you been in Yorkshire?—About six years.

14,194. And during that time the unions have been very active in your district?—Yes, I think during the whole of that time.

14,195. When was the last strike at your colliery?—We have not had any general strike at our colliery except for a fortnight, I think, in 1864. The colliery was then new and small, and we had a strike of something like a fortnight only, but in the district there was a strike of many weeks, 20 I think.

14,196. What did the strike arise from, was it from an attempt to reduce wages or a demand for an advance on the part of the men?—I think it was a demand to increase wages for this reason—the way that we avoided the strike at that time was that we gave provisionally an increase, subject to the increase that might be given at other collieries when the matter was settled.

14,197. So that your policy was to wait and see what the result of the strike was at other collieries?—Yes, we were new, and winning the pit out, and did not wish to be stopped.

14,198. Was the strike at the other collieries owing to a demand on the part of the men for an increase of wages?—My impression is that it was; I have no doubt indeed that it was.

14,199. What is your impression of the cause of a strike generally; does it arise from a demand for an increase on the part of the men, or from a notice on the part of the masters to reduce wages?—I am not aware of any attempt to reduce wages, except the attempt which is being made just now, and which is not settled. We have called the men together to recommend a reduction on account of the state of trade and if they do not agree to it it will be considered whether we must not give them notice.

14,200. There is no strike existing now in fact?—No.

14,201. Have you come in contact with the unions in your attempts to reduce wages in Yorkshire?—Yes, we always have the interference of the union in cases of dispute. The men are in the union, and any general question is not settled without a reference to the leading persons in the union.

14,202. Are all your men in the union, do you think?—I believe principally at the present time.

14,203. And whenever there is an agitation for an alteration of wages, either lowering or raising them, they generally refer to the officers of the union, and are guided by their advice and direction, are they?—Yes, I think so.

14,204. (*Mr. Roebuck.*) When the officers of the union are not amongst your working men, do you still communicate with them?—We do not exactly communicate with them, but they communicate with us; that is to say, on being requested we confer with them—we meet them at the colliery on the subject in dispute.

14,205. You meet and discuss with the men outside of your pit who do not work for you, and negotiate with them about your own pit?—Yes.

14,206. So that you allow the interference of the trades union in the working of the pit?—We suffer it, not by preference exactly.

14,207. Have you felt any mischievous effect from that interference?—I should say generally not, because I think that when it has come to be a matter of some importance in dispute, and the leaders of the union apart from our own workmen have interfered, the matter has been settled without a strike, when perhaps otherwise it would have ended in a strike.

14,208. And that you attribute to the influence of the union?—No, I attribute it to the influence of having the thing fairly stated by those who have the power to say whether the men would be supported in case of strike or not.

14,209. In those individual cases you suggest that the union has prevented strikes, and not created them, as I understand you?—No, I suggest this, that by our having a conference with the leading men of the union—with the secretary of the union, say—he has had a more clear understanding of the nature of the dispute than he otherwise would have had, and has been able to use an influence with the men to prevent them from striking; the influence of advice and counsel in some cases, and perhaps a hint that they would not be supported by the union in such a course.

14,210. Then it comes to what I said, that you in that case attribute the beneficial influence to the working of the union?—Well, I have no doubt that it has prevented in certain cases with us a further cessation of labour when it has existed, and has prevented it from beginning in other cases.

14,211. (*Mr. Mathews.*) What is the selling price of coal now at your collieries?—It depends upon the kind of coal, to begin with. The slack coal of course is sold for less than the rest—that is 3*s.*; house coal for 6*s.*, and hard coal for 7*s.* per ton, at the pit's mouth.

14,212. Taking the portions all together, what would be the average?—Perhaps 6*s.* to 6*s.* 3*d.* or 6*s.* 6*d.* per ton of 21 cwts.

14,213. Have you any control over the circumstances that regulate the price of coal?—No, exceedingly little.

14,214. If the price of coal is disposed to go down, owing to a bad trade or a falling off of consumption to any material degree, you cannot prevent the price of coal so going down?—No, we have no means of controlling that.

14,215. On the other hand, when there is an extra demand for coal, all the collieries very soon find that they have more demand than they can supply, and they naturally raise the price?—Yes.

14,216. When they raise the price does it end in colliers' wages rising in the same proportion?—It has done so in Yorkshire of late.

14,217. And when the market falls you reduce the wages in the same proportion, I suppose?—We are now trying to do so.

14,218. And if you do not succeed what will be the result?—We shall either be compelled to stop or to work at an absolute loss.

14,219. And you would not go on at a loss long, I suppose?—Not if we can help it.

14,220. So that a falling market and reduction in the rate of wages is infinitely more to the disadvantage of the coal-master than it is for him to raise the wages and raise the price of coal?—Certainly.

14,221. You find that the coal market is very little influenced by any combination on the part of the coal-masters themselves to raise the price or keep it from coming down?—I believe it is beyond our control.

14,222. And the rate of wages is compelled by circumstances to be regulated by the price of coal?—It ought to be.

14,223. And it is in point of fact, is it not?—It is in advancing, but we have not always found it so in reducing. I have in several cases found that coal-

owners would rather bear the loss, and did bear it, if they thought it was temporary.

14,224. That is to say, there is always an unwillingness on the part of the coal-master to reduce the wages of the workmen if he thinks there is any prospect of the trade recovering itself?—Yes.

14,225. If he sees that the state of trade is such that there is a probable prospect of a rise in price there is no disinclination on his part to raise wages, provided he can do so securely?—I think not; indeed we should always be more ready to raise the price of wages with an advancing market for selling coal than to reduce it.

14,226. In order to keep the collieries at full work you mean?—In order to keep the collieries at full work.

14,227. So that, in point of fact, your experience is, that on the one hand the masters have very little influence in retarding a fall in the price of coal, or in causing an advance, and that on the other hand the workmen also have very little influence?—I believe the influence that either can bring to bear on the matter is temporary, and is over-ruled in the end by more certain rules of trade.

14,228. What is the average rate of royalty to the landlord payable upon coals in your district?—It differs very materially, but for the Barnsley bed it is something like 1*s.* a ton.

14,229. And that 1*s.* a ton you cannot alter, of course?—No; whatever the state of trade is that remains the same.

14,230. And what proportion of the residue do you think consists of workmen's wages that are influenced by fluctuations according to circumstances?—Including the royalty I should say something like 60 per cent. as wages.

14,231. And the remainder would be royalty and common charges?—Yes; that leaves 40 per cent. for the royalty, and material, and other charges for the maintenance of the pit, and so on.

14,232. Which are not materially affected by a rise or fall in the rate of the colliers' wages?—Which are not affected by the rise and fall of prices at the colliery, but are charges for work done by manufacturers, and for the keep of horses, and so on.

14,233. (*Mr. Roebuck.*) Who is the proprietor of the Holmes Colliery?—It is a limited liability company, consisting principally of gentlemen of the neighbourhood.

14,234. (*Mr. Booth.*) I think you said that your interviews with the officers of the unions have sometimes been useful in settling the differences between the workmen and yourselves, and in preventing a strike?—I believe so.

14,235. Had the unions anything to do with bringing about those differences in the first instance?—I think that what I should call the general union had not anything to do with it, but the mere local lodge in which our own men were. I should think that the first steps were not taken by any arrangement of the general union.

14,236. What were the subjects of dispute in the case to which you refer?—They were various.

14,237. Questions of wages?—Sometimes wages; an application for increase of wages which was not general in the district, or which was confined, say, to our works; some special advance of wages.

14,238. Had the unions anything to do with suggesting that advance of wages originally?—When it was a general advance applied for in the district they had, no question about it; but what they do in other isolated cases I cannot say. I believe that as far as our own place is concerned the application for an advance has been made without the concurrence of the principal leaders of the union in the district, I mean their council, or general committee, or whatever it is that manages their affairs, and that it was a local thing got up by the men themselves.

14,239. You think your intercourse with the officers of the unions has led to the adjustment of those differences?—Yes, I think sometimes they have prevented, too, a further cessation of work, the interview leading in too many cases to very large concessions on the part of the employers.

14,240. Do you think that it was to the advantage of the employers that there should be that kind of intermediary between you and the workmen?—That of course is a very wide question. I do not believe that these unions are beneficial to anybody, either workmen, or the public, or employers. I believe that they are injurious in the end, but I believe that under the peculiar circumstances of a strong union, such as that existing in South Yorkshire, the policy of any colliery manager refusing, in case of dispute, to meet the secretary, or the committee, or other persons requested to meet him, who did not belong to his own works, would be a suicidal policy on his part; that it would lead to those persons having only the statement made by the workmen, and not knowing the facts of the case, and probably sanctioning and supporting a strike which otherwise they would not do. And to that extent it must be beneficial to meet the officers of the union.

14,241. But supposing there had been no such union in existence, do you think that there would be any difficulty in settling your differences with the men?—I think not. I think there would be less than there is in the case of the union existing.

14,242. (*Mr. Mathews.*) In case of your refusing to see any officers of the union who might wish to communicate with you, and restricting it to men in your own employ, what steps would the officers of the union take with the men to interfere with their work?—I think that if they believed their statements and approved of what they wanted they would support them, in the event of a strike.

14,243. (*Mr. Roebuck.*) In what way would they support them?—By paying them a weekly allowance.

14,244. Have you ever known any violence on the part of persons attempting to keep them from going down the pits?—Frequently; indeed a great source of contention at our works has been the demands of the men to force men to go into the union. We have always held ourselves neutral, and very frequently they have laid the works idle because a few men were not paying into the union, or because they were in arrears with their payments. Not only that, but they have come and asked more than once that we should compel men to subscribe to the union, or else not employ them, or that we should promise not to employ any man without asking whether he would pay into the union. However, in all these cases I have steadily refused interfering with the union in one way or the other, so far as regarded trying to induce any man to join or not join, to pay or not pay, to the union.

14,245. Did they ever ask you to pay a man's arrears?—No, I think not. They have asked us to make the men pay up their arrears or to discharge them, but they have not asked us to pay up the arrears themselves. I think that has not been done in the coal trade, though it has been done in other trades in the neighbourhood.

14,246. (*Mr. Mathews.*) When they have asked you to compel other men to join the union and you have refused, has the result been that they have proceeded to call out your men?—For a little time, a day or two; indeed at one time for weeks together we were idle I should say one day a week, solely on account of men not paying to the union. The fact is, that at the beginning of the union, at our works, they had to force the men into it; a few joined by the influence of other men outside, and then these few used to place themselves at the pay office door on the night of the pay, and by threats and violence they compelled men to pay that were not in the union at first.

14,247. (*Mr. Roebuck.*) Have you ever known a case of a man being ill-used for persisting in his refusal to pay?—Yes, one was seriously ill-used on the colliery premises in returning from his work.

14,248. (*Mr. Mathews.*) So that you would infer from that fact that the men are rather unwilling sub-

Mr. P. Cooper.

21 April 1868.

scribers to the union, and that they subscribe only because they are afraid of being ill-used if they do not?—I believe that throughout the whole district a large proportion of the men would rather not join, but they do it for peace and quietness sake.

14,249. (*Mr. Roebuck.*) They do not in fact like to work with men who are at strife with them?—No.

14,250. And on that account as well as from fear of violence they pay, in order to have a quiet world?—Yes, but they have good reason to have the fear of violence because they have been subjected to it so often during the last four or five years. When this man was seriously ill-used the pit was laid idle. His eyes were injured and his head was broken, and the men who took part in it were prosecuted and committed; several other persons have been illused.

14,251. (*Mr. Harrison.*) Was there any evidence in those cases that that misconduct had been sanctioned by the officers of the union, or that it came before the governing body in any-way?—Not the general union; at least I have no reason to believe that the general union sanctioned it, though in some cases the leaders of the local union, that is to say, the men at our colliery, were not averse to it, but rather in favour of it. Indeed some of the leading men were prosecuted for taking a part in it. But I have no reason to think that the officers of the general union had anything to do with it in any way.

14,252. (*Mr. Roebuck.*) The general officers were at a distance I suppose?—Yes.

14,253. (*Mr. Harrison.*) Was there any evidence that it was in consequence of any declaration come to at a union meeting, or that it was a thing regularly commissioned to be done, sanctioned by the society in fact, before hand?—I believe in this particular case the men not paying, and that sort of thing had been discussed at a meeting of our own workmen (I do not refer to the general outside union), but I am not aware that there was any resolution that they should do anything to him. But the thing was discussed generally, and the man's conduct was disapproved of because he would not pay.

14,254. (*Mr. Roebuck.*) I suppose that your men are all shrewd Yorkshiremen, are not they?—I fancy that half of the colliers in Yorkshire are not Yorkshiremen, and very few of our men are Yorkshiremen.

14,255. (*Mr. Booth.*) Were any steps taken on any of these occasions by the union to express their disapprobation of any of these violent proceedings?—No, on the contrary they found the money for the defence of these persons who were prosecuted, and kept their wives and families while they were in prison.

14,256. So that they did virtually sanction what had been done?—I think so—I mean that they did so locally. I do not mean to speak for the general union, because I have no means of knowing that.

14,257. (*Mr. Roebuck.*) Let me direct your mind to the general union. You say that you do not think that they sanctioned these proceedings?—I say that I have no means of knowing.

14,258. Do you think that men of that sort would do so foolish a thing as to inculpate themselves by any declaration that they might make on the occasion? do not you think that they are shrewd enough to get the thing done without endangering themselves?—Yes, but I do not think that there was any formal arrangement to do any mischief.

14,259. (*Mr. Harrison.*) Do you suppose that the authority of the central union, which now exists at Barnsley, for instance, had anything whatever to do with this act of violence in arranging it beforehand?—No, I think not. I have no reason to think so.

14,260. (*Mr. Booth.*) Can you call to mind any case in which a rise of wages was brought about through the intervention of the union, in which in your opinion that rise would not have taken place at least within a short period supposing the union had not interfered; I speak of a permanent rise of wages?—Yes, we have frequently had to make advances within the last four years that we should certainly not have made had it not been that we as a single colliery seemed to have been selected to be applied to for an advance, and we considered that if we refused it then inevitably we would have to fight the whole union. The consequence was that we submitted to what we considered in many cases, and do yet consider, very unreasonable advances, for the sake of preventing our colliery from being suspended entirely.

14,261. Have those advances been permanent?—They are permanent to the present time, and I do not know whether there is any prospect of their being taken off.

14,262. Have similar advances taken place in the neighbouring collieries?—At several of them.

14,263. (*Mr. Roebuck.*) Then, *pro tanto*, the men have received an advantage from the existence of unions?—I have no doubt that they have in some cases in the increase of the rate of wages, but not in the increase of the actual amount of earnings.

14,264. (*Mr. Mathews.*) That rise of wages may have even caused a loss for the time?—No question of it. I have always found that every increase in the rate of wages, piece-work wages, tonnage prices, and yard prices, leads to a greater reduction in the amount of labour performed in proportion, and that the men actually make less wages than they did before with the less rate of pay.

14,265. (*Mr. Roebuck.*) You mean that they do less work?—Very much less work; and work fewer days.

14,266. And what money they get they get at a less expense of labour?—Yes, they earn less wages altogether.

14,267. (*Mr. Mathews.*) And they effect that rise in wages by fixing on some one colliery at which to strike while the men at the other collieries continue at work and support those on strike?—I do not say that the union generally do it, but I say that our men make a proposition that they shall have something, the general union hear what they have to say and they believe their statement, or perhaps it may be that it is a necessary part of their policy not to restrain the men on every occasion of an application being made, though they may think them unreasonable, but that they should sanction it and furnish them support. I suppose in that case if we thought that a strike would be the result and that we should have to fight the whole union ourselves, while the other collieries were working to support the men on strike, we should certainly, if it was possible, yield the point rather than have a strike.

14,268. That is taking for granted the probability that the men would have the support of the union funds if a strike took place?—The certainty of it in the South Yorkshire district. In a very large adjoining works they were out of work very nearly three quarters of last year through some dispute sanctioned by the union.

14,269. (*Mr. Roebuck.*) What colliery was that?—The Chapel Town Colliery.

14,270. Belonging to whom?—Belonging to Mr. Chambers.

14,271. (*Mr. Mathews.*) The operation would be this. The men having given you notice for an advance of wages, if you refused to give that advance of wages the unions would support those colliers out on strike for an indefinite period?—Yes.

14,272. And they might have the power of stopping your colliery altogether and ruining it?—Yes, with a limited number to support and 7,000 or 8,000 paying members they could go on any length of time supporting that limited number as well as if they were employed.

14,273. So that if one colliery were victimized they would gain their object by causing a conviction in the mind of the master, "If I do not give way my colliery will be ruined"?—Yes.

14,274. (*Mr. Harrison.*) Have you known that the central authority has originated a strike, say at your own works, without any suggestion of the kind coming from your own men?—No, on the contrary; I said that the question very probably began with our own workmen, or the workmen of the individual

colliery, in the first instance. I am not aware of any arrangement of the central authority of the union that they would attack any particular colliery or that the men should do so; but the thing has worked itself out in that form; the men have made an application and the leaders of the union have thought it was right that they should make it, or that they should support them, and the consequence has been that you have had to fight the whole union as one isolated colliery.

14,275. (*Mr. Mathews.*) Even if they do not originate it, the fact remains that the whole union sanctions the strike of your men and supports them?—Yes.

14,276. You do not want legal evidence, because you have the fact before you that they contribute to your men on strike?—Yes.

14,277. If you wanted to get legal evidence it would be almost impossible to get it, I suppose?—It would be almost impossible to get it without the aid of the delegates or some of their officers, which is not likely.

14,278. (*Mr. Harrison.*) I understand you to say that something of this kind occurs. The men at a particular pit, say your own, think that the time has come when they should have an increase of wages, and they then communicate with the other members of the union to ascrtain whether they would be supported. That demand is considered, and sometimes it is admitted and sometimes it is not admitted?—Perhaps before they communicate with the leading union they have made the application and given notice to leave.

14,279. Then they have taken the step themselves?—In the first instance, I quite believe so in most cases. I have no reason to believe that the leading members of the union have selected any one colliery to try that policy which I have described, but the thing has worked itself out by the operation of the men and other circumstances bringing it to bear in that form, and the result has been a considerable advance in prices. And I believe that that has restricted the development of the Yorkshire district very much. During the last six years I believe that the Yorkshire district has only increased about 5 per cent. in the output of coal.

14,280. (*Mr. Mathews.*) The unions have been more rife in the South Yorkshire district than they have been in other parts of England?—I believe they have during that time.

14,281. And more mischievous, in your opinion?—They have in several ways increased the cost much more than the increase in the rate of wages, and restricted the quantity, and by their doing so, and laying the pits idle, the result to Yorkshire is that the output there has only increased in six years 5 per cent., while the average increase of the country has been something like 25 per cent., and in the immediate neighbourhood in Derbyshire, where there is no union, there has been upwards of 20 per cent. increase in the six years ending with 1866.

14,282. You infer from that that the union interference is as prejudicial to the men as it is to the masters?—I believe so.

14,283. (*Mr. Booth.*) Supposing that the natural increase in the output had taken place, there would have been a consequent rise of wages?—Yes, ultimately.

14,284. And the men would have got the advantage without a union?—Yes, as the natural result of the state of trade, instead of its being forced when trade could not bear it. I do not think there is any fear of wages lagging behindhand when trade is good.

14,285. Then, under the ordinary state of things, the advance would have been gained without the unions?—Yes.

14,286. But I asked you just now whether on the occasion when you yielded to the representation of the union in order to avoid a strike, that rise of wages would not have taken place of itself, and I understood you to say it would not?—I referred in that case to special advances of a very objectionable character, but as regards general advances in the trade and a general improvement in the rate of wages I think that in the natural state of improving trade they would rise independently of any union.

14,287. That is, that the men who succeeded in getting the rise would have got it even without that kind of violent proceeding?—Yes, in regard to the general advance; but I speak more particularly with reference to exceptional advances, such as selecting one particular colliery for something out of the usual rate of payment. In that case ordinary improvement in trade would not have gained it, because we hold that the thing was unreasonable in all states of trade.

14,288. It might not have taken place so soon, but if I understand you, in the development of trade it would have taken place without the intervention of any union?—A general increase in payment, but not the special advances for local and special things.

14,289. Not those immediate advances I suppose you mean?—What I refer to is something like this. You have in the ordinary state of trade an improving demand for coal, and consequently you have an improving price, and you are anxious to get more coal, and the wages are very freely raised. But what I call the objectionable advances are advances asked for sometimes I think with the policy in view of preventing your working an increased quantity of coal. Now we have had to submit to payments which I think exceedingly objectionable, and which the ordinary improvement of trade ought not to have produced, and would not produce in any case; that is to say, payments to men working under special circumstances. We are paying at the present time 30, 40, and even 50 per cent. more than we were paying four years ago for certain kinds of labour, labour that is necessary to the development of the underground works. Very frequently in collieries, indeed almost constantly (and with the view I think in some cases of restricting an increased quantity of coal being raised,) we have been asked prices, and had to submit to and pay prices that I think are excessively unreasonable; prices that have enabled those particular men to make more wages by 30 or 40 per cent. than the average rate of wages in the colliery, and I think that those rises would not have been effected by a natural development of trade.

14,290. Will those prices be permanent?—I do not know I am sure.

14,291. (*Lord Elcho.*) You speak of some particular kind of labour in some particular kind of work; what kind of labour and what kind of work do you refer to?—Ordinary coal mining, but under peculiar circumstances.

14,292. What peculiar circumstances?—The coal, as you are aware, is quite solid, to begin with, and we have to make our way into that coal, by exploring or winning drifts. In doing that it is very frequently necessary to press the working of these drifts forward so as to enable the men to go on safely with the ordinary coal working. In that case you may wish perhaps instead of working one shift per day of eight hours to work in these places two or three of eight hours, or four of six hours. Now that is usual more or less in most collieries, but in our particular case we have had to pay an exceptionally high price, a higher price than ever was known in the coal trade in any part of this country, no doubt.

14,293. Are there any peculiar circumstances attached to your colliery that render that high price necessary in your colliery, but not necessary in others?—No.

14,294. (*Mr. Roebuck.*) Then under those circumstances do not you think that it would be fair on the part of the persons who advocate trades unions to speak to the men and say, "Now, here we point you out "one matter in which we have done you benefit, in "which you have got an increase which you would not "have got but for our assistance," and is not that to the working men an argument *pro tanto* in favour of trades unionism?—I have no doubt but that the result of a firm combination by workmen is an advance of prices, or a reduction of labour in times when trade is good, but in times when trade is bad such combinations become utterly powerless.

Mr. P. Cooper.

21 April 1868.

14,295. In those times when trade is good would not the rise have taken place without the aid of the union?—General advances would.

14,296. But you point out particular instances in which there would not have been a rise without the aid of the union?—Exactly so.

14,297. Then under those circumstances do not you think persons justified when they speak to the working men in this way; "We point you out here an advan- "tage derived by you, a working man, from the "union"?—Yes, I have no doubt of that, and I have no doubt also that these little matters are brought about in a measure to show that the union does good, that is to say, these little things are pressed with the object of showing that unions really bring some benefit to the workmen; and for the purpose of restricting production.

14,298. (*Mr. Harrison.*) This special work which you have been speaking of is in reality overtime, is it not, either work at unusual hours, or for an unusual length of time?—The whole of it is piece work to begin with. It is not overtime, but there are perhaps two sets of workmen employed in succession in the same working face instead of one set.

14,299. It is work at special hours, at night for instance very often, is it not?—That is not so in the case of two sets of men per day. In some parts of this country, in the north of England, for example, the constant and ordinary state of things is, to have what we call two shifts or two days work performed by different workmen in one place, in succession.

14,300. You tell us, as far as I understand you, that for a special kind of work you have had to pay 40 and even 50 per cent. extra; that is work different from the ordinary work for which you pay the other rate; the work upon which you pay these advanced rates is in reality work at special hours, and where you are going on the whole 24 hours is necessarily work through the night, and therefore you would naturally pay more for it, would you not?—No, it is not the custom in the coal trade to pay more for night-work; there is always a large number of persons working during the night.

14,301. (*Mr. Roebuck.*) Does it make any difference to a man working in the dark whether it is night or day?—No; it reduces the risk by reducing the number of men in the pit at one time.

14,302. (*Mr. Harrison.*) The union has introduced that custom of requiring an extra rate of payment for work under these conditions?—Yes; for the purpose of restricting the production.

14,303. It is overtime is it not, in fact?—Not in the sense that the men work a day and a quarter for a day.

14,304. It is work done at different hours from that of the other men?—Some of them; they do it alternately.

14,305. I think your evidence is that on the whole the effect of the union operations has been to reduce the amount of time which is worked, that is to say, to reduce the hours even where at the same time you think that the wages earned on the whole have been raised?—That the rates of payment have been raised and the hours the pits work coal per day at the same time reduced, and consequently the cost increased beyond the increase of wages.

14,306. As a rule in your district the union men work rather shorter hours, do they not, than in some other districts, Lancashire, and Wales, and Derbyshire, for instance?—I believe in South Yorkshire the men work as short hours as they do in any district except it be in Durham. I believe that in all other districts of this country the men work much longer hours than they do in Northumberland, Durham, or Yorkshire. It has been the custom in Durham for eight hours or less to be a working day for a man ever since I can recollect. In Yorkshire now the rule is for a collier to work about eight hours or less. In Lancashire they work longer, and in Derbyshire they work longer, and in Scotland I believe they work very much longer. And indeed I believe that generally in this country, except in Northumberland, Durham, and Yorkshire, the hours are longer.

14,307. You said just now that on the whole you believe that the rates of wages would have risen with the natural increase of the trade without the influence of the union. Do you think that at the same time the hours of working would have been also reduced by the operation of the same natural law?—Yes. I speak from experience when I say that I have known more increases of wages without any union whatever, and more reduction of hours without any union whatever, than I have known during the existence of a combination in the same district.

14,308. In what district was that?—In Northumberland.

14,309. What reduction of hours took place there?—In Northumberland the hours have been gradually reduced within the time of my own connexion with colliery matters, that is, during the last 25 years, from something like what they are in Scotland, namely, twelve hours or so, down to eight hours for a man as a positive rule, and for boys especially the hours have been greatly reduced.

14,310. That has been under the influence of legislation so far as the boys are concerned, has it not?—No, I believe it was only confirmed by legislation, and extended to other districts besides Northumberland and Durham.

14,311. Do you mean that the labour of boys was common in other districts before that time?—Yes.

14,312. But there has been combination among the colliers in those countries from time to time for the purpose of obtaining those objects, has there not?—Yes, for limited periods of time, but I do not recollect at the present moment one case where any combination of the workmen leading to a general contest with their employers in the north of England was successful. In all cases where a determined resistance was decided upon by the employers, they have fought it out till they succeeded.

14,313. But do you think that the existence of combination in some form or other, has had nothing whatever to do with reducing the hours?—I think it is possible, indeed I think it is probable that combinations may have had something to do with it, still I do not think they have been the cause, I do not think that combinations were the cause of removing women from working in the pits. They never did within my recollection, or long before that in the North of England, either work in the pits or on the surface.

14,314. But the association that existed at the time of the agitation used all their efforts to obtain that end, did they not?—I have no doubt, speaking to the best of my recollection, that unions have always advocated less work and more pay.

14,315. (*Mr. Mathews.*) Was not the suspension of the employment of women in collieries the result of a commission of inquiry issued by the Government?—Not in Northumberland and Durham.

14,316. But the Act that prohibited the employment of women in collieries was the result of a commission of inquiry issued by the Government?—Yes.

14,317. (*Mr. Harrison.*) Are the great bulk of the men who work in your pits at the present time members of the union do you believe?—I believe they all are. I believe that if we had any that were not paying regularly we should hear of it.

14,318. I suppose you have had some experience either there or at other collieries of men not members of the union?—Yes.

14,319. Judging from your experience at that time, do you say that the men you now have at your pit, for instance, are at all inferior as workmen to the non-unionists whom you have had to deal with?—I think they are as good, I have no reason to find any fault with the men generally as regards their being good, well qualified workmen.

14,320. Do you find that they are difficult to manage and insubordinate—I am not speaking of a case where there is any question of dispute, but in the ordinary working of the pit?—There is decidedly a great difficulty in maintaining discipline in the mine. If a person has been doing anything wrong, for example, and he be punished or dismissed for it, perhaps you have the pit laid idle a day or two (which

men themselves coming to know why this man was dismissed, and you have to defend yourself by giving your reasons, and then you have Mr. Normansell, as secretary, coming to see about it, and the whole thing must be gone into, and in the end it comes to this, that the man was properly dismissed for some insubordination or something of that sort. But in almost all cases of discharging a man we have that opposition, they always seem to think that it is because he is a union man, either a leader or a member of the union, that he is a victim, and you may set on any number of men you require, but you must be exceedingly cautious in South Yorkshire at the present moment before you discharge one man. You must be sure that that it is not only a case where the man ought to be discharged, but a case that can be clearly set before your men, because you are sure to be brought to their bar.

14,321. (*Mr. Mathews.*) If they did not approve of the reasons you gave for discharging the man, what would be the result?—I have no doubt the result would be that he must be re-employed.

14,322. Supposing that you did not choose to re-employ him, what then?—Perhaps the colliery would be stopped.

14,323. It resolves itself into this, that the master is deprived by these unions of the power of discharging any man except on giving satisfactory reasons to the union why he discharges him?—Yes, he must be very particular indeed how he does it.

14,324. (*Mr. Harrison.*) Do not you think that that sometimes works very well?—I think that it works very well for a man if he chooses to be a bad workman and a badly behaved man, because it may preserve him in work when he might not got it otherwise, but I think that it has a bad effect to have everybody master and nobody master; everybody doing what he likes. In a coal mine especially the effect is bad, because there is greater jeopardy there from employing unfit men. And, moreover, the nature of the employment is such that it requires strict discipline. The men are employed apart from each other, out of sight, and away from control during a great portion of the day, only being seen every two or three hours or so, and it requires that discipline should be maintained in a proper way to insure safety as well as order.'

14,325. Do you find by experience that this insubordination in your judgment endangers the safety of the pit, or makes it very much more difficult to provide for the safety of the pit?—I would not say that it makes it very much more dangerous, but I think that it tends to increase the danger in some cases.

14,326. (*Mr. Mathews.*) Supposing that that operation were to be extended, and that the union were to say in any considerable number of instances, "We oblige you to take these men back," though you were satisfied that they were not fit for the work, and there were an explosion, should not that relieve you from responsibility?—It ought to do so. I was going to illustrate that by referring to a few cases (which have happened not very recently) of punishing men for damage to the safety lamps, and discharging them on account of damage having been done to the lamp, damage that was thought to be careless and not merely accidental.

14,327. (*Mr. Harrison.*) Or intentional?—No, I do not know that I ever met with a case where it was intentional, but cases where it was exceedingly careless, and where we thought it amounted to such an offence that the man ought to be discharged. We have known cases where that has been interfered with, and where we were obliged to have a deputation from our own men to urge that that man should not be dismissed. And your time in such a case may be taken up every day, for weeks together, when the evil is very rife.

14,328. (*Mr. Roebuck.*) Do you know any case in your experience of a man having been properly discharged for damaging his lamp, and in which when it has been explained to the men they have not been satisfied, but have said, "You ought to take that man back again"?—No, I have not known that in any case, and recently, especially since the last year's accidents in Wales, I really think that the men have very much improved in aiding us in having the lamps attended to safely.

14,329. They have grown wise by experience?—I think so.

14,330. (*Mr. Harrison.*) We are not to understand you to say that the power of the union is habitually exerted to compel you to employ inefficient, careless workmen?—No, but this is what happens. We know from experience that you never can know for a certainty who the man is that would be considered by the union as a victim if you discharged him for any fault, and therefore you are exceedingly chary about discharging a man. You do not want your colliery stopped, nor do you like to submit to the consequence of being told by the leaders of your own union, You must take that man back or have your pit laid idle. You are exceedingly cautious, too cautious I think, in discharging a man even where it is necessary, because you know that the union are apt to interfere with it, and are apt to take the view that he has been discharged because he is a union man. Frequently in our district they have paid what they call victim wages, and they have kept a man loitering about for weeks together on those victim wages. I have kept men for years at the Holmes Colliery that I do not think worth keeping, to the great injury and cost of the colliery, and I would not keep them in the capacity of ordinary workmen were it not that if I were to discharge them the men would say that they were victims to the union.

14,331. But if they are all members of the union that cannot apply?—They think then that the man discharged is some active member, some committeeman, or some person that has been extra officious. I have been sometimes astonished when they have named as being victims, and considered to be victims, men that I had no idea were active men in the union; but that shows how careful we have to be in discharging them. A short time ago, immediately after Christmas, the foreign trade of course fell very slack, and we decided on stopping a considerable quantity of very expensive work that was necessary, and would be necessary, but we considered we could not afford it at the time and should let it hang over. We gave notice to I think 50 or 60 persons that we had thus to spare. Some of them (I should say perhaps a third or a half, I forget exactly which) were colliers. Well after we gave the colliers notice I think we had the pit laid idle one day, and then the men came and we had the matter talked over, and they expressed themselves as thinking that these men were discharged on account of the union. I said, "I am very sorry that you take these views of things, but to prove to you that it is not so, if you will share the work that there is left among you with these men, if you can contrive any way to take these men in with you so as to let them share it, I will take every man back," and we did so ultimately. But that shows the suspicion that is exercised on the part of the union over discharging the men, and the great caution that is required.

14,332. You think it would be better that the power should be exercised irresponsibly?—By the managers of the colliery. They are the responsible persons, they are held to be responsible by the state and by the public, and they have their own property at stake and that of the persons whom they represent, and they are certainly the responsible persons in the end.

14,333. (*Mr. Roebuck.*) You think that responsibility quite sufficient to make them do their duty?—Yes.

14,334. (*Mr. Booth.*) The master is also responsible to the law with reference to keeping the agreement he has made with the workman?—Yes.

14,335. You think that that is sufficient without his being responsible to a union?—Yes; I think that the union is the worst possible tribunal for him to be we have had frequently happen) and you have the

Mr. P. Cooper.
21 April 1868.

responsible to. The judge is biassed in favour of his own fellow-workman, the man who pays him, and I think there can be no worse tribunal to submit a case to than a tribunal of that sort. I have had to do it over and over again. I have had to explain with the greatest possible care and minuteness every detail to get them to a correct view of the case.

14,336. (*Mr. Mathews.*) You think that the law in the first instance and the public opinion in the next constitutes quite sufficient responsibility for a coal-owner without his being responsible to a trades union?—I think so. If we are to have any further responsibility I think it should be an independent tribunal.

14,337. (*Mr. Booth.*) I think I may collect that the general result of your experience with regard to the operation of the union in your neighbourhood is this: that though it may have led to a rise of wages in some particular cases, which rise otherwise would not have taken place, yet that on the whole it has prevented the development of the trade, and in that way prevented a general rise of wages?—Yes, I think so. In some cases it may have anticipated a rise which would have naturally followed and been more permanent. No rise can be maintained in my opinion if it is artificial and not the natural result of the state of trade.

14,338. (*Lord Elcho.*) You said that this rise arose in your colliery from some particular circumstances, and as to other collieries you said, I think, that there had been a rise there also, though not a general rise?—There has been a general rise in the South Yorkshire district once or twice during the last six years; once I know for certain there has.

14,339. I am speaking more particularly of these special advances. You said that your own colliery had been singled out, but then I thought you went on to say that other collieries were somewhat similarly situated and had to raise their prices?—That is the invariable result. Whoever takes the first step the others have to follow.

14,340. So that all the other collieries in the neighbourhood which have this peculiar system have had to raise their prices?—Yes, or to abandon the mode of working.

14,341. (*Mr. Roebuck.*) You used a word just now which I want to ask you to explain. You talked about a tribunal that might arbitrate the matter. Now, do you think it possible to establish any tribunal of arbitration that should arbitrate disputes between the manager of a colliery and the colliers who work it?—Yes; I do not see why there should not be or could not be. I should as soon appeal to you or any independent gentleman not acting in the capacity of magistrate for the decision in any case as to a magistrate, and sooner.

14,342. (*Sir D. Gooch.*) Does not it require technical knowledge as to the working of collieries for the decision to be of any value?—So it does if the case is before a magistrate.

14,343. (*Mr. Mathews.*) But supposing the arbitrator were to decide, when the question was referred to him, that the coal-master should pay a higher rate of wage than he had been paying, is there anything to prevent the coal-master from saying, "It "would not answer my purpose to carry on the pit at "that rate of wages, and I shall stop it rather than "do so," and would not that render the decision of the arbitrator an entire nullity?—Yes, but I did not refer to disputes of that character relating to wages, but rather to disputes arising out of existing agreements and arrangements—local disputes.

14,344. (*Mr. Roebuck.*) I want to know whether from your experience you would agree that there could be a tribunal created that could so arbitrate between the men and the master. Supposing, for example, the men said to the master, "You have a rise in the price of coal, and we want a rise in wages," I want to know whether there is any tribunal which could say to the master, "You must raise your wages 6*d.*," if the master says, "I cannot do it; it would ruin me." Do you think it possible that there should be an institution that should compel that master to do that which he says would ruin him?—No, I should not advocate that. I should not advocate any legislative or judicial interference with the rate of wages.

14,345. Then again, I put this to you. The masters are a small body; they could be got hold of, and they might be subject, we will say, to an arbitration bond, but the workmen are numerous. Do you think it possible by any mode whatever to make the workmen responsible by an arbitration bond?—No, I do not think it would be possible, because you have them in South Yorkshire one day and you have them perhaps in the county of Durham the next, and in the course of a fortnight, if trade be good, perhaps they are in Scotland.

14,346. Therefore the masters and the men do not come under equal circumstances before a tribunal of that kind?—No, I think not, nor do I see my way clear to recommend any sort of arbitration on the general question of the rise or fall of prices or the general question in any way; but I say that I should rather take an independent arbitrator than take an interested arbitrator, especially when that arbitrator may be a secretary, or committee-man, or union leader, who naturally must have a bias towards those with whom they co-operate.

14,347. Then I want to know what is the tribunal to do. You must know perfectly well that there is a great talk about arbitration and submitting matters to arbitration, and there is a noble Lord at this table who is a great friend to arbitration. I want to know whether in your opinion arbitration is possible?—Not, I think, as to the rate of wages.

14,348. In what questions is it possible?—As to the fulfilling of engagements without appealing to a magistrate, I think perhaps in some cases it might be found to be a sort of friendly suit.

14,349. That is to say, you think that a better mode might be adopted of adjudicating in those cases?—I think it might be done in a more kindly way perhaps by some such mode, in case of minor disputes.

14,350. Do not you think that that is a very small matter to reduce the whole question to which is now so much talked about of arbitration between masters and men?—I think it is an exceedingly small proportion of the question, and I do not think that any arbitration could possibly operate permanently on or arrange the prices of labour.

14,351. Further than that I want to know is there any case in which you could make the men really responsible under an arbitration bond?—No, I do not see how it can be done.

14,352. Then how could you possibly institute an arbitration court?—I do not think it would apply to serious cases like an advance or a reduction of wages.

14,353. What I want to know is this, how could you in any case bring the master and men upon an equality in the case of an arbitration bond (I want to reduce the matter to a point), and make the men subject to the decision of the arbitrator. You say that the workman may be to day in South Yorkshire and to to-morrow in Durham, and the next week in Scotland. I want to know how you can possibly make that man subject to a tribunal by his own decision beforehand, so as to bring him on an equality with his master who is bound to his pit, while everybody knows that the workman is a wandering animal, that you never can tell where he is or what he is?—I think that is perfectly correct, and that is the point where the arbitration fails.

14,354. (*Lord Elcho.*) You said that a man might be in South Yorkshire to day and in Scotland next week, but would all the men of the pit remove to Scotland?—No, I do not think that the whole of the men would emigrate at one time, but they can quit the colliery at any time by a month's notice.

14,355. So that as regards emigration that might affect a few; they might go or might hold out, but the mass do not move, and the mass might agree. That is practically what might happen and would generally happen, is is not?—The mass might agree.

14,356. The mass might either differ or agree, but

the mass would remain?—Yes, I think so. I think that half or three-fourths of the men would not remove hastily from the district, still it leaves individual workmen in the same way, they can leave at any time.

14,357. In such a case of arbitration do not assume that there is a bond or any legal power to enforce the arbitration, but do you not believe (and as I understand it it only goes this length, in the view of some who take an interest in the matter) that if there was a dispute between the master and the men, and the question was submitted to some independent person, although there might not be any bond or power of enforcing such a decision, yet the decision of that person upon the question in dispute would have a moral influence upon the men or the master?—I think it is quite possible that it might, and possible that it might not. It depends upon the confidence of the different parties, and the capability of the arbitrator for judging the thing. But if they have confidence in his being sufficiently acquainted with all the circumstances of the case it might succeed.

14,358. I assume of course that the person selected is a person selected with the concurrence of both parties, and that they both have confidence in him?—Then I think it would be a sort of friendly law suit and would settle the thing in a friendly way, and have its advantages.

14,359. Now let us assume this sort of case, that there is a dispute in a district, that there is a threatened strike, but that before a strike takes place, and before any bad blood is raised, certain representatives of the masters and certain representatives of the men meet together without an arbitrator. Do you think that such a meeting as that might have a good effect and tend to prevent bad blood and a strike?—Yes, in some cases. I was going to say that that which you now name used to be and is now at the present time not an unusual mode in the north of England collieries. If a dispute arose, not about the general rate of wages in the district but about the rate of pay in some section of a colliery, which the men thought was worse to work in than the rest, and that therefore the men there ought to be paid more, the thing became discussed and there was some difference of opinion about it, and in the end they very often agree that three persons ought to be chosen, two viewers, one of whom was chosen by the men and the other by the masters, and a third person as an umpire, and they went down and viewed the place and gave their opinion, and generally it was accepted.

14,360. (*Mr. Mathews.*) That is in case of piece-work?—Yes.

14,361. (*Lord Elcho.*) You cite that as an instance of the principle of an amicable meeting betwixt masters and men to decide a disputed point?—I have known it frequently adopted.

14,362. Where?—In the north. I have heard of one or two such cases in Yorkshire since I came into it.

14,363. In those cases did the union take any part either for or against such a proceeding as that?—The colliery itself in Yorkshire was in the union, in other cases in the north of England it was independent of the union altogether, indeed when there was none.

14,364. But such a proceeding as you describe has taken place in a colliery where there was a union?—Yes, there has been one case in Yorkshire to my knowledge.

14,365. Was that proceeding at all opposed by the union or supported by the union?—It was not opposed by them for they selected their man.

14,366. (*Mr. Roebuck.*) Can you give us the names?—The person chosen by the men is Mr. Wilson, a viewer, at Darfield Colliery, near Barnsley. The dispute was at Snydale Colliery, near Pontefract.

14,367. What was the dispute about?—About the rate of wages. Of course the men wanted more than the masters thought proper at the time.

14,368. What was the result?—The result was that the workmen chose one viewer and the masters chose another, and they inspected some adjoining collieries working the same bed of coal, and they gave their decision. The result of the decision I do not know, but I was applied to to know whether in case of dispute I would be umpire in the matter.

14,369. (*Mr. Mathews.*) The question really was not as to a rise of wages, but as to whether the men could get a certain rate of wages by doing certain piece work at a certain price?—Yes.

14,370. It was left to arbitration to decide whether this certain price of piece work would realize the wages to the men or not, and it was not a question whether they should have a rise of wages or not?—That is so.

14,371. (*Lord Elcho.*) You do not know, perhaps, whether this question to which you have just referred embraced the whole colliery or only a portion of it?—No; but I think it was explained to me at the time that it was some increase in the thickness of dirt in the bed, either over a portion or over the whole of that colliery.

14,372. It was a question, however, which had led to a dispute, and which might have led to a strike?—I think so.

14,373. You have known strikes occur from les causes?—Yes.

14,374. You said that you were asked to act as umpire; did you consent to act as umpire?—I was applied to by one of the parties only, and I said that if the case became sufficiently ripe and they would come to me again I would give them an answer, but I heard no more of it.

14,375. From their not coming to you you assume that it has passed off quietly?—Yes.

14,376. Are you aware that in the lace trade of Nottingham, for instance, this system of masters and men meeting together instead of going to war at once and striking has had beneficial results?—Yes, I have.

14,377. From your knowledge of the coal trade have you any reason to believe that a system which has been found to work well in one very important trade where up to that time there had been very bad feeling and frequent strikes, would not work equally well in the coal trade?—I think it quite possible and quite likely, though I feel some little hesitation in saying so, that there is less knowledge possessed of the details and operations of coal mining by the general public, to whom such a thing might be referred, than there is of almost any other large class of manufacture or trade in this country, and therefore I see difficulty in getting persons possessed of sufficient knowledge of the facts and circumstances of the case to be relied upon.

14,378. But you misunderstand me altogether. As I understand the Nottingham case it is not at all the case of a question that is referred to the general public or to any special arbitrator, but it is the case of the masters and men appointing a certain number who meet together and settle these questions by discussion instead of settling them by dispute and strike. Now, I ask you whether (without taking any foreign arbitrator, as we may call him, or any man from the general public) you think there is any reason why a system which has worked well in the lace trade should not work equally well in the coal trade?—I see no difficulty in the masters and men meeting together, and it is a thing which I have always encouraged as far as possible.

14,379. But as there would be no difficulty necessarily in their meeting together, and they are both thoroughly conversant with the matter in dispute or under discussion, do not you think that it is, reasoning by analogy, probable that a system which has been satisfactory in one description of trade would be equally satisfactory in its results in another?—Excepting this, that if you go to the manufacture of iron or cotton or lace, or anything of that sort, you have far greater uniformity of material to deal with, and the production as well. If you go into a coal mine you have such a variety of circumstances in the same bed within a very limited distance that I think no special rule or arrangement could be applied generally, and I think there are certain objections

Mr. P. Cooper.

21 April 1868.

which indeed I have seen before to leaving it to two or three viewers referred to by both parties to settle the question. A person who was at an adjoining colliery, even if he was half persuaded or more than half persuaded, that an advance was required, might be influenced by the fear of it coming upon himself, and these little matters seem to be the only barriers. I do not know why there should exist much more difficulty in colliery matters than in any other matters.

14,380. But be that as it may, you can speak to this, that in cases where it has been tried in collieries it has succeeded?—Yes, it has worked satisfactorily.

14,381. And there is no reason why having succeeded in one case it might not be generalized a success in another?—I think that many local disputes not of a general character might be so settled. But I believe the great difficulty is that the men have not confidence in colliery viewers and managers as a rule, and therefore they cannot get a man that can arbitrate for them. I believe that on the whole the obstacle is more on the part of the workmen than on the part of the managers.

14,382. Some time ago you were asked a question with reference to the influence of the unions in promoting a reduction of the hours of children's labour, and also as regards the removal of women working in pits, and you said that that had been done without combination. Now, there is no doubt, I believe, that it was done without combination, but still might it not be possible that the beneficial influence of the union in that case might have been felt in Parliament in endeavouring to get the members to take an interest in the subject and effecting legislation in that way without having recourse to a strike?—I think the most remote influences may have produced some effect, but I question whether the efforts of the union have been directed to anything else than less work and more money, at least it has been very seldom, as far as my experience has gone. They seldom take up the question of education, for instance.

14,383. Should you be surprised to hear that miners' unions have at all directed their attention to those points, and that they have endeavoured to get that legislation to effect changes which they believe to be beneficial to their body in general?—There was a petition last year, I know, with sundry complaints, and stating sundry things that the miners thought were wrong. But what I did say was this, that I believe there have been more alterations made in the rate of wages and in the hours of working, independent of unions existing in the district where they took place, than there were where unions really did exist—that is my experience.

14,384. That is a question of wages, but I referred to such questions as the hours of children working in the pits and women working in the pits, questions of inspection and instruction, and those matters. I ask you, whether to your knowledge unions have had any influence in bringing about changes which have been proved by experience to be beneficial?—I have no doubt that they have had some influence, that is to say they have advocated several of these measures while they were under discussion, and perhaps they may have moved them in some cases; indeed, generally speaking, the working colliers have been advocates for inspection. I am not aware, however, that inspection was originated by the unions of colliers.

14,385. You cannot speak to that?—No, I do not recollect that it was, but I think they did advocate inspection, and I advocate it.

14,386. You said, that with reference to that rise in wages for some special mark at your colliery the result had been that less money was gained in consequence by the men, that is to say, less was paid in wages in the pit, and that therefore this rise in wages was merely nominal, because the men really had not more to spend amongst them than they had previously?—That is what I mean.

14,387. But your explanation of that was, that the men work less, and that it was done by piece work. They played more, they worked shorter hours, and they did not gain, but the contrary?—Yes, I have not the slightest doubt, and it has always been so in my experience. An advance in the ordinary scale of payment on piece work prices has always led to the workman working less, that is to say, less in proportion, and making really less earnings per week than he did before.

14,388. That is to say, that in consequence of this charge you pay less in wages than you paid previously?—Yes, but not less per ton of coal—less over a week or over a year, a smaller gross sum, but a very much larger sum per ton of coal raised.

14,389. Then did you raise less coal?—Less for the same number of men certainly.

14,390. But was not your object in making this change in the working to raise more?—If you refer to these special places, it was certainly not to raise more at the moment, but to open out a working area to employ the men when other working areas were finished and were done with.

14,391. In that you have succeeded?—We are doing it now.

14,392. So that you are reaping the benefit from it, and eventually the result will be perhaps that more wages will be paid by you?—We are reaping or shall reap a benefit, but I should like to put it in this way—we should have no objection to pay a fair tax on it, but we do not like to pay a prohibitory tax on it.

14,393. You consider this a prohibitory tax?—Certainly; it is not anything like a compensation for the disadvantage, it far exceeds anything like that. That we are quite willing to pay, but it is asked, and demanded and enforced in my opinion in order to prevent that sort of work under the idea, a mistaken idea, that it would restrict the general output of coal in the country.

14,394. With reference to that case of violence to which you referred, questions were asked you implying that that case of violence took place without any knowledge, cognizance, or approval of the union. You said that as regards the local union you of course could not say whether it was done with their knowledge and cognizance, but that they endorsed what was done by defending the person when he was tried—that was so, was it not?—No; I said that with regard to the general union they had not any knowledge, but as regards the local union I think they knew beforehand that that man was held obnoxious, and that he deserved this, that, and the other; indeed, I have heard their leading men, representatives whom they sent to me, say that a man who would not join the union deserved to be drowned, and I have known them throw men into the canal.

14,395. But as regards the leaders, you said that there could not be any proof brought of their sanctioning such things?—We had no proof that they had any definite arrangement to that effect. Some of the union leaders at our colliery were convicted and imprisoned for this case.

14,396. But you had no doubt in your own mind, and you think there could be no reasonable doubt in the mind of anybody, that they knew what was going on, but, at any rate, they expressed their approval by supporting the men?—Yes.

14,397. So that really as regards the local union that violence was approved and sanctioned because it supported the men?—Yes; I think so in these cases and others of ill-using the men because the men will not pay into the union.

14,398. So that the local union approved of that course?—I think the great majority of them did; they thought it served the man right.

14,399. Now as regards the general union, did the general union disapprove or take any steps to show that they disapproved of the local union defending the man who was prosecuted, and so far endorsing what had been done?—I do not call to mind that they in any way introduced the matter to me, or that I knew of that having been done.

14,400. The general union must have known, I imagine, of all these proceedings?—Sooner or later, there is no question, they would know of it, but perhaps

in the case of a colliery being laid idle a day or two they might not know at the time or they might. I really do not know.

14,401. Is the probability in favour of their having known of this act of violence, and of their knowing that it had been defended by the local union?—I should think that there is no doubt of that.

14,402. And you are not aware of the central union either at the time or subsequently having disapproved of the conduct of the local union in defending that act of violence?—No, I have no means of knowing that. I do believe, however, and I think it is only just and right to say so, that the secretary of the union would not approve of it. Mr. Normansell is the secretary; he is here, and I think he would not approve of it, so far as I have heard him speak of such matters.

14,403. (*Mr. Harrison.*) The defence you speak of consisted, I suppose, in endeavouring to get these men a fair trial. When you say they defended them you mean in the way of paying for legal advice?—Yes, and supporting their families afterwards.

14,404. What do you think about the co-operative scheme which has been introduced by Messieurs Briggs. Have you considered it at all?—Not fully, I think, or with any very great care. I believe that the general opinion entertained by the people connected with it is that it is answering in their case, and that it is attended with benefit in their case. How it could be generally applied I really do not know. I fancy the men would be very glad to take any proportion of the profits, or every proportion of the profits sometimes, but how to get them to take a proportion of the risk or loss is the difficulty. I see that Messieurs Briggs have made some sort of statement that they would recommend two sorts of reserve funds to be formed to provide for seasons of loss, one of these to be taken from that portion of the fund which is set aside to go to the workmen and the other from that portion of the fund which is set aside to go to the capitalists, and to let these accrue for bad times, and take from them in some proportion in such bad times.

14,405. (*Sir D. Gooch.*) Have you any knowledge whether trade unions exist at Nottingham where these arrangements as to courts of conciliation have been made?—I do not know anything of that.

Mr. P. Cooper.

21 April 1868.

14,406. (*Mr. Harrison.*) Are you not aware that in many towns in England in certain considerable trades there has been now for some years established a code of working rules, which code includes hours of work and rates of payment, and in which there is no bond or any other legal liability whatever on either side, but which code of rules is in practice perfectly respected and followed out?—Yes, I believe it is generally the case that they have such a code of rules in manufactories, and it is very strictly the case in collieries in the north of England prescribing a definite and fixed period of work, it is only partially so in Yorkshire.

14,407. Then the want of legal liability and the difficulty of drawing up a bond is not an insuperable obstacle to there being a common understanding in a particular district, or a particular works, or a particular town?—No, I believe that these arrangements in the north of England have been the result of fighting in years gone by. It is the same system as has gone on in other parts of the country; they have quarrelled about the rates of wages and the time of working, and the time for beginning work and ending it, and the age of employing boys, until they have come to a sort of settled code or system, and any interference with that would not be permitted in any individual colliery. It would have to be general or it would not be entertained. The whole of the coal-owners for miles round would support any single colliery that was attacked in the way of interfering with a well understood and organized general arrangement. It is the natural result of these combinations of the workmen that they will produce combinations of the employers, and it is the only safeguard that the employers have, and I do not think that either arbitration or ordinary means, or anything else, is of much use to them. I believe that the only resource is counter combination.

14,408. (*Chairman.*) Are there many places where there is a basis of wages and work agreed upon between employers and workmen?—Yes.

The witness withdrew.

Adjourned to Tuesday next, at 11 o'clock.

1, Park Prospect, Westminster, Tuesday, 28th April 1868.

PRESENT:

The Right Hon. Sir WILLIAM ERLE.	JOHN ARTHUR ROEBUCK, Esq., M.P.
The Right Hon. the EARL of LICHFIELD.	THOMAS HUGHES, Esq., M.P.
Sir DANIEL GOOCH, Bart., M.P.	FREDERIC HARRISON, Esq.
JAMES BOOTH, Esq., C.B.	WILLIAM MATHEWS, Esq.

THE RIGHT HON. SIR WILLIAM ERLE IN THE CHAIR.

Mr. JOHN CHAMBERS examined.

Mr. J. Chambers.

28 April 1868.

14,409. (*Chairman.*) Are you a proprietor of the Thorncliffe ironworks?—One of the proprietors.

14,410. How many men are employed at these works now?—About 2,500, that is taking the ironworks and the mines.

14,411. There are coalworks in conjunction with the ironworks?—Yes.

14,412. Is that a limited company or a private proprietary?—A private firm of the name of Newton, Chambers, and Company.

14,413. About how long have you been one of the proprietors?—32 years.

14,414. Have you had much experience of the action of unions among the working men?—Yes, for the last 10 years we have had a good deal to do with them.

14,415. Have you had many strikes during that time?—Yes; I have only particulars of strikes that have taken place since 1858. We had a strike in 1858 and another strike in 1860.

14,416. Were those strikes for rise of wages or to stand against lowering the wages?—That in 1858 was a stand against reduction of wages. There was a depressed state of trade, and we asked for a reduction and the men resisted it.

14,417. Definitely what was the question, was it 10 per cent. or 15 per cent.?—I cannot exactly tell. I should think it would be something like 5 to 7½ per cent.

14,418. And was it at a reduction of wages pervading the district or a proposed reduction for your works only?—A proposed reduction for our works only; at least I had no communication with any other parties.

14,419. Then it was an isolated question between the proprietors of these works and the workmen on these works?—Yes.

14,420. How long did that strike last?—It begun on the 12th of January and terminated on the 30th. It was a short strike.

Mr. J. Chambers.

28 April 1868.

14,421. Did the men succeed to prevent a reduction?—No, we succeeded in getting the reduction. It was a time of depressed trade as the present is.

14,422. Had you discussions with the men on the subject?—Yes.

14,423. What was the nature of the discussion; did you address them entirely as reasonable men explaining the reasons of your conduct, and asking them whether they understood those reasons and could answer them, was it that kind of discussion?—That was the kind of discussion. And after standing the time that I spoke of they accepted our terms.

14,424. You explained your reasons, that explanation was accepted by the workmen, and the reduction was accepted by them?—Yes.

14,425. Was there action of union there; I call it action of union when a secretary and delegates are present to represent on one side the union and the employers meet them on the other?—In that case we had no communication with the executive of the union, but I believe that many of the men were in the union.

14,426. I was just going to ask you whether it was ostensibly a strike guided and sanctioned by a union, or whether it was a strike by working men actuated by a sense of their own private interest?—I believe that the union men consulted the executive of the miners' union on that occasion, but still we had no communication with them at that time.

14,427. And therefore as for saying what the action of the union was, probably you have not sufficient knowledge to do that?—Not at that time. I got more knowledge of the union afterwards.

14,428. What was the next strike?—In 1860.

14,429. How long was that for?—It begun on July 15th and terminated on October 1st.

14,430. And what was the question between the men and the employers on that occasion?—I have no particulars of that strike.

14,431. Perhaps your memory reminds you that there was a question about wages between the employers and the men, and after a strike it was settled without any remarkable incident?—Yes it was so.

14,432. Was it a standing against a reduction or a claim of rise?—It was a stand made by ourselves against advance of wages.

14,433. (*Mr. Roebuck.*) They asked for an advance and you refused it?—Yes.

14,434. (*Chairman.*) And was the termination of the strike successful to the employers?—I believe it was a compromise.

14,435. Have any of them been strikes in which there has been the action of a union pervading the district, if I may so describe it?—The plan of the union in the district at that time was to take, say two collieries at once and give notice and get the advance. They would take two of the weakest, or those that they could most easily persuade to give up the point, and then when they got it at two collieries they would come to two others and go round the district. That was the plan adopted in 1860.

14,436. In 1860 then there was an action of union in that way, because that is what I call the action of a union pervading the district. They took notice of the state of the district, took notice of those they considered the weakest collieries either in firmness of nerve or in moneyed resources, and then commanded a strike at those collieries, which were either ruined or had to give in, and then they proceeded to the next. It was that species of strike as I understand you?—Yes, that was the plan adopted, and it led to a union of masters which was established in 1860 to resist that mode of of operation.

14,437. To what extent did the masters come into a union?—There would be 16 or 18 collieries in the first instance that did so.

14,438. And each of those collieries having between 2,000 and 3,000 men or more?—They would vary very much; some would be smaller ones, perhaps not employing 100 men, and others would have 2,000 or 3,000. There are very few, I think, in South Yorkshire where they have 3,000. Perhaps 1,500 would be the usual number, varying, and so up to 2,000 I should think.

14,439. (*Mr. Roebuck.*) Could you tell us, taking all the 16 collieries together, how many men there were employed by the whole of the collieries, have you any means of answering that question?—I have not got those particulars.

14,440. (*Chairman.*) Do I rightly understand that you were selected as the colliery against which they would strike at first?—Not at first. I think the first party selected was Sturges, Paley, and Mason. It began there in April 1860.

14,441. Did they come to terms with the men?—No, it terminated in a lock-out. After that colliery had stood 12 weeks and been supported by the masters' union, they determined upon a lock-out throughout the district, at least all the collieries that there were in the masters' union did so, and they locked out some 8,000 or 10,000 men, I think, at that time. It is so long since that I am scarcely prepared to give an accurate statement.

14,442. They locked out all the men in the district, and they stood out till 1st of October, did they?—My men went out on a quarrel about some new rules which I had introduced. That made it go to the 1st of October, or else the general lock-out terminated on the 9th of August.

14,443. It began with a single colliery or one or two collieries in April?—Yes.

14,444. Then there was a general lock-out and the termination of it was early in August?—Yes. Smith, Carr, and Smith I see was one of the firms where the strike began first.

14,445. On that occasion was the rise obtained by the men?—No, they were only asking advances at particular collieries, and the lock-out was terminated on the 5th of August and several of the collieries after that were still on strike, and in the end there was our colliery, Lundhill, and that of William Day of Barnsley. They struck on account of certain rules that we introduced; we withdrew those rules, and the men went in again, but did not get an advance of wages.

14,446. Will you give me just an example of the rules, was it so many hours a set working underground; was it about the hours at all?—No it was a mere little alteration in the colliery rules which we thought was an advantage to the men in the colliery. We have rules by which the colliery is governed.

14,447. That means that the working men are governed as to hours and wages and so on?—And conducting the pit.

14,448. There was some matter of detail about the way of working in the pit and the men were dissatisfied and they struck against it?—Yes that was it, and those rules were withdrawn, so that they got what they wanted, which was of no consequence to the proprietors.

14,449. A matter which you thought was for their advantage, they thought otherwise, and you allowed that their opinion should prevail?—Yes, we gave up the point.

14,450. Have there been any later strikes that you have had?—One in 1864.

14,451. (*Mr. Booth.*) With regard to such of these strikes as were for a rise of wages did any of them succeed on the part of the men?—In this case they did not succeed but some of the collieries against which they struck were out for a considerable period.

14,452. The strike of which you have been speaking was for a rise of wages I think I understood?—It began with a demand for rise of wages and did not succeed in that instance.

14,453. Is it your experience that strikes for a rise of wages are generally less successful than strikes to resist a fall?—They have been successful as a rule when trade has been in a prosperous state.

14,454. Those are strikes for a rise?—Yes.

14,455. But as to strikes to resist a fall have you known any of them to be successful. When the coal

owner has found it necessary to reduce the wages, in those cases have the strikes been successful?—As a rule they have not, or perhaps have ended in a compromise. Supposing we asked for 10 per cent. we may have got 5 in many instances.

14,456. (*Mr. Roebuck.*) Then do you make it a rule in such instances to ask more from them than you really expect to gain?—We do not make it a rule.

14,457. I suppose that you generally ask the men to have their wages reduced to a point that will enable you to make your ordinary profit?—Precisely; that will enable us to conduct our ordinary business and meet the competition of the market.

14,458. That being the case your asking for a fall of wages you say usually happens when there is a bad state of trade?—Yes.

14,459. In that bad state of trade have you ever known the men succeed in resisting a fall which has been suggested by the state of trade?—Very rarely; generally they have not succeeded.

14,460. (*Mr. Booth.*) The strikes for the rise of wages have been generally more successful than those to resist a fall?—Yes, I should say they are.

14,461. (*Mr. Roebuck.*) Does not that suggest the idea that the masters resist a rise rather improperly upon occasion?—It would bear that construction, no doubt.

14,462. Bearing that construction, do you agree with the construction?—I think that sometimes the men ask an unreasonable advance.

14,463. You think that sometimes the men ask more than you can afford to give?—Yes.

14,464. On those occasions there is a resistance, a justifiable resistance, on the part of the masters, you would say?—Quite so.

14,465. I am asking you now whether in your experience there have been occasions where men have only asked a reasonable rise and they have been opposed by the masters?—Do you mean by the masters in combination.

14,466. Or in any way?—Well there are masters that are unreasonable in that way, but I think that masters in combination would not make that error.

14,467. (*Chairman.*) Are the wages in your works paid by the quantity raised or some principle of that sort?—Yes.

14,468. Not by the day?—No, they are paid by the quantity.

14,469. (*Mr. Roebuck.*) Are all the men paid by the piece?—All the working colliers are paid by the piece, but we are compelled to have day men to attend to other matters.

14,470. (*Chairman.*) Is the same rate fair for all collieries in the whole of a district. Is not the work of a very different nature in one colliery from another, and the quantity of profitable coal much greater from the same quantity of work in one colliery than in another?—There is a great difference in the amount of labour needed to produce a ton of coal in one place as compared with another, even in the same colliery. I have places where a man would earn more money at 1*s.* a ton less than he would in other places. So that any fixed rate for a single colliery per ton is an unfair mode of dealing with the question.

14,471. My question was directed to that point, the striking for the same rate over a whole district. Probably that is never done, but one colliery would settle its wages and there would be a proportionate reduction over the other collieries?—No, generally they go for a uniform advance of 5 per cent. or 10 per cent.

14,472. But that is upon a ratio, a proportionate advance?—Yes, the last strike that occurred we were asked for 10 per cent. and it ended in 5 per cent. being given.

14,473. (*Mr. Roebuck.*) What year was that?—That would be in 1866.

14,474. (*Chairman.* A demand at your colliery do you mean?—No throughout the district.

14,475. There was a proposal on the part of the men in 1866 that they should have a rise of 10 per cent?—That was through the district.

14,476. That must have been the action of union then?—Yes.

14,477. The working colliers throughout the district were for the most part union men, were they?—There was a large proportion of union men.

14,478. And throughout the district there was a proposal made by the union that the wages throughout the district should be raised 10 per cent.?—Yes.

14,479. And had the masters combined action—was there a union of masters?—There was a small union of masters combined, but it did not include the whole district; but ultimately 5 per cent. was conceded through the district.

14,480. They asked 10 per cent. and 5 per cent. was the sum conceded. Would that 5 per cent. in your judgment have been obtained by the men, by the voluntary action of the masters, if no union had intervened?—Well, that I cannot say.

14,481. Have you in many cases where there has been an increase of demand and an increase of the price of coal known a rise of wages volunteered?—There is no doubt that the wages have been put up by a scarcity of labour.

14,482. That is what my question came to. There had been an increase of demand for coal, you want more coal supplied, you get it by increase of working; you have a demand for more working men, and you get your supply by increasing the wages; you have known that action often?—That is so in the operation of all works; in our works we find it so.

14,483. Universally, I suppose, that applies—if there is an increase of demand for working men the supply is obtained by an increase of wages;—That is so in my experience. There is no doubt that the unions have succeeded in putting up the price of labour more than it would have gone up probably if there had been open competition and if there had not been any union action.

14,484. In what way have the unions put up labour in the manner you now allude to? According to your statement it must have been by excluding competition. If there had been an open competition the wages would not have risen so high, you say, but by the action of unions the wages was raised higher; how is the action of the union shown otherwise than by keeptng out foreigners, other men, I mean?—Of course they make a demand, and succeed in obtaining it. Take the difference between South Yorkshire and Derbyshire now; in Derbyshire they work ten hours, and with us in South Yorkshire we work only eight.

14,485. (*Mr. Roebuck.*) Now, supposing you were to suggest that instead of working eight hours they should work ten, and the men resisted that, how would the men go to work; supposing they struck, what would they do?—They would remain out.

14,486. Supposing then you said "If you remain out we will get other men;" have you ever tried that?—They would not allow me to do that.

14,487. That is exacly what I want to come to?—I could just give you an account of the last strike, I think it would illustrate that, and be a pretty fair specimen of all the strikes we have had. There are some 20 strikes in all the South Yorkshire collieries that we have records of in our books in the masters' union since the year 1858. In November 1865, in order to obtain that reduction of 10 per cent. the colliers commenced working short time, that is, they did half a day's work at all the collieries throughout the district; well the coal owners thought that so foolish a thing, they would let it alone, and it went on till the 23rd of December, about the end of the year.

14,488. I think it would be better if you would answer my questions simply as I put them to you. Take this strike of 1865, what was the demand the men made?—10 per cent.

14,489. It was resisted by the masters?—It was resisted by the masters.

14,490. What did the men do?—They went on short time.

Mr. J. Chambers.

28 April 1868.

14,491. For how many hours did they work?—Half a day.

14,492. That is to say four hours?—Yes.

14,493. Then what did you do?—We allowed them to go on till the end of the year.

14,494. At the end of the year what did they do?—There was 5 per cent. conceded to them.

14,495. Did you in the mean time endeavour to introduce what are called foreigners?—No.

14,496. So that there was no resistance on their part, as far as you know, to your introducing foreigners?—No.

14,497. Why did you concede that 5 per cent.?—Because the coal owners one after another gave way. I objected to that mode of raising wages at the time. I had some men earning such large wages that I said it was an injustice to the rest of the colliers.

14,498. Explain to me how it was a rise of wages. You say that you pay them by the piece?—Yes.

14,499. They chose to work only half a day?—Yes.

14,500. But you still paid them by the piece?—Yes.

14,501. How was that a rise of wages?—They got 5 per cent. after that.

14,502. On the piece work?—And day work too.

14,503. The cause of your granting that was that you did not want so little to be raised from your pits as could be raised by half-time work?—That was the cause.

14,504. Granting 5 per cent., did you make the usual rate of profit?—Well, we put up the price of coal, of course.

14,505. Did you succeed in keeping up the price of coal?—Yes.

14,506. Then were not the men justified in making the demand?—Well, it is for the consumer to say that. I think in the end it would damage trade.

14,507. (*Mr. Mathews.*) Was the coal trade good at the time you gave them that concession of 5 per cent?—Yes.

14,508. And in consequence of the coal trade being good it was inconvenient to you to allow the men to work half time?—It is always inconvenient to work half time. They went in every day, but they only did half a day's work, and of course that was a loss to us. Then we had our draymen, banksmen, screenmen, &c., to pay the full time, and horses and machinery, and so on.

14,509. If ordinary colliers restrict their operations to half a day's work in the day, the common charges for the carrying on the establishment make the cost of getting coal much dearer?—Yes, they threw them up 6*d.* a ton at once.

14,510. The coal trade being good at the time, you raised the price of coals, and gave the men an advance of 5 per cent.?—We gave them an advance at first, and then raised the price of coal afterwards.

14,511. How long did the demand continue so as to enable you to keep the price up at the advance?—Up to the end of last year.

14,512. Since then the price of coals has fallen?—It has fallen very materially.

14,513. And what steps have you taken in regard to the wages to meet the reduced price of coals?—We have asked the men very respectfully to concede the 5 per cent.

14,514. The 5 per cent. that you put on you mean?—Yes.

14,515. And what has been the result of that request?—I believe they have conceded it.

14,516. How much has the price of coal been reduced?—In some instances I have had to reduce coal 20 per cent., and in others 15 per cent.

14,517. Then the reduction in the price of coals is more than equivalent to the reduction in the wages?—Decidedly so.

14,518. So that now you are worse off in respect of your profits than you were previous to your advance 5 per cent. to the men?—Very much worse off.

14,519. Was the 5 per cent. you advanced to the men and the restriction of half-time work suggested by the union, or was it done irrespectively of the union?—No, it was union action.

14,520. What evidence have you that it was so—did the union officers interfere in the matter themselves?—They have club houses in the district, and when they have rules passed at a general meeting they are carried out at the different club houses. Resolutions are made, and then they go and act upon them at the pits.

14,521. Are the club houses under the control of the union officers?—Yes; they are the local clubs in connexion with the general assembly, and which have delegates to go to the general assembly at Wombwell.

14,522. Then the local clubs in fact are branches of the general union?—Yes, they are branches.

14,523. (*Mr. Roebuck.*) Did you negotiate the matter with the delegates or with your own men?—I did in the end with the delegates, because I thought that I could manage the delegates better than the men.

14,524. You negotiated with the delegates from the union?—Yes, I have done so recently.

14,525. And do you find that a more useful mode of communicating with your men than communicating with them direct?—Well, I have found it to answer.

14,526. I mean, do you find the delegates more amenable to reason than the mass of the men?—They have better information many of them, and know more about the trade of the country, and study more political economy than the working men do.

14,527. Then you in fact consider that the delegate is a better instructed man than perhaps the mass of the working men?—Yes.

14,528. And therefore you found him more amenable to your reasons?—Quite so.

14,529. Therefore there is really an advantage in corresponding with the delegates in preference to the men?—Well, there is in the present state of things.

14,530. (*Mr. Hughes.*) And do you think that there is likely to be in the future state of things?—I think that legislation ought to step in and do something for the protection of the trade generally, so that we might not get into those awful collisions, because that strike which I am speaking of cost the union not less than 5,000*l.*, and I paid wages to the tune 15,000*l.* less than I did in the previous years, so that the men lost 20,000*l.*, which will take 10 years at 5 per cent. to repay.
